HASTINGS, WARREN, gov.gen. of India, b. Dec. 6, 1732, was descended from an ancient family long settled at Daylesford, in Worcestershire. He was early left an orphan; but when only seven years old, he resolved to recover the manor and estate, which had passed out of the possession of his family. He was sent to Westminster school, and promised to be one of the first scholars of his age, when, at 17, he was sent out to India as a writer in the East India company's service. Having realized a moderate fortune, he, in 1764, returned to England. In 1769 he again visited India, on his appointment as member of the council at Madras, and in 1772 was promoted to be president of the supreme council of Bengal. A year later, parliament enacted that the chief of the presidency of Bengal should be styled gov.gen. of India, and that Hastings should be the first gov.general. The finances of his government were in a disordered state, yet the demands of the East India company for money were incessant. His first step was to wrest certain rich provinces from the great mogul, and to sell them to Sujah Dowlah, the nabob of Oude. The Rohillas resented the transfer to a cruel master, and Hastings, for a money consideration, infamously lent the nabob the services of the company's army for their subjugation. The great brahman, Nuncomar, was put to death by his influence, in order to strike terror into the native population. He exacted vast sums from Cheyte Sing, the rajah of Benares, and finally confiscated all his possessions. He formed a treaty with Asaph-ul-Dowlah, the son of Sujah Dowlah, under which the mother and grandmother of the nabob, known as the begums or princesses of Oude, were to be stripped of their domains and treasures for the benefit of the company. These were the chief blemishes of his Indian administration; but against these are undoubtedly to be set off great public services. He was constantly trammeled by orders from home, and frequently borne down by an able and factious majority in council; yet he preserved the British empire in India from a formidable combination of foreign and domestic enemies. He acted with vigor when the war with France broke out; he broke the power of Hyder Ali; he organized a system by which justice was dispensed, the revenue collected, and peace maintained. He encouraged Asiatic learning. When he left India in the spring of 1785, that great empire was tranquil. A treaty had been concluded with Tippoo Sahib, son and successor of Hyder, and the Carnatic had been evacuated by the armies of Mysore. On his arrival in England, he was received with distinction by George III. and the court. The directors acknowledged his services by a unanimous vote of thanks. The whig opposition were, however, loud and vehement against him, and succeeded in carrying in the lower house a motion for his impeachment at the bar of the house of lords. The trial began in Westminster hall, Feb. 12, 1788, the managers of the impeachment being Burke, Fox, Sheridan, Windham, and Mr. Charles (afterwards earl) Grey. Burke opened the proceedings in a speech which was extended over four sittings; Mr. Fox and Mr. Grey urged the charge respecting Cheyte Sing; and Mr. Sheridan was intrusted with the conduct of the article relating to the princesses of Oude. The interest taken by the public in the impeachment began to decline after these great displays of rhetoric. The trial, notwithstanding, languished for upwards of seven years. On the 149th day (April 23, 1795), it terminated in the acquittal of Hastings. Out of 400 peers, only 29 voted. The last 24 years of his life were passed at Daylesford, where, in the pursuits of literature, and the occupations of a country gentleman, the evening of his eventful, stormy, and checkered career was serenely passed. He died Aug. 22, 1818, in his 86th year, and was buried behind the chancel of the parish church of Daylesford. Few students of English literature require to be reminded of the eloquence with which the story of his life and his memorable impeachment has been told by lord Macaulay.

HAT, a well-known species of head-covering, which has assumed various shapes and characters. What we understand by a hat is a fabric of felt (q.v.), or a silk material used as a substitute for felt. Hats are only a variety of the still more ancient cap and bonnet, and were at first made of velvet, silk, and other rich materials. Formed of felt, and assuming a certain firmness of fabric, hats began to be manufactured in England about 1510, and we hear of them superseding caps, or softer headgear, in the reign of Elizabeth. The felting of caps is, however, said to have been long known anterior to this period; and there is a tradition that a knowledge of felted caps or hats had been introduced by the crusaders. Wool was the material first employed in forming felt hats; but in time, as trade with America was developed, the fur of the beaver (q.v.), as finer and softer, came into use; hence, the term beaver was long synonymous with hat. For about three centuries, fine beaver hats, dyed black, and prepared with much skill, formed the head-covering of the higher classes in Great Britain; the middle and humbler

classes, still continuing, for a length of time, to use the less expensive caps and bonnets according to the fashions of their ancestors. See BONNET.

The growing scarcity of beaver-fur led to attempts to substitute a cloth formed of silk plush, drawn over a pasteboard frame, about 1810. These were not very successful; and hats of wool or beaver-felt were common until about 1840. The high cost of beaver at length forced on the improvement of silk hats, and now the beaver is almost entirely superseded; while the fabrication of silk hats has been carried to great perfection not only in England, but in continental countries and the United States. The silk hat consist of a body and rim, usually made of two or three layers of cotton-cloth saturated with varnishes, to give the fabric stiffness, and make it waterproof. These are molded on wooden blocks according to the fashion of the day; and when the desired shape is produced, the whole is carefully furnished over with lac and dammar varnish, and, before dry, the fine silk plush is applied with great nicety, so as to prevent the seams being perceived; it is then trimmed with silk braid on the edge of the brim, and a silken band round the junction of the body with the brim; and the lining of leather and thin silk being put in, it is complete. Lightness, gloss, and durability are the prime qualities of the silk hat; and in these respects the hats of New-York manufacture deserve a high commendation. Very excellent hats are made in London, Paris, and Edinburgh; but they are heavier than those of America.

As suggested by the whims of fashion (q.v.), hats have undergone a wide variety of changes of shape. The raising of the top part in which the head is inserted, and the widening or diminishing of the brims, have constituted the chief differences. Sometimes the top has been high and narrow, sometimes high and widened; and as regards the brim, it has sometimes been so broad as to be looped up. Political and religious differences have been marked by the form of hat. The Puritan of the reign of Charles I. adopted the steeple hat, high and narrow with a broad brim, and devoid of ornament, as the badge of his party. The Cavalier, during the same era, wore a lower and broader crown, with a feather stuck on one side. And a still lower-crowned hat, with a profusion of feathers, became the fashion in the reign of Charles II. The Quaker hat, low in the crown, with a broad brim, and quite plain, dates from the origin of the sect at the middle of the 17th century. A growing extravagance in breadth of brim led to the device of looping up the back and sides, and so was fashioned the cocked-hat which was worn by gentlemen throughout the 18th century. But in this cocked-hat era there were exceptions to the fashion. Beaux, by way of singularity, wore low-crowned hats with brims, and such must be considered the precursors of the present round-hat, which finally superseded every variety of cocked-hat at the beginning of the 19th century. The writer of this can recollect of only three persons wearing cocked-hats as ordinary attire as late as 1810. While cocked-hats ceased to be used by common soldiers at the reform of military costume consequent on the war with the French republic, officers in the army continued till a later period to wear that species of flattened cocked-hat known as the *chapeau bras*—that is, the hat which, by being flattened up, could be carried conveniently under the arm. This kind of hat was disused by regimental officers about 1812; but with slight variation in shape, it is still continued by field officers in European armies.

Light, handy, and, in effect, adding height to the stature, the common round-hat is easily damaged, and quite unsuitable for rough wear in traveling or when in the country. These inconveniences, as is well known, have led to the introduction of a variety of undress hats, black and gray, and some of them of felt almost as soft as cloth. Such are the wide-awakes, the Tom-and-Jerries, and an innumerable tribe of hats worn by sportsmen, tourists, and youths generally. With these exceptions, the round-hat, with slight changes of form from time to time as suggested by fashion, continues to be the hat proper, worn by all when in ceremonial dress. The only professional hat in England is that of clergymen of the established church. It is a round-hat of fine beaver, with a broad brim, which is looped up at sides and back, so as to form a kind of shovel. This is ordinarily known as the shovel-hat. During the 18th c., it was not unusual for the gentlemen to wear gold-lace bands and edgings on their hats. This, like some other fantastic decorations of attire, is now resigned to footmen and other domestic servants in livery, whose hats and other garments present a fair specimen of the dress of our foppish ancestors.

HATCH, EDWARD, b. Me.; early removed to Iowa. In the war of the rebellion he was a col. in command at New Madrid, Island No. Ten, and Corinth, and afterwards commander of a division in Tennessee. He was brig.gen. of cavalry in the contests at Franklin and Nashville, and in the pursuit of Hood's army. In 1866 he was made col. of the 9th U. S. cavalry.

HATCH, JOHN P., b. New York, 1822; a graduate of West Point; served in the Mexican war and against the Indians. In the war of the rebellion he was brig.gen. of volunteers, commanding cavalry in northern Virginia, and was seriously wounded at South Mountain. He was brevetted maj.gen. for gallantry. After the war he was made col. of the 4th (regular) cavalry.

HATCH—HATCHWAY. Hatches are square or oblong openings in the deck of a ship, forming the communications between one deck and another. The fore-hatchway

is usually close abaft the fore-mast, the after-hatchway between the main and mizzen masts, and the main-hatchway immediately before the main-mast. This last is ordinarily the largest, and through it goods are hoisted to and from the hold. In merchant vessels, and especially barges, there are frequently other hatchways, according to the nature of the cargo; indeed, in some craft, the whole deck consists of hatchways. When used for purposes of communication, a companion-ladder is placed from each hatchway to the deck below. These ladders are, however, generally limited to the fore and after hatches. As he emerges through the latter, in ascending to the upper deck, every officer and sailor touches his hat in token of "salute to the quarter-deck." When not so used, the hatchway is covered by a wooden grating which admits air and sufficient light to those below, while it protects men operating above from accident. During stormy or wet weather, these gratings are covered with tarpaulins, securely fastened, and the ship becomes water-tight. After an action by boarding, the conquered crew are often battened down in the lower decks, and then made prisoners as they are allowed to ascend through the hatchway one by one.

HATCHIE, a river which rises in the n.e. part of Mississippi, U. S., and empties into the Mississippi river, near Randolph, about 25 m. above Memphis, Tenn. It runs through a fertile cotton region, and is navigable by small steam-boats about 100 m. from its mouth.

HATCHMENT, or ACHIEVEMENT, the funeral escutcheon placed in front of the house of the deceased, or elsewhere, setting forth his rank and circumstances. It is in the form of a lozenge, and in its center are depicted the arms of the deceased, single or quartered.

The achievement of a *bachelor* represents his arms in a shield complete, i.e., accompanied with helmet, crest, mantling, motto, and any other external ornaments to which he may be entitled, on a black ground.

In the achievement of an unmarried lady, her arms are placed in a lozenge on a black ground, but without external heraldic ornaments except in the case of a peeress, when her supporters, robe of estate, and coronet are added.

The achievement of a husband whose wife survives, impales his arms with his wife's in a shield with the external ornaments to which he is entitled, the ground of the hatchment being, under his side of the shield, black, and under his wife's, white. If the wife be an heiress, her arms are not impaled, but carried in an escutcheon of pretense. The external ornaments are appended, except the insignia of any order of knighthood having a circle or collar, with which heralds do not consider it proper for a knight to encircle his wife's arms. On this account the achievement of a knight has two shields placed side by side, one containing the husband's arms only, encircled by the collar, ribbon, etc., of the order, the other containing those of husband and wife: the ground is divided perpendicularly in the middle of the second shield, and painted black and white. When the wife is a peeress in her own right, there are also two shields—the dexter containing the arms of the husband, with the lady's arms on an escutcheon of pretense ensigned with her coronet; the sinister lozenge-shaped with the lady's alone, and each accompanied with its proper external decorations. The ground is divided black and white in the middle of the dexter escutcheon.

The arms of a wife whose husband survives are impaled with her husband's arms in a shield, or, in the case of an heiress, borne on an escutcheon of pretense. There is no helmet, crest, or mantling, but a peeress is entitled to her robe of estate. The ground under the dexter side of the shield is white, and under the sinister, black.

The achievement of a widower differs from that of a husband, in the ground being entirely black.

The achievement of a widow differs from that of a wife, both in having the ground entirely black, and in the form of the escutcheon, which (except in the case of an escutcheon of pretense) is lozenge-shaped. The arms are encircled by a silver cordon or cordelière, the symbol of widowhood.

On the decease of the last of a family, a death's head surmounts the shield in place of a crest.

The achievement of a reigning king or queen, whether married or not, represents the royal arms complete on a ground entirely black. That of an archbishop or bishop has the insignia of his see impaled with his paternal arms, the whole surmounted by a mitre, and the ground is per pale ar. and sa. The dean of a cathedral or collegiate church and a king at arms, also impale the arms of office with their family arms. In the achievement of the wife of a prelate, there are two shields—the first containing the impaled arms of the see and the bishop, surmounted by a miter; and the second, the family arms of the bishop with those of his wife. The ground is all white, except that part which is under the arms of the wife.

The funeral escutcheon of Scotland, France, and Germany differs considerably from that in use in England; it indicates not merely the deceased's right to a coat of arms, but his gentility of descent. The hatchment is much larger, consisting of a lozenge above 6 ft. square; and the arms of the deceased, which occupy the center, are surrounded by those of the 8 or 16 families from whom he derived his descent, the paternal quarterings on the right side, and the maternal on the left. The deceased is not entitled to an

achievement unless all these families had a right to bear arms. On the four corners are death's heads and the initials and title of the deceased, the black interstices are powdered with tears.

HATFIELD, a small market t. of England, in the co. of Hertford, is situated on the slope of a hill, 7 m. s.w. of the town of Hertford. It consists of one considerable street, crossed by a smaller one; its trade is unimportant. The palace was once the property of the bishops of Ely, but, together with the manor, was seized by Henry VIII., and was afterwards successively the residence, before their accession, of Edward VI. and queen Elizabeth. Hatfield house, built by sir Robert Cecil, is a noble structure, and a fine specimen of Elizabethan architecture. The parish church is an old and interesting edifice of the 13th century. Pop., '71, of parish, 3,998.

HATFIELD, EDWIN FRANCIS, D.D., b. N. J., 1807; graduated at Middlebury college, and studied theology at Andover. He was ordained in New York in 1832; was pastor in St. Louis; then of the Seventh, and later of the North Presbyterian church, New York city. He was for a time agent for the Union theological seminary, and for many years clerk of the Presbyterian general assembly. He has published *Universalism as it Is; St. Helena and the Cape of Good Hope; The History of Elizabeth, N. J.; The Church Hymn-Book, with Tunes; The Chapel Hymn-Book.* He also edited *The New York Observer Year-Book* for 1871 and following years.

HAT MANUFACTURE (see HAT, *ante*). Until recent times hats were principally made by the process of felting, and as tradition ascribed the discovery of that very ancient operation to St. Clement, he was assumed as the patron saint of the craft, and the annual festival of the trade continues to be held on his day, the 23d of November. Felt hats are now made of three different kinds, plain soft, plain hard, and "napped" or "ruffed" felts. There is a great range in the quality of felt hats, the finer and more expensive qualities being made entirely of fur; for the commoner qualities a mixture of fur and Saxony wool is used; and for the lowest kinds wool alone is employed. The processes and apparatus necessary for making hats of fur differ also from those required in the case of woolen bodies; and in large manufactories, especially in America, machinery is generally employed for operations which at no distant day were entirely manual. In the smaller factories, and for special objects, the old hand processes are still in operation. Hatter's fur consists principally of the hair of rabbits (technically called coneys) and hares, with some proportion of nutria, musquash, and beaver's hair; and generally any parings or cuttings from furriers are also used. Furs intended for felting are deprived of their long, coarse hairs, after which they are treated with a solution of nitrate of mercury, an operation called carroting or *secretage*, whereby the felting properties of the fur are greatly increased. The fur is then cut by hand or machine from the skin, and in this state it is delivered to the hat maker. A considerable trade in rabbit fur for hat making is maintained between Great Britain and the United States. The silk hat, which has now become so co-extensive with civilization, is an article of recent general introduction. It was known in Florence about a century ago; but its manufacture was not introduced into France till about 1825, and its development has taken place entirely since that period. A silk hat consists of a light stiff body covered with a plush of silk, the manufacture of which in a brilliant glossy condition is the most important element in the industry; and in that manufacture the French and American styles are in large demand. Originally the bodies were made of felt and various other materials, but now calico is almost exclusively used. The calico is first stiffened with a varnish of shellac, and then cut into pieces sufficient for crown, side, and brim. The side-piece is wound round a wooden hat block, and its edges are joined by hot ironing, and the crown piece is put on and similarly attached to the side. The brim, consisting of three thicknesses of calico cemented together, is now slipped over and brought to its position, and thereafter a second side-piece and another crown are cemented on. The whole of the body, thus prepared, now receives a coat of size, and subsequently it is varnished over, and thus it is ready for the operation of covering. In covering this body, the under brim, generally of merino, is first attached, then the upper brim, and lastly the crown and side sewed together are drawn over. All these by hot ironing and stretching are drawn smooth and tight, and as the varnish of the body softens with the heat, body and cover adhere all over to each other without wrinkle or pucker. Dressing and polishing, by means of damping, brushing, and ironing, come next, after which the hat is "velured" in a revolving machine by the application of haircloth and velvet velures, which cleans the nap and gives a smooth, and glossy surface. The brim has then only to be bound, the linings inserted, and the brim finally curled, when the hat is ready for use. In all kinds of hat-making the French excel, and in such centers as Anduze, Lyons, and Paris the trade is very extensive and important. In Great Britain the felt hat trade is principally centered at Denton and other localities in the neighborhood of Manchester, and in America the states of New York and New Jersey enjoy the greater part of the industry. According to the census of 1870 the statistics of hat manufacture in the United States were as follows: Hat and cap establishments, 483; hands employed, 16,173; capital, $6,489,571; wages, $6,574,490; materials, $12,262,107; products, $24,848,167.

HAT MONEY, a small duty or primage paid to the master of a ship for his care and trouble over and above the freight. The right to it is regulated entirely by custom of particular ports. The name is probably derived from the payment being originally gratuitous, and given to the master on going round with the hat at the end of a prosperous voyage.

HATRAS', a t. of Hindustan, in the n.w. provinces, 33 m. to the n. of Agra, in lat. 27° 36′ n., and long. 78° 9′ east. Hatras contains, '71, 23,722 inhabitants, and has a considerable trade, more particularly in the cotton of the neighborhood. As a place of some strength, it was at one time prominent in the wars of the Doab; but on falling, in 1817, into the possession of the British, it was immediately dismantled.

HATTERAS, CAPE. See CAPE HATTERAS.

HATTI SHERÍF, sometimes called HATTI HUMAYUN—i.e., exalted writing, the name given by the Turks to every rescript of the sultan. The hatti sherifs are composed in the Turkish language, and written in the Arabian court-hand Diváni. Above the text, as a token of the authenticity of the rescript, stands the intricate flourish or mark of the sultan, usually in black, but sometimes in red or gold. This flourish is called tugra or rishâni sherif—i.e., exalted sign; and the functionary who superscribes it is called rischândschi, or the signer. The hatti sherif is irrevocable. That of Gulhana, promulgated by Abdul Medjid, Nov. 3, 1839 (renewed Feb. 18, 1856), which guarantees life and property to all subjects of the empire without distinction of creeds, has in modern times obtained the widest celebrity.

HATTO, the name of two archbishops of the see of Mainz, who have a somewhat conspicuous place in the history of Germany. The first of these was chosen archbishop of Mainz in 891, and died in 913.—The second archbishop of that name was a monk of the monastery of Fulda, and succeeded the celebrated Rabanus Maurus, well known in the history of the eucharistic controversies, as abbot of the monastery of St. Boniface, about the year 942. In the second expedition of the emperor Otho I. into Italy, in 961, Hatto was sent as his ambassador from Pavia to Rome; and after his return, on the death of archbishop William, he was raised to the see of Mainz, and continued one of the chief directors of the imperial counsels. Of his after-life, and of his personal character, the most opposite accounts have been given. By some he is represented as a zealous reformer, and an upright and successful administrator; by others, as a selfish and hard-hearted oppressor; and the strange legend of his being devoured by rats, which Southey has perpetuated in his well-known ballad of *Bishop Hatto,* is represented as an evidence of the estimate which was popularly formed regarding him. It is by no means improbable, however, that this legend is of a much later date, and that its real origin is to be traced to the equivocal designation of the tower on the Rhine, Maüsethurm, near Bingen, which has been selected as the scene of the occurrence. *Maüsethurm,* mouse-tower, is probably only a corrupted form of *Mauththurm,* toll-tower, a sufficiently descriptive name; but the modified form of the word might readily suggest a legend of mice or rats. The date at which the Maüsethurm was built is unknown, and it is far from certain that it is not much later than the time of Hatto. It was stormed by the Swedes in 1635. Archbishop Hatto died in 969 or 970.

HATZFELD, a small t. of Austria, in the Temeser Banat, is situated 24 m. w. of Temesvar, on the railway between that town and Pesth. The breeding of horses is here extensively carried on, and there is a large trade in corn. Pop. in '69, 7,981.

HAU'BERK, a twisted coat of mail, sometimes extending only as high as the neck, but more generally continued so as to form a coif, leaving only the face of the knight who bore it exposed. In early times, the sleeve of the hauberk sometimes terminated at the elbow, but in the 13th and 14th centuries it came down to the wrist, and very generally descended over the hand in the form of a glove, either one-fingered or divided. In the 14th c., the hauberk was worn under plate-armor. See HABERGEON.

HAU'BERT, an old term in feudal law, to denote the tenure of ward and relief.

HAUCH, HANS CARSTEN, one of the best Danish poets of the 19th c., was born at Frederikshald, in Norway, in 1791; graduated at the university of Christiania in 1821; and after having traveled through Germany, Italy, and France at the cost of the government, with a view of prosecuting the study of natural history, came to Copenhagen in 1827, and was appointed professor of physics at the royal academy of Soroe, in Denmark. This post Hauch exchanged in 1846 for the chair of northern literature in the university of Kiel, but on the breaking out of the Sleswick-Holstein revolution, two years afterwards, he was compelled to return to Copenhagen, where the dowager-queen, Maria Sophia, offered him an asylum at the palace of Frederiksborg, where he resided for several years; and on the death of his friend Oehlenschläger, in 1850, he succeeded him in the chair of æsthetics at the university of Copenhagen. Hauch's earliest attempts at dramatic composition—*Contrasterne* and *Rosaura*—which appeared in 1816–17, attracted very little attention, but his tragedies of *Tiberius og Bajazet, Gregory VII.,* and *Don Juan* (1829) at once established his reputation, which he fully maintained by his subsequent dramas of *Karl den Femten's Död* (the death of Charles V.), *Mastrichts Belejring* (the siege of Maestricht), *Svend Grathe* (1841), and *Marsk Stig* (1850), in which he exhibits great powers of individualizing character, and portraying the local coloring of the scenes

which he describes. Many of his pieces were translated by himself into German, and were represented with success at the principal theaters of Germany and Sweden. Hauch's dramatic epic, *Hamadryaden*, which belongs to the ultra romantic school, has met with less favor among his own countrymen than in Germany, where it elicited the commendatory notice of Tieck, Schubert, and other critics of note; but his *Lyriske Digte*, 1842 (lyrical poems), some of which are extremely beautiful, enjoy an undisputed popularity in Denmark. As a writer of tales and romances, Hauch showed considerable diversity of talent; the principal are—*En Polsk Familie* (a Polish family); *Slottet ved Rhinen* (the castle on the Rhine); and *Guldmagern* (the goldsmith, 1836–45); *Saga om Thorwald Vidfœsle* (1849); *Nordische Mythologie, Waldemar Seier* (1862), etc. His *Robert Fulton* (1853) is regarded as the most perfect of his works. Hauch was a voluminous contributor to current Danish and German literature, and in his own country his name is associated with a sharp literary contest, in which he took an active and not always a very dignified part against his countryman and brother poet, J. L. Heiberg. He died at Rome in 1872.

HAUGIANS, a sect in Norway, the followers of Hans Neilson Hauge (1771–1824). He was an enthusiastic revival preacher and so annoying to the regular clergy that they procured his punishment by fine and imprisonment. He held that the ministry is a common duty, and that ordination for the service is not necessary; that church creeds and confessions are of small account, but faith and works are everything, and he laid much stress upon strict discipline. The sect, though local, is still numerous.

HAUKSBEE, or HAWKSBEE, Francis, b. England about 1690; a natural philosopher, the earliest to note electrical attraction and repulsion, and to observe the production of light in a vacuum and in open air. He wrote *Physico-Mechanical Experiments on Various Subjects.*

HAUPT, Herman, b. Penn. 1817; graduated at West Point, and after obtaining his commission, immediately resigned from the army, and became a civil engineer, and in 1844 was professor of that science in Pennsylvania college. He was for many years engaged as first assistant engineer on the Pennsylvania railroad, and afterwards rose to be chief engineer, and a director of that company. He was chief engineer of the Hoosac tunnel. During the war of the rebellion he was chief of the bureau of military railroads. In 1875 he was general manager of the Piedmont air line railway.

HAUPT, Moritz, 1808–74; b. Germany; a noted philologist. On finishing his university course he devoted seven years to study of Greek, Latin, German, Old French, Provençal and Bohemian. In 1837 he became a teacher at the university of Leipsic, and his first lectures, dealing with such diverse subjects as *Catullus* and the *Nibelungenlied*, indicated the two-fold direction of his labors. He was chosen to the new chair of German language and literature, founded in his behoof, and in 1842 married Louise Herman, the daughter of his master and colleague. Having taken part in 1849 with Otto Jahn and Theodor Memmsen in a political agitation for the maintenance of the imperial constitution, he was deprived of his professorship. Two years later, however, he was called to succeed Lachmann at the university of Berlin; and at the same time the Berlin academy, which had made him a corresponding member in 1841, elected him an ordinary member. For 21 years he held a prominent place among the scholars of the Prussian capital.

HAUPTMANN, Moritz, 1792–1868; was well known as a composer, but of greater importance as a writer on the theory of music. He was educated as a musician, and under Spohr he studied the violin. His opera, *Mathilde*, was very successful, but it was not until he succeeded Johann Sebastian Bach, as cantor at the Thomas school of Leipsic that his genius as a teacher was universally acknowledged. His pupils, all more or less distinguished, cherished an enthusiastic admiration for him, and at his death Leipsic was in mourning. He embodied the result of many years' labors in his *Die Natur der Harmonik und Metrik.*

HAUPUR', a t. of British India, in the n.w. Provinces, in the district of Meerut, 20 m. s. of the town of that name. It is of considerable size, and had a population in 1871 of 14,294. Government has a breeding-stud here, which has obtained celebrity for the character of the horses passed into different branches of the service.

HAURAN, a district in Syria, e. of the Jordan and s. of Damascus. It is a volcanic region, and scattered over it are the ruins of a vast number of ancient towns. The land belongs to the government; it is fertile, but only grain is cultivated. Scarcely a tree can be seen. The country abounds in artificial caves which once served as cisterns or granaries. Eshmiskin is considered the capital, and is the residence of the chief of all the shieks. The people are chiefly Mohammedans and dress like the Bedouins. In ancient times the Hauran was one of the four provinces of Bashan.

HAURÉAU, Jean Barthélemy, b. France, 1812; after leaving college, became an editor at Le Mans. In 1848 he was made keeper of the manuscripts in the national library, and chosen a member of the constituent assembly. In 1861 he became librarian of the order of advocates, and president of the academy of inscriptions and belles lettres. Among his works are *De la Philosophie Scolastique; François I. et sa Cour; Charlemagne et*

sa Cour; and *Gallia Christiana*, a continuation of the Benedictine history of Christianity in Gaul.

HAURIANT, a term in heraldry applied to a fish placed upright as if to refresh itself by sucking air. Gules, three lucies (the ancient name of pikes) hauriant in fess argent, the arms of a family of the name of Lucy in Hertfordshire.

HAUSER, KASPAR, the foundling of Nuremberg, was found by a citizen of that town in the market-place, between four and five o'clock in the afternoon of the 26th May, 1828. He was dressed like a peasant-boy, and had with him a letter addressed to the capt. of the sixth regiment of horse at Nuremberg. Being conducted to this officer and interrogated, it soon became evident that he could speak very little, and was almost totally ignorant. To all questions he replied, "Von Regensburg" (from Regensburg), or "Ich woais nit" (I don't know). On the other hand, he wrote his name in firm legible characters on a sheet of paper, but without adding the place of his birth, or anything else, though requested to do so. Hauser was then, to judge from his appearance, 16 or 17 years old. Though short and broad shouldered, his figure was perfectly well-proportioned. His skin was very white; his limbs delicately formed, the hands and feet small and beautiful, the latter, however, showing no marks of his having ever worn shoes. With the exception of dry bread and water, he showed a violent dislike to all kinds of meat and drink. His language was confined to a few words or sentences in the old Bavarian dialect. He showed entire ignorance of the most ordinary objects, and great indifference to the conveniences and necessaries of life. Among his scanty articles of clothing was a handkerchief marked K. H.; he had likewise about him some written Catholic prayers. In the letter which he carried, dated, "From the confines of Bavaria, place unknown, 1828," the writer stated himself to be a poor day-laborer, the father of 10 children, and said that the boy had been deposited before his door by his mother, a person unknown to the writer. He stated further, that he had brought up the boy secretly, without allowing him to leave the house, but had instructed him in reading, writing, and the doctrines of Christianity; adding that it was the boy's wish to become a horse-soldier. The letter inclosed a line, apparently from the mother, stating that she, a poor girl, had given birth to the boy on the 30th April, 1812; that his name was Kaspar; and that his father, who had formerly served in the sixth regiment, was dead. Hauser was treated by the magistrates of Nuremberg as a destitute boy, and became the object of general sympathy. Binder, a burgomaster, exerted himself, in particular, to throw some light on the obscurity in which the origin of the young man was involved. In the course of many conversations with him, it came out that Hauser, from his childhood, had worn only a shirt and trousers; that he had lived in a dark place underground, where he was unable to stretch himself out at full length; that he had been fed upon bread and water by a man who did not show himself, but who cleaned and dressed him, and provided him with food and drink while he was in a state of natural or artificial sleep. His sole occupation was playing with two wooden horses. For some time before he was conveyed to Nuremberg, the man had come oftener to his dungeon, and had taught him to write by guiding his hand, and to lift his feet and walk. This narrative gave rise to various suppositions and rumors. Hauser was, according to some, the natural son of a priest, or of a young lady of high rank; while others believed him to be of princely origin, or the victim of some dark plot respecting an inheritance. Some incredulous persons believed the whole affair to be an imposition. On July 18, 1828, Hauser was handed over to the care of prof. Daumer. The history of his education is remarkable in a pedagogic point of view, as his original desire for knowledge, his extraordinary memory, and acute understanding decreased in proportion as the sphere of his knowledge extended. His progress was, on the whole, small. On Oct. 17, 1829, he was found bleeding from a slight wound on the brow, which he said had been inflicted by a man with a black head. All efforts made to discover the perpetrator were ineffectual. The incident excited a great sensation; Hauser was conveyed to the house of one of the magistrates, and constantly guarded by two soldiers. Among the many strangers who came to see Hauser was lord Stanhope, who became interested in him, and sent him, for the sake of his education, to Anspach. Here he was employed in an office of the court of appeal, but by no means distinguished himself for industry, and was gradually forgotten till his death again excited attention. A stranger, under the pretext of bringing him a message from lord Stanhope, and informing him of the circumstances of his birth, invited Hauser to meet him in the palace garden at three o'clock in the afternoon of Dec. 14, 1833, and stabbed him in the left side. Hauser had sufficient strength left to return home and relate the circumstances of his assassination, but died on Dec. 17, 1833. Compare Daumer, *Mittheilungen ueber Kasper Hauser* (2 vols. Nuremb. 1832); Feuerbach, *Kasper Hauser Beispiel Eines Verbrechens am Seelenleben* (Ansbach, 1832); *Allgemeine Zeitung*, June 3, 1875.

HAUSSMANN, GEORGES EUGÈNE, Baron; b. Paris, 1809; educated at the conservatory of music, and became an advocate. After the revolution of 1830 he was successively sous-préfet of Nerac, Saint-Girons, and Blaye, and under the presidency of Louis Napoleon, was préfet of Var, the Yonne, and Gironde. He was appointed préfet of the Seine in 1853, and under his direction Paris was almost rendered a new

city. Among his works were the improvement of the Bois de Boulogne, the prolongation of the Rue de Rivoli, the construction of the boulevard de Sebastopol, and of more than 20 boulevards in the old parts of Paris, various public gardens, squares, barracks, the halles centrales, the new prefectures of police, more than a dozen bridges, and the rebuilding of various mairies, in addition to numerous hospitals, asylums (especially the Hotel Dieu). After several loans had been contracted for the purpose of carrying out these improvements, the municipality of Paris, acting under the powers conferred upon them by special laws, raised a further sum of 250,000,000 francs in 1865, and 260,000,000 in 1869. On the formation of a parliamentary cabinet by M. Emile Olivier, Haussmann was asked to resign his office, and on his refusal was "relieved" by an imperial decree, dated Jan. 5, 1870. He received the decoration of grand officer of the legion of honor, 1856, and grand cross, 1862. In 1857 he was created a senator, and elected a member of the academy of fine arts. He was likewise a member of the imperial council of public instruction. After the fall of the empire he quitted France for a time. On his return he was appointed director of the Crédit Mobilier, and in this capacity he did much to restore the influence and improve the situation of that financial institution. At the election of Oct., 1877, he was returned to the chamber of deputies by the arrondissement of Ajaccio in Corsica, his candidature having received the official approbation of the government.

HAUT'BOIS, or O'BOE, a wind instrument of the "reed" genus. On account of its piercing sound, it was much used in military bands, in the middle of the 17th c., for playing the melody, and from it the whole band used in Germany to be called *Oboisten*. The hautbois, at an early date, took its place as one of the essential instruments of the orchestra. It is made of wood, generally of box, ebony, cocoa, or rosewood, and is constructed in three pieces, or joints, forming a continuous tapering tube, about 21 in. long, the bore of which is narrow at the small end, and widens into a bell-shaped opening, 1½ in. in diameter at the mouth. In the upper and middle piece there are holes, by stopping or opening which with the fingers, the player forms the notes of the natural scale, the intermediate semitones being formed by the keys. The reed is fixed upon the end of a small brass tube which fits, socket-wise, into the small end of the upper piece. The sound of the hautbois is rich; and from its great power in swelling or diminishing the sound, it is capable of every variety of expression. Originally, the hautbois had but two keys, but others have from time to time been added, till the number is now usually fifteen, and sometimes more. Its ordinary scale is that of C natural, but by means of the keys it can be played in every key with facility. Its range of available notes is from B to G in alt. Triebert of Paris is now the most celebrated maker.

Hautbois is also the name given by organ-builders to a reed stop of 8 ft. tone, which is made of metal, similar in shape to the real hautbois, and intended to imitate it in its sound. Its reed is made of thin brass. In all English organs it is an indispensable stop in the swell, where it is most effective. It is only a treble stop, of which the bass is the bassoon. In continental organs it is found of various scales, and when very fine is called the *oboe d'amour*.

HAÜY, RENÉ JUST, a celebrated French mineralogist, was b. at St. Just, in Picardy, Feb. 28, 1743, studied for the church, and took priest's orders. His attention was turned at a comparatively early period of his life to botany, but it was not until he was 38 years of age that, in consequence of accidentally hearing Daubenton lecture on the subject in the jardin des plantes, he commenced the study of mineralogy. Linnæus had already shown that the regular form of crystals is due to the action of forces which obey definite laws, and Romé de Lisle had ascertained that the angles are constant in different crystals of the same variety; but the true laws of crystallization remained unknown until Haüy was led to their discovery by a fortunate accident. See his memoirs on crystallography and mineralogy, amounting to about 100, published between 1782 and 1821. (For their titles and dates, see Poggendorff's *Biog. Liter. Handwörterbuch*, pp. 1038 to 1040). His most important works are his *Traité de Mineralogie* (Paris, 1801, 4 vols. with atlas), of which a second edition appeared in 1822–23; *Traité Elementaire de Physique* (Paris, 1804, 2 vols.), of which a third edition appeared in 1821; *Traité des Charactères Physiques des Pierres Précieuses*, 1817; and *Traité de Crystallographie*, in 2 vols., with a volume of plates, in 1822. He was also a contributor to the *Encyclopédie Méthodique*, and the *Dictionnaire d'Hist. Nat.* Haüy's narrow escape

during the revolution has been already noticed in the memoir of Geoffroy Saint-Hilaire (q.v.). In 1793 he was appointed on the commission of weights and measures; in 1794, conservator of the cabinet des mines; in 1795, teacher of physics at the normal school; and finally, in 1802, he was appointed professor of mineralogy in the museum of natural history and in the faculty of sciences. He was an honorary canon of Nôtre-Dame, and is, in consequence, generally known as the abbé Haüy. He died in 1822, leaving no wealth beyond the collection on which he had based his great discoveries, and which is now preserved in the jardin des plantes.

HAÜY, VALENTIN, 1745–1822; b. France, a brother of René Just, the mineralogist. Valentin devoted great attention to the blind, for whose education he invented ingenious apparatus in the form of raised maps and letters. His first pupil was a blind beggar, who afterward himself became a teacher. In the first year of his school Haüy had 24 pupils. The school attracted general attention and prospered rapidly, many of its pupils becoming proficient in music and mathematics. In 1806 he was called to St. Petersburg by the emperor, and there founded a similar school; and about the same time promoted the establishment of a school in Berlin.

HAVA'NA, or, in English, *the harbor*, by far the most important city in the West Indies, is the capital of Cuba (q.v.). It stands on the n. shore of the island, in lat. 23° 8′ n., and long. 82° 23′ west. Pop. '71, 169,184, according to official return, but really at least 200,000. The climate is tropical, and almost uniform. In summer, the average maximum temperature is 87° F.; in winter, 85° F. The haven is one of the noblest in the world, and its comparatively narrow entrance is secured by six forts. Havana engrosses nearly the whole of the foreign trade of the colony, excepting, perhaps, the illicit importation of Africans, which requires more secluded localities; and it is connected by railroads and telegraph with places in the interior and on the s. coast. In 1877, 1669 vessels, of 835,065 tons, entered the port. Trade and industry have, however, been greatly checked by the insurrection which began in 1868 and lasted for ten years. Most of the mercantile nations have establishments here. Havana is famous for its cigars (164,533,000 cigars, besides 13,895,200 lbs. of tobacco were exported in 1875), and it has manufactures of chocolate, woolen fabrics, and straw-hats. Sugar is the chief export. Havana is a bishop's see, and the seat of government; and, in addition to a handsome display of religious and political establishments, has a university, a botanic garden, several theaters, and one of the most magnificent opera-houses in existence. The streets are in general narrow, but the promenade of *Isabel Segunde*, running through the center of the city, is very fine; it has a broad carriage-way, with shaded walks and several fountains, of which latter there are about 50 in the city.

HAVANA (*ante*). In 1873 the population of Havana had increased to 230,000, doubtless owing to the arrival of soldiers from Spain. A large and constantly growing commerce brings Havana into association with the leading commercial countries, American ships leading in number among the foreign arrivals. The chief manufacturing industry is that of tobacco, of which there was exported in 1878, 13,864,800 lbs., and 174,638,000 of cigars. Another important article of exportation is sugar, which with rum, molasses, fruits, etc., makes up a very valuable trade. Havana is noted for its thoroughfares and public parks—the pasco de Tacon, plaza de Armas, Alameda de Paula, and parque de Isabel—which are unequaled in any other city. The houses are low, with flat roofs, massively constructed, and of the general architecture common to southern Spain. Water is introduced into the city from a distance of 7 m., and there are more than 50 public fountains. Havana is a very unclean and a very noisy city. The sewerage is bad, and the arrangements for street cleaning are not effective. The number of public and private vehicles, apparently in constant use, is so great as to produce a turmoil and confusion which are not paralleled elsewhere. It is said that there are 6,000 victorias and innumerable volantes in the city, besides other vehicles, and the mode of driving is reckless and noisy.

HA'VEL, a river of the n. of Germany, and a considerable tributary of the Elbe, has its origin in a small lake a mile w. of the town of New Strelitz, in Mecklenburg. It flows southward from its source to Potsdam, and thence w. and n.w. to its junction with the Elbe, opposite the town of Werben. Its entire length is 218 m., and it is navigable to Furstenberg, a town within 30 m. of its source. The Havel, which throughout a considerable part of its course serves as the connecting link to a long chain of lakes, is of great importance to the internal trade of Prussia. Of its affluents, the Spree, which is longer than the Havel, is the only one worthy of mention.

HAVELOCK, Major-General Sir HENRY, K.C.B., was b. April 5, 1795, at Bishop-wearmouth, in Durham, where his father was a merchant and ship-builder. He entered the army a month or two after the battle of Waterloo, went to India in 1823, and honorably distinguished himself in the Afghan and Sikh wars. In 1856 he commanded a division of the army that invaded Persia. While absent in that country, news arrived of the Indian mutiny, and he hastened to Calcutta. He was directed to organize a small movable column at Allahabad, and to push on to the relief of the British at Cawnpore and Lucknow. He made a forced march to Futtehpûr, where, at the head of 2,000 men, he engaged and broke the rebels. He continued his march upon Cawnpore, and

twice defeated the enemy—first at Aeng, and then at the bridge over the Pandu Nuddi, 8 m. from Cawnpore. The consequence of the latter victory was the massacre of all the European women and children in the hands of Nana Sahib. Havelock had another battle to fight at Ahirwa, where the rebels were strongly intrenched. He turned their left, and the 78th Highlanders carried the village in a splendid charge. He now entered Cawnpore, and gazed with his men upon the mutilated bodies of the unhappy ladies and children. The sight steeled their hearts, and the avenging column quitted Cawnpore to advance upon Lucknow. Havelock crossed the Ganges, and repulsed the rebels at Unao, and afterwards on the same day at Busserut Gunge. After fighting eight battles with the rebels, in all which he was victorious, his little army found itself so thinned by fatigue and sickness, that he was obliged to retire upon Cawnpore. Early in Sept. gen. Outram arrived with reinforcements, and Havelock again advanced to the relief of Lucknow; Outram, with chivalrous generosity, refusing to take the command out of his hands. The relieving force, which mustered 2,500 men and 17 guns, routed the enemy at Mungalwar. It next engaged them at the Alum Bagh, an isolated building, about 3 m. from the residency of Lucknow. Havelock and his column, with desperate bravery, fought their way through streets of houses, each forming a separate fortress, until they gained the residency, to the indescribable joy of the beleaguered garrison. The victorious army were now in turn besieged, but held their own until Nov., when sir Colin Campbell (now lord Clyde) forced his way to their rescue. After the relief of Lucknow, Havelock was attacked by dysentery, and died Nov. 22, 1857. Before his death, news arrived of his elevation to the distinction of K.C.B. Other honors were in store for him, but they came too late. He was made maj.gen.; appointed to the colonelcy of the 3d foot; and received a baronetcy, with a proposed pension of £1000 a year. The rank and the pension were given to his widow, daughter of Dr. Marshman, an eminent minister among the Baptists. A new patent of baronetcy was issued in favor of the eldest son, Havelock having died the day before the patent was sealed. A metropolitan statue, raised by public subscription, has been erected to his memory in Trafalgar square. Havelock was a strictly religious man and a severe disciplinarian, somewhat after the type of the grave and gallant Puritans who fought and conquered under Cromwell. "For more than forty years," he said to sir James Outram in his last moments, "I have so ruled my life, that when death came, I might face it without fear." His death, at the moment when the rebellion had been crushed, excited the deepest sympathy and regret, not only in the army of India, but also among the public at home.

HAVEMEYER, WILLIAM F., 1804–74; b. New York; graduated at Columbia college, and was for many years a manufacturer of sugars. He was three times elected mayor of the city, and died while in office.

HAVEN, ALICE BRADLEY; 1828–63; b. New York; maiden name Emily Bradley. While at school she sent sketches to the Philadelphia *Saturday Gazette* signed "Alice G. Lee." In 1846 she married the editor of the *Gazette* (Joseph C. Neal), and wrote under the name of "Cousin Alice." After her husband's death, in 1847, she managed the paper for a number of years. In 1853 she was married to Samuel G. Haven. Among her publications are *The Gossips of Rivertown*, and a long list of books for the young such as *Helen Morton; No such Word as Fail; Out of Debt out of Danger*, etc.

HAVEN, ERASTUS OTIS, D.D., LL.D., b. Boston, 1820; graduated at Wesleyan university; was a teacher in Amenia seminary, and became an itinerant Methodist minister, laboring about six years in and near New York. In 1853 he was professor of Greek and Latin in Michigan university; in 1856, editor of *Zion's Herald*, Boston. He was twice in the Massachusetts senate, where he was an earnest advocate of educational interests; he was also a member of the state board of education. In 1863 he was chosen president of Michigan university; in 1869, president of the Northwestern university (Evanston, Ill.); in 1872 corresponding secretary of the Methodist Episcopal board of education; in 1874, chancellor of the university at Syracuse, N. Y. Among his works are *The Young Man Advised; Pillars of Truth, and Rhetoric; a Text book for Schools.*

HAVEN, GILBERT, 1821–80; b. Mass.; graduated at Wesleyan university; taught Greek and Latin in Amenia seminary for two years, and was chosen principal in 1848. In 1851 he joined the New England conference, and preached successively in several large towns. He was chaplain of a Massachusetts regiment in the war of the rebellion. In 1862 he traveled in Europe, and on return was two years a preacher in Boston. In 1867 he was the editor of *Zion's Herald*, holding the place until elected bishop in 1872. For some years he had manifested great interest in the welfare of the colored people, especially those in the southern states where (in Mississippi) he had supervision of relief for destitute freedmen. As bishop of the M. E. church, he was stationed at Atlanta, Geo., with special charge of the interests of the church in the adjoining southern states. He was an earnest advocate of Protestant missions among Italian and Spanish people, and in that interest made a trip to Mexico. Some of his publications are *The Pilgrim's Wallet; National Sermons;* and *Sermons, Speeches, and Letters on Slavery and its War.*

HAVEN, JOSEPH D.D., LL.D., 1816–74; b. Mass.; graduated at Amherst, and studied in Union theological seminary (N. Y.); graduated at Andover in 1839. After officiating

as pastor in Congregational churches in Brookline and Ashland, Mass., he was chosen professor of moral and mental philosophy in Amherst college; afterwards of systematic theology in the Chicago seminary. In 1870 he traveled in Europe and the east. In 1874 he was professor of mental and moral philosophy in Chicago university. He published *Mental Philosophy*, *Moral Philosophy* (text books), and *Studies in Philosophy and Theology*.

HAVENS. See HARBOR.

HAVER, a term used in Scotch law to denote the person in whose custody a document is. It often happens that in the course of a litigation it is essential for the court to see, or for one party to rely, on a document in the hands of a third party. In order to get at the haver or holder, letters of incident diligence are issued, which have the effect of compelling him to produce and exhibit the document, or state on oath why he refuses to do so. The term is not used in England, the same party being merely summoned as a witness by being told in his *subpœna* that he must bring the document with him; or, if there is no trial, he may be examined by commission or under interrogatories.

HAVERFORD COLLEGE, in Delaware co., Penn., was founded in 1832 by orthodox Friends. It was known at first as "Haverford school," but it was made a college, with power to confer degrees, about 1850. It possesses a farm of more than 100 acres of fertile land, and a shaded lawn of 60 acres, beautifully laid out. It has accommodations for only 60 resident students. It is in high repute for thoroughness in whatever it undertakes to teach, and especially for its watchfulness over the morals of its students. Since 1849 it has been open for other than the sons of Friends. Besides the main college building it has a commodious edifice known as "library and alumni hall." The library contains 10,000 volumes. The students are trained with great care and thoroughness, with special reference to the highest moral development. This is the first collegiate institution founded and conducted by Friends alone, and it has done much to raise the standard of intellectual culture among that eminently practical people. It is sectarian only in a very mild way, and has many strong attractions for students of other religious denominations. It has 5 instructors and 60 students. President, Thomas Chase, a graduate of Harvard.

HAVERFORDWEST (Welsh, *Hwlfordd*), a parliamentary and municipal borough, seaport, and market-town of Wales, capital of the co. of Pembroke, and a county of itself, occupies a highly picturesque situation on the sides and at the foot of several steep hills on the West Cleddau river, 8 m. n.e., of Milford, and about 270 m. w.n.w. of London. It is well built, but irregular, and is surrounded by several picturesque walks. When the Flemings settled in the district in the reign of Henry I., Haverfordwest was one of their principal stations. The castle, the keep of which is now used as the county jail, was erected by Gilbert de Clare, first earl of Pembroke, in the 14th century. The nave of St Mary's church—one of the finest in South Wales—is remarkable for the beauty of its roof-carving, and for its skillful construction and rich ornamentation. In conjunction with the boroughs of Fishguard, Narberth, and St Davids', Haverfordwest returns a member to parliament. The trade of the town is inconsidera'ble. Pop. '71, 6,622.

HAVERHILL, a city in Massachusetts, U. S., at the head of navigation of the Merrimack river, on its north bank, 12 m. from its mouth, and 32 m. n. of Boston. It is a pretty town, connected by two bridges with Bradford, and the seat of an active manufacturing industry in boots and shoes (in which 800 persons are engaged), iron, woolens, hats and caps, railway carriages, coaches, soap and candles, tinware, leather. In the colonial times, it was a frontier town, and suffered much from the Indians. Pop. '70, 13,092.

HAVERHILL (*ante*), a handsome city in Essex co., Mass., built on hills sloping down to the Merrimack river. The chief business is shoe manufacturing in which no town exceeds it except Lynn. There are about 7,000 persons engaged in the trade. There are 19 churches, 5 newspapers, a masonic temple, and a public library (20,000 vols.) in a fine building including a hall of statuary. The city hall is also a fine edifice. Haverhill is the birthplace of the poet Whittier. It was settled in 1641. In 1698 the Indians made an assault on the place, capturing Mrs. Hannah Dustan with her child (six days old) and nurse. The child they killed, and after a long march through the woods towards Canada came near one of their villages. They told the women that they would be compelled to run the gauntlet for the amusement of the Indians; but that night Mrs. Dustan, the nurse, and a young English boy (who was also a captive) silently arose, killed ten of the twelve Indians, scalped them, and in a bark canoe went down a river safely reaching home. In 1708 the French and Indians attacked Haverhill and killed or captured 40 persons.

HAVERS, CLOPTON, M.D., an eminent anatomist and physician, who, after studying at Cambridge and Utrecht, where he graduated, settled in London in 1687. His *Osteologia Nova, or Some New Observations of the Bones and the Parts belonging to them* (8vo, Lond. 1691), was long a standard work, and his name is indelibly recorded in the annals of anatomy as the discoverer of the Haversian canals in bone. He edited *The Anatomy of Man and Woman from Spacher and Remmelin* (folio, Lond. 1691), and was

a contributor to the *Philosophical Transactions*. The exact date of his death is not known.

HAV'ERSACK, a bag of strong coarse linen, in which, on a march, each soldier carries his own bread and provisions. It is borne on the left side by a strap passing over the right shoulder, and is only used in the field and in cantonments.

HAVERSIAN CANALS. See BONE.

HAVERSTRAW, a t. in New York, U. S., situated on the w. bank of the Hudson river, 37 m. n. of New York city. Stony Point, famous in the history of the American revolution, lies in this township. Steam-boats and sloops carry on an active trade with New York, and there are several foundries and manufactures. Pop. of township '70, 6,412.

HAVIL'DAR, the highest rank of non-commissioned officer among native troops in India and Ceylon. In the Hong-kong Gun Lascars (a corps now disbanded), the havildar received 1s. 3d. per diem; but in India his pay is somewhat less.

HAVRE, LE (a contraction of the original name, LE HAVRE DE NOTRE DAME DE GRACE), the second town in the department of Seine-Inférieure, France, and next to Marseille, the chief commercial emporium of that country, is situated on the n. side of the estuary of the Seine, in lat. 49° 29′ 16″ n., long. 0° 6′ 37″ e., and 108 m. n.w. of Paris, reckoning in a straight line. Havre has direct communication with Great Britain, Holland, Hamburg, Portugal, Mexico, Brazil, United States, India, etc. It is the port of Paris, with which it is connected by a railway 134 m. long, and the continuation of this line to Strasburg affords such facility of communication with Germany, that the greater part of the trade of that country with America is carried on through Havre. For foreign trade, Havre is the Liverpool of France; it receives annually from 500,000 to 600,000 bales of cotton, nearly three-fourths of the whole quantity imported; it also ships most of the exports to America, and generally speaking, possesses about one-fifth of the whole trade of the country. The sum-total of its imports and exports is about 2,000,000,000 francs (£80,000,000). Customs receipts in 1874, £827,300. The imports consist of cotton, spices, coffee, tea, sugar, timber, coal, etc.; and the exports of French manufactured goods, of wine, brandy, oil, jewelry, provisions, etc. In 1877, 5,925 vessels, of 1,854,202 tons, entered the port—a considerable falling off as compared with previous years. About 500 vessels belong to Havre. Havre also possesses manufactories of paper, sulphuric acid, tobacco, cotton goods, starch, lace, oil, machinery, ropes, salt, etc., also sugar refineries; the annual value of the manufactures being estimated at £2,500,000. Its harbor is one of the most accessible in France, and is entered by a narrow channel formed by two long jetties stretching from e. to w., and which, owing to the current, requires little dredging. This channel leads to the *avant port* (outer harbor), where the various passenger-steamers lie, and within this avant-port are capacious wet docks, capable of accommodating 500 ships. The largest of these is L'Eure, which contains 700,000 square feet. Among the dry docks, one recently completed, 515 feet long and 112 broad, is a stupendous work, and obviates the necessity for sending large steamers for repairs to Southampton. A new basin has been constructed in the plain of the Leure, measuring about 53 acres. Havre was, till lately, surrounded by ramparts and lofty walls; but these were demolished, to admit of the extension of the town, which has now absorbed the neighboring communes of Ingouville and Graville l'Heure, and numbers, '76, 85,407 inhabitants. Among the public buildings may be noticed the churches of Notre Dame and St Francis, the new City hall (built in the style of the Tuileries), the tower of Francis I., exchange, mansion-house, arsenal, barracks, and a number of elegant villas which clothe the slopes of Ingouville. The principal institutions are a royal school of navigation, a school of applied geometry, and a library containing 20,000 vols. The greater part of the town is modern. Havre was founded in 1509 by Louis XII., on the site of a fishing village, and was intended as a harbor of refuge for the French navy. It was greatly extended and improved by his successor, Francis I., and from his time rapidly rose in importance, especially as the rival harbor of Harfleur was being gradually silted up with sand. The names of Richelieu, Colbert, Vauban, Napoleon, etc., are connected with the improvements and additions made to the original harbor. It was bombarded by the British in 1694, 1759, 1794, and 1795. Under Louis XIV., it became the entrepôt and chief seat of operations of the French East India and the Senegal and Guinea Companies. It is celebrated as the birthplace of Mademoiselle Scudery, Bernardin St Pierre (author of *Paul and Virginia*), and Casimir Delavigne. The statues of the last two are placed in front of the library facing the harbor.

HAVRE DE GRACE, a village at the n. extremity of Chesapeake bay, in Harford co., Maryland; on the Philadelphia, Wilmington and Baltimore railroad and at the mouth of Susquehanna river, 36 m. e.n.e. of Baltimore; pop. 3,000. There is a railroad bridge across the river more than 1000 yards long. There are several churches, one newspaper, a high school, and a number of manufactories. The village was burned by the English in the war of 1812.

HAWAI'I. See SANDWICH ISLANDS.

HAWARDEN, a t. in Wales, in Flintshire, 8 m. s.w. of Chester; situated on an eminence commanding an extensive prospect. It lies in the midst of a coal district, and near it are valuable clay-beds. The most important business is the manufacture of coarse earthenware, draining tiles, and fire-clay bricks. The family of Maude derive the title of viscount from the town. Pop. '71 of the township, 6,782; of the parish, (including Saltney), 8,683. In the neighborhood is Hawarden castle, built in 1752, and added to and altered in the Gothic style in 1814; it stands near the ruins of the old castle of that name which was granted by the conqueror to his nephew Hugh Lupus, which after many vicissitudes came into the possession of sergeant Glynne, lord chief-justice of England under Cromwell. On the death in 1784 of sir Stephen R. Glynn, the last of a line of baronets, the castle passed to his brother-in-law, the eminent statesman, Mr. W. E. Gladstone.

HA'WASA, or, more properly, AUSSA, formerly an important, but now a decayed t. of eastern Africa, capital of the country of Adal (q.v.), is situated on the Hawash, in lat. 11° 30′ n., and long. 41° 45′ east. It is still the seat of some traffic, a perpetual fair or market being held here, at which salt, blue calico cloth, and the produce of the soil, are said to be the chief articles of sale. About Hawasa, however, little has yet been ascertained. Pop. estimated at between 5,000 and 6,000.

HA'WASH, a considerable river of Abyssinia, has its origin near the south-western border of the Shoa territory, in lat. about 90° n., and long. about 38° east. It flows in a general n.e. direction, forming throughout three-fourths of its course the southern and eastern boundary of Shoa, and separating that country from the districts inhabited by the Gallas tribes. It then flows through the territories of the Mudaito tribes, and falls into lake Aussa, in lat. 11° 35′ n., and long. 41° 50′ east. The name of the country of Abyssinia (called Habesh by the Arabs) probably originated in that of the river.

HAWES, JOEL, D.D., 1789–1867; b. Mass.; graduated at Brown university, and studied theology at Andover. In 1818 he became pastor of the first Congregational church in Hartford, Conn. Among his published works are: *Lectures to Young Men; Character Everything to the Young; The Religion of the East; Looking-glass for Ladies, or the Formation and Excellence of Female Character,* etc.

HAWFINCH, *Coccothraustes vulgaris,* a bird of the grossbeak (q.v.) genus, and the finch family (*fringillidæ*). It is considerably larger than the chaffinch; the adult male has the crown and back chestnut brown, the neck and rump gray, the wings partly black, the larger wing-coverts white. The Hawfinch is a very shy bird, avoiding man, and therefore often unobserved in districts where it is by no means rare. It is gregarious. It lives chiefly in forests, builds its nest on the highest branches of trees, and feeds very much on beechmast and the kernels of the haw, plum, cherry, etc. It is not uncommon in some parts of England, but is rare in Scotland. It is widely diffused over Europe and the temperate parts of Asia.

HA'WICK, a burgh of barony, and a considerable manufacturing t. in the s. of Scotland, in the co. of Roxburgh, is situated at the confluence of the Teviot and the Slitrig, 10 m. s.w. of Jedburgh, and 53 m. s.e. of Edinburgh by railway. Some of the churches and bank-offices are elegant modern buildings; many elegant mansions and fine villas have sprung up within recent years; and several new streets are models of neatness. The town contains several relics of antiquity worthy of mention. Among these are the Tower inn, part of which was an ancient fortress, and the residence of the barons of Drumlanrig, the superiors of the town; and the Moat, a circular mound, supposed to have been used in remote times both as the place of assembly and deliberation of the neighboring chiefs, and as the seat of the administration of justice. Hawick carries on the manufacture of tweeds (q.v.) on an extensive scale, and has long been known as a principal seat of the hosiery manufacture in Scotland. The tweed-trade has greatly increased in importance of late years, and besides the manufacturers, resident wholesale merchants are largely engaged in it. The stocking manufacture was commenced in 1780. Plaids, shawls, blankets, and leather are also manufactured in the town. About 300 power and 100 hand looms are employed. The exchange is a large and handsome building erected in 1865, in which year the formerly defective water-supply was made excellent by the introduction of the Allen, a mountain burn, which joins the Teviot 5 m. above the town. The ancient municipal constitution of the burgh, founded on a charter granted by James Douglas of Drumlanrig, and confirmed by queen Mary, was reformed by special act of parliament in 1861. The corporation now consists of 15 councilors, elected by £4 householders. The council elect a provost and 4 bailies from their number, as in royal burghs. Hawick now forms one of the 8 border burghs, which together return a member to parliament. Pop. '71, 11,355.

HAWI'ZA, a large and provincial Arab t. of Persia, in the province of Khuzistan, is situated in lat. 31° 15′ n., and long 48° e., 80 m. s.w. of the city of Shuster. Previous to 1835, the river Kerkhah flowed through the town from e. to w.; but a canal having been made to irrigate a tract of the country on the n. side of the river, and whose level was lower than that of the vicinity, the waters of the river burst through the new opening, and are now lost in a marsh, 15 m. n. of Hawiza. The inhabitants of the town can

now obtain water only by digging wells in the old bed of the river. Pop. estimated at 12,000.

HAWK, a term often applied to almost all the *falconidæ*, except the largest eagles, but also used in a more restricted sense to designate a section of the family, reckoned among the *ignoble* birds of prey, having the wings so short as not to extend to the extremity of the tail, and the bill short and curving from the base. In many of their characters and habits, however, they make a very near approach to the true falcons. The species are numerous, are arranged in several genera, and are distributed over the world. Examples of two of the most important genera are the goshawk (q.v.) and sparrowhawk (q.v.) of Britain.

THE HAWK frequently occurs as a charge in heraldry, and may be *belled*, *jessed*, and *varveled*. The *hawk's bell*, itself used as a separate charge, is attached to the leg of the bird by *jesses* or thongs of leather. *Varvels* are rings attached to the end of the jesses. The *hawk's lure*, also a heraldic charge, consists of two wings joined with the line, to the end of which is attached a ring. The line is sometimes *noued* or knotted.

HAWKBIT, the fall dandelion, a perrennial plant of Europe, grown in some parts of the United States. It bears yellow flowers resembling dandelions, and is plentiful from July to Oct. in the eastern states.

HAWKE, EDWARD, Baron, 1705–81; an English admiral. In the naval engagement at Toulon in 1744 he broke from the line of battle in order to engage the *Poder*, and succeeded in compelling her to strike her colors; but his breach of discipline was punished by dismissal from the service. He was, however, restored by the king, and in 1747 was promoted to the rank of rear-admiral of the white. In Oct. of the same year he commanded a squadron sent to intercept a fleet of French merchant vessels bound for the West Indies under a convoy of nine men-of-war, and coming up with them on the 14th near the isle of Aix, he succeeded in capturing six of the men-of-war, but darkness coming on before the close of the contest, all the merchant vessels escaped. For his victory he was created a knight companion of the Bath. In Dec. of the same year he was chosen member of parliament for Bristol. In May, 1748, he became vice-admiral of the blue, and in Jan., 1755, admiral of the white. In 1756 he succeeded admiral Byng as commander of the fleet in the Mediterranean. In 1759 he took charge of a squadron sent to cruise off Brest. On the morning of Nov. 20 he sighted the French fleet under admiral Conflans, off Belleisle, and notwithstanding that the French, trusting to their knowledge of the rocks and shallows, retired towards the shore, he engaged them with such impetuosity that their fleet was only saved from total destruction by the approach of night. As it was, more than half of their vessels were either disabled, captured, or driven on shore. For this brilliant victory, gained with the loss of only two vessels, Hawke received the thanks of the house of commons, and a pension of £2,000 per annum. In 1765 he was appointed vice-admiral of Great Britain, and first lord of the admiralty. In 1776 he was raised to the peerage by the title of baron Hawke of Towton.

HAWKERS, or PEDDLERS, or PETTY CHAPMEN, persons who go from town to town, or door to door, selling goods, wares, or merchandise, or exercising their skill in handicraft. A considerable change has been made by recent legislation in regard to this class. Those peddlers exercising their calling entirely on foot have been separately dealt with from hawkers who employ one or more beasts of burden in their business. The foot peddlers are placed under the surveillance of the police, and are exempt from excise duty. Since Jan. 1, 1872, any person whatever who can satisfy the chief officer of police of the police district in which he resides, that he is of good character, is above seventeen years of age, and has resided during the previous month in the district, will receive, on due application, a certificate valid for a year, on payment of five shillings. Such certificate entitles the holder to exercise his calling in the particular police district only; but should he desire to extend his traffic to another police district, he can, by satisfying the chief officer of that district of his good character, receive an indorsation on his certificate, rendering it valid for that particular district also, on payment of six pence. The police have power at any time to open and search the packs, etc., of any certificated peddler, with a view to prevent dishonesty and smuggling, etc., for which they have much opportunity. They have an appeal to the local justice of peace and other courts against oppression by the police.

Hawkers or peddlers who use beasts of burden are in a different category. Any person may become such by merely taking out an annual or half-yearly license from the excise, and there is no limit of the locality, the license being valid all over the kingdom. These licenses are at the rate of £4 per annum for each beast of burden used in the trade. He is in no case entitled to sell spirits, but he may sell tea and coffee. He must not sell plated goods without taking out a plate license, nor must he sell by auction without an auctioneer's license. Any person hawking unprovided with a license, or who refuses to produce the license to any person who calls for it, is liable to severe penalties. Commercial travelers, book agents, sellers of vegetables, fruit, fish, or victuals, also sellers in fairs or markets legally established, do not require either licenses or certificates, though it must be sometimes difficult to define whether a seller comes within the category of a peddler or hawker (34 and 35 Vict. c. 96; 29 and 30 Vict. c. 64).

The reason why the state imposes this tax on hawkers is, that they have great advantages over regular shopkeepers, as they pay no rent, and often interfere with the natural course of dealing at shops.

HAWKESBURY, a river of New South Wales, in e. Australia, enters the Pacific at Broken bay, about 20 m. to the n. of Sydney. Its entire course does not exceed 50 m., the dividing ridge of mountains being here very near to the coast. Pitt Town, Wilberforce, and Windsor are situated on its banks, and it is navigable from the sea to four m. above the last-mentioned place. The Hawkesbury, even in this land of floods, is remarkable for its inundations. In 1808 the water rose 86 ft.; and in 1844 it rose 20 ft. in a few hours.

HAWKESWORTH, JOHN, 1715–73; b. London. He is said to have been apprenticed at first to a clockmaker and afterwards to an attorney. In 1744 he succeeded Dr. Johnson as compiler of the parliamentary debates for the *Gentleman's Magazine*. Eight years later he started in company with Johnson, Bathurst, and Warton a periodical called the *Adventurer*. This journal had a great success, and ran to 140 numbers, of which 70 were from the pen of Hawkesworth himself. In 1761 he published a volume of fairy tales, and an edition of Swift's works and letters, with a life prefixed which Johnson referred to in highly laudatory terms in his *Lives of the Poets*. He edited the papers of capt. Cook relative to his first voyage, published in 1773 in three volumes, and as a reward of his labors Hawkesworth received from the government the sum of £6,000. His descriptions of the manners and customs of the new world were, however, regarded by many critics as hurtful to the interests of morality, and the severity of their strictures is said to have hastened his death.

HAWKING. See FALCONRY, *ante*.

HAWKINS, a co. in e. Tennessee on the Virginia border, intersected by Holston river, and reached by the East Tennessee and Virginia railroad; 440 sq.m.; pop. '70, 15,837—1889 colored. Clinch mountain and other ridges are prominent features. Chief productions: corn, oats, and butter. Co. seat, Rogersville.

HAWKINS, BENJAMIN WATERHOUSE, b. London 1807; an artist excelling in painting animals. He lived at Knowsley, the seat of the late earl of Derby (at the earl's invitation) where for five years he studied animal portraiture. He was assistant superintendent of the international exhibition of 1851, and in 1852, the crystal palace company employed him to make restorations of extinct animals, in which art he was an expert. In 1868 he lectured in New York and other cities of the United States, and afterwards resided in this country. Here he was employed by the central park commissioners of New York, in restoring the forms of extinct creatures, but later administrations rejected his work, much of which was destroyed. Some specimens, however, exist in the Smithsonian institution collection. He has written *Elements of Form, Comparative View of the Human and Animal Frame, Popular Comparative Anatomy*, etc.

HAWKINS, Sir JOHN, an English navigator, was b. at Plymouth about 1520. He has the infamous distinction of being the first Englishman that trafficked in slaves. His "commercial" career ended in 1568, after which we find him more honorably employed. He was appointed treasurer of the navy in 1573, knighted for his services against the Spanish Armada in 1588, and for the rest of his life was engaged in making havoc of the Spanish West Indian trade. In 1595, along with his kinsman, Drake, he commanded an expedition directed against the Spanish settlements in that part of the world, but died, Nov. 21, in the same year. Hawkins founded a hospital at Chatham for the relief of disabled and sick sailors.

HAWKINS, Sir JOHN, 1719–89; b. England; destined for an architect, but took to the law, devoting his leisure hours to his favorite study of music. A wealthy marriage in 1753 enabled him to indulge his passion for acquiring rare works of music, and he bought the collection formed by Dr. Pepusit, and subsequently presented by Hawkins to the British museum. It was on such materials that Hawkins founded his celebrated work on the *General History of the Science and Practice of Music* (1776), which is less a systematic treatise than a collection of rare and valuable pieces of music with a more or less continuous commentary. He also made occasional contributions to the *Gentleman's Magazine*, edited the *Complete Angler*, and wrote a biography of Dr. Johnson, with whom he was intimately acquainted. He was one of the original members of the Ivy Lane club, and ultimately became one of Dr. Johnson's executors.

HAWK-MOTH, a name sometimes used to comprise all the lepidopterous insects of the section *crepuscularia*, the Linnæan genus *sphinx*. They have a spine or stiff bristle on the anterior edge of each of the hind-wings, and these being received in corresponding hooks on the under-side of the forewings, attach them together. Their wings are generally covered with a looser down than those of butterflies. The body is rather large and thick. Notwithstanding the name *crepuscularia*, signifying that their period of activity is that of twilight, and which is truly characteristic of the greater number, many of them may be seen darting from flower to flower even at mid-day, or hovering over flowers, from which they suck the honey by their long proboscis. They make a loud humming noise with their wings, and are insects of very rapid and powerful flight. Their caterpillars have always 16 feet. A peculiar position which the caterpillars often

assume has led to the name *sphinx*, because of a fancied resemblance to the sculptured monster of Egypt. Their chrysalids are cylindrical, free from points and angular prominences, blunt-headed, with a conical abdomen, and are sometimes inclosed in cocoons, sometimes concealed in the earth.—The name hawk-moth is sometimes limited to a division of the *crepuscularia*, of which the genus *sphinx*, as now restricted, is the type, and of which the death's head moth (q.v.) is an example. Their caterpillars are smooth and elongated. The name hawk-moth appears to be derived from the hovering motions of these insects, resembling those of hawks looking for prey.—Many hawk-moths are natives of Britain; they are more abundant in warmer climates. Some of the species have a wide geographical range.

HAWKS, Francis Lister, D.D., LL.D., American clergyman and author, was b. at Newbern, N. C., June 10, 1798; educated at the university of North Carolina; admitted to the bar in 1817; in 1819, elected to the state legislature; but being drawn to the church, he was ordained, in 1827, a clergyman of the Episcopal church, and was engaged at New Haven, Philadelphia, and St. Thomas's church in New York, until 1843. During this period he was appointed historiographer of the Episcopal church in America, and visited England in search of documents. In 1837 he founded, with Dr. Henry, the *New York Review*, and established St. Thomas's hall, a high school, at Flushing, Long island, which involved him in heavy pecuniary liabilities, charges based upon which were brought against him on his election in 1843 as bishop of Mississippi. He was acquitted of the charges brought against him, but declined the bishopric. In 1844 he became rector of Christ's church, in New Orleans, and president of the university of Louisiana. In 1849 he declined the bishopric of Rhode Island, and became rector of Calvary church, New York. In this busy career he published *Reports of the Supreme Court of North Carolina* (4 vols., 1823–28); *Contributions to the Ecclesiastical History of the United States* (2 vols., 1836–40); *Egypt and its Monuments* (1849); *Auricular Confession in the Protestant Episcopal Church* (1850); a translation of Rovero and Tschudi's *Antiquities of Peru* (1854); and edited the papers of gen. Alexander Hamilton; biographical works; several juvenile books; *Commodore Perry's Expedition to the China Seas and Japan in* 1852–54; and a portion of a *History of North Carolina*. He died in New York, Sept. 27, 1866.

HAWKSBEE, or **HAUKSBEE,** Francis, a natural philosopher of considerable eminence, was b. in the latter half of the 17th c., and died about 1730. He was admitted a fellow of the royal society in 1705, and was appointed to the office of curator of experiments to the society, and in 1723 he was elected assistant-secretary. He contributed 43 memoirs to the *Philosophical Transactions*, chiefly on chemistry and electricity. Of his experiments in the latter department, Dr. Thomson, the historian of the royal society, observes, that "they constitute the beginning of the science, and by drawing the attention of philosophers to that particular subject, were doubtless of considerable service in promoting electrical investigations." All these memoirs appeared between the years 1704 and 1713. His chief independent work was published in 1709, and was entitled *Physico-Mechanical Experiments on various Subjects; touching Light and Electricity producible on the Attrition of Bodies.* He is perhaps best known for his improvement of the earlier air-pumps of Boyle, Papin, and Hooke (a subject fully discussed in Wilson's *Religio Chemici*, pp. 215–218), and for being the first who used glass in the electrical machine.

HAWKSHAW, John, b. England, 1811, and educated there; afterwards turned his attention to engineering. At the age of 20 he was sent out to superintend certain copper mines in South America. He returned to England in 1834, and had charge of important railway and other engineering works; was one of the London commission of sewers, and president of the institution of civil engineers. In 1870 he proposed a submarine tunnel under the straits of Dover. He was knighted in 1873, and president of the British association in 1875. He has published *Reminiscences of South America*, and papers on engineering. Besides his labors in England, Hawkshaw became connected with some of the most important engineering works of Europe, including railroads in Russia, a ship-canal connecting Amsterdam with the North sea, the Madras and Eastern Bengal railway, the government railways in Mauritius, etc.

HAWKWEED, *Hieracium*, a genus of plants of the natural order *compositæ*, sub-order *cichoraceæ*. The species are annual, or more generally perennial plants, some with leafless scapes, one-flowered or many-flowered, and some with leafy stems; the leaves, stems, and involucres in many species being hairy. They are very numerous, natives of the temperate and colder regions of the northern hemisphere, particularly abounding in Europe. A number are natives of Britain, and some of them are very common plants. The flowers are generally yellow, but the orange hawkweed (*H. aurantiacum*), a native of the s. of Europe, and doubtful native of Britain, is often cultivated in gardens for its rich orange flowers. It is a perennial, about 2 ft. high.

HAWLEY, Gideon, 1727–1807; b. Conn.; graduated at Yale, and began missionary work among the Indians at Stockbridge in 1752. Two years later he undertook a mission among the Iroquois on the Susquehanna river, but was driven out in 1756 by the French and Indian war. The latter part of his life was passed in missionary duties in Marshpee, Mass.

HAWLEY, JOSEPH, 1724–88; b. Mass.; graduate at Yale in 1742. He began to preach, but gave up the pulpit for the practice of the law, and became a leading advocate. He was in the house of representatives from 1764 to 1776, and took a prominent position as a friend of freedom from Great Britain. In religious matters he was at first a firm opponent of the theories taught by Jonathan Edwards, but late in life he became their equally firm supporter.

HAWLEY, JOSEPH ROSWELL, b. N. C., 1826, of Connecticut parents, who 11 years after returned to that state. He graduated at Hamilton college, studied law, and began practice in Hartford. In 1857 he became the editor of the *Evening Press*, a newly established republican newspaper. He soon became prominent as a republican writer and speaker. When the rebellion began, he was the first citizen of his state to volunteer on the union side. He entered the service as capt., and was with his company in the battle of Bull Run. He served in various battles, and throughout the war, and was mustered out as brevet-maj.gen. In 1866 he was chosen governor of his state, and when he retired he returned to editorial work on the Hartford *Courant* with which the *Press* had been consolidated. Hawley was president of the republican national convention at Chicago in 1868. In 1872 he was chosen member of congress, and was re-elected in 1873. In 1876 he was president of the centennial commission, and was largely instrumental in elaborating and organizing the system of management of the international exhibition at Philadelphia.

HAWSE, the situation of the cables in front of a ship's bow, when she is moored with two anchors out forward—one on the starboard, the other on the port bow. The term is also used to denote any small distance ahead of a ship, or between her bow and the anchors at which she rides; as, for instance, when it is said of another vessel "she sailed athwart our hawse," or, "she anchors in our hawse." When the two cables pass directly to their anchors, without crossing or chafing at the *hawse-holes* by which they enter the ship, the vessel is said to have a "clean hawse."

HAWSER. See ROPE.

HAWTHORN, *Cratægus oxyacantha* (see CRATÆGUS), a shrub or small tree, a native of Europe, Siberia, and the n. of Africa, common in Britain, and much planted both for hedges and for ornament. It varies in height from 6 or 8 to 20 or 25 feet. It has roundish obovate 3 to 5-lobed deciduous leaves, and corymbs, generally of white, rose-colored, or sometimes deep crimson flowers, succeeded by a small red fruit (*haws*) with yellow pulp, the central stony part bearing a very large proportion to the pulp. The fruit remains on the tree after the leaves have fallen, and affords winter-food to birds. There are many varieties of hawthorn, and, curiously enough, some have only one style, whilst some have several. The variety called GLASTONBURY THORN—because supposed to have originated at Glastonbury abbey—is remarkable for its early flowering, which often takes place in the middle of winter, whilst the common kind is not in flower till May or June. The winter flowers of the Glastonbury variety are, however, not generally followed by fruit, and a second flowering often takes place in the same year. The common hawthorn is often popularly called *May*, from the season of its flowering in England. It is also called *whitethorn*, in contradistinction to the sloe or blackthorn. The use of the hawthorn for hedges is almost universal in Britain. It is also sometimes employed as a stock on which to graft apples and other *pomaceæ*. It attains a great age, and in its more advanced stages, is a tree of slow growth, although, when young, it shoots up rapidly. The wood is very hard, close-grained, and takes a a fine polish, but is apt to warp. A fermented liquor, which is very intoxicating, is made from the fruit in many parts of France.

The hawthorn is particularly valuable as a hedge-plant, in consequence of its strong and plentiful spines, its long life, and its ready adaptation to very various soils. For this purpose, it is propagated by seed; the haws are laid in a heap to rot, with a mixture of sand or fine mold, and in a year or sixteen months after, the seeds are sown in ground carefully prepared by digging and manuring with well rotted manure. The seed-drills are about 16 in. apart. The young plants are kept clear of weeds, and the earth about them occasionally stirred with the hoe. They often grow to the height of a foot or 2 ft. in the first season. They are commonly once transplanted before their final planting to form hedges. See HEDGE. Hawthorn hedges bear trimming very well, and the natural disposition of the plant to spread out above, can be counteracted, so as to make the hedge as it ought to be, widest at bottom; but unless the soil is very favorable, some of the plants are apt to die, and form gaps, which it is by no means easy to fill up with fresh plants.—Young hawthorn plants are called *quicks* or *quicksets*, because used to make living (*quick*) fences.

HAWTHORNE, JULIAN, b. Boston, 1846; son of Nathaniel. He was in Europe from 1853 to 1860. In 1863 he was a pupil in Harvard college, but did not graduate. In 1868 he went to Germany to study engineering, and in 1870–72 he was employed as an engineer by the dock department of New York. In 1872 he made his permanent residence in Dresden, Germany. He has displayed much force and originality as a novelist, publishing *Bressant*, *Idolatry*, *Garth*, and many light sketches.

HAWTHORNE, NATHANIEL, an American author of distinction, was b. at Salem in the state of Massachusetts, on July 4, 1804. He was educated at Bowdoin college, and after graduating there, he obtained a post in the custom-house at Boston, which he soon, however, threw up, and betook himself to literary work for a subsistence. He wrote a number of stories for the journals, which he afterwards collected in 1837, and published under the title of *Twice-told Tales;* a second volume of which appeared in 1851. In 1843 he took up his residence at the charming village of Concord, in a manse which had formerly been the dwelling of Emerson, and which suggested the title of his next work, *Mosses from an Old Manse* (Boston, 1846). This sketch, in which he gives some interesting recollections of his boyhood, first made his name known in Europe. In 1842 he published *The Liberty Tree;* and in 1845, *The Journal of an African Cruiser*. After a three years' residence at Concord, he again accepted a situation in the custom-house at Boston, and removed to that town. This, however, did not stop his literary work. *The Scarlet Letter* appeared in 1851, and was received with universal approbation, as was likewise *The House of the Seven Gables*, published in the same year; and their author was at once recognized, both in Europe and America, as a man possessing a true poetic spirit, combining fine feeling with a charming style, and displaying a deep knowledge of human nature accompanied by genuine humor. His *Blithedale Romance* (Boston, 1852) may be regarded as a kind of autobiography, so far as it goes, being founded on passages in his own life. In 1853 he received the appointment of consul at Liverpool, from his friend, president Pierce, who had been a fellow-student of his, and whose life he had written (*Life of Franklin Pierce*, Boston, 1852). He resided in Liverpool discharging the duties of his office for four years, and afterwards went to Italy to recruit his impaired health; a journey which furnished him with material for his fantastic romance, *Transformation* (London, 1860), which is regarded by some as the best of his works. After his return to America he published *Our Old Home* (1863), a sketch of England and the English. He died suddenly at Plymouth in Massachusetts, May 19, 1864. After his death appeared *Septimius, a Romance of Immortality; American Note-Books; English Note-Books;* and *French and Italian Note-Books* (1872).

HAXO, FRANÇOIS BENOÎT; baron, 1774–1838; b. France; gen. of engineers. He was concerned in a number of sieges, and constructed many important fortifications. The "Haxo casemate" is a work built inside the parapet, arched, and covered with earth, opening in the rear to the terreplain. The guns are protected from the enemy's fire, and can be entirely hidden by masking the embrasures.

HAY (Ger. *heu*, Dutch, *hoy;* probably from the root of Ger. *hauen;* Eng. *hew*, to cut), the stems and leaves of grasses or other plants dried for fodder (q.v.) of cattle. Throughout the grazing and dairy districts of England, and especially in the vicinity of large towns, the hay-harvest is as important as the corn-harvest, and a large breadth of old pasture is annually cut. In Scotland, however, little of this old natural grass is converted into hay, and the crop consists mainly of clover and rye-grass. This requires less turning and labor than the closer succulent natural grass, and with twice turning, and a week or ten days' drying, will generally be fit for the rick, into which the English farmer at once places it. In Scotland the weather is seldom sufficiently fine to fit the hay, within a moderate time, for a large rick, and the practice is to put it, after a few days, in cocks, containing one or two hundredweight, and thence, after another week, into what are technically called tramp-ricks, containing from one to two tons. From these it is transferred at any convenient time to the rick-yard. This practice, although almost universal in the north, is attended with loss of time and labor, and, moreover, bleaches and dries up the hay, giving it the appearance of straw, and preventing that gentle heating which English farmers desire both in their clover and grass hay.

The management of the natural grasses of which most English hay consists is somewhat different, and the process is seen in perfection in Middlesex and various of the counties about London. The great matter—too generally overlooked in Scotland—is to preserve the color and flavor of the grass; and this can only be done by keeping it constantly turned, and having it rapidly dried, if possible, without the deteriorating washing of repeated rains. Artificial drying best attains this end, but is of course impracticable on the large scale. In the best style of English hay-making, the grass, after being cut with the scythe or machine, and as soon as the dew is off, is shaken and spread out by means of forks or of a *tedding*-machine drawn by a horse. It is not allowed to lie long exposed in the sun, but before evening, is drawn together by rakes into *wind-rows*, which, if there is any prospect of rain, are made up into small heaps or cocks. It is again spread out next morning, or on the return of favorable weather; and when the operations are expedited by wind and sun, the hay will be ready for the rick by the second or third day. There is, however, much difference in the time during which the hay requires to lie out; the bulk of the crop and the quality of the land must be especially considered. When the grasses are cut, as they should be when in bloom, and before their seeds ripen and their stems get tough and hard, they contain the largest amount of moisture, and require careful making, but produce then the most nutritive and palatable hay. As soon as it is thoroughly dry, it should be put at once into the stack or rick, and well trodden down. A certain amount of heating improves the flavor, and renders the hay more palatable to every sort of stock. When, as is sometimes the case, it is

imperfectly made, or picked up too soon, it gets overheated, and becomes dark brown or black, its nutritive properties are diminished; it is, moreover, apt to disagree with both horses and cattle, and can only be profitably used when mixed with straw and cut into chaff. Hay put together when damp from rain or dew does not heat, as when it contains an undue amount of natural moisture, but speedily molds. When hay has been weathered and injured by repeated rains, it may be rendered more palatable by scattering a little common salt over the rick whilst it is being built. Throughout Scotland eight or ten pounds of salt to the ton is very generally used alike for the clover and grass hay. In the midland and southern districts of England the best hay is generally got up in June; but in Scotland, little is carried until the middle of July. When the crop is good, and everything done well, the cost of hand and horse labor expended upon the hay before it is safely ricked will approach 20s. per ton. The crop averages from one to two tons per acre. Hay that has stood for seed is tougher and less nutritive than that cut earlier, for the sugar, gum, and gluten of the matured seed have been abstracted from the stems, which are then apt to be little better than straw. For milch cows, well-made English hay is deservedly prized; but good clover-hay is richer in albuminous matters, and better adapted for horses and sheep.

HAY, JOHN; b. Ill., 1839; educated at Brown university; admitted to the Illinois bar, and in 1861 was private secretary to president Lincoln. For a time after the assassination of the president, he served as staff officer in the army. In 1865 he was secretary of the American legation in Paris, and in 1868 in the same position in Madrid. He returned in 1870, and took an editorial position on the *New York Tribune*. He has published *Pike County Ballads* and *Castilian Days*.

HAYBOTE, in English law, is an implied right or liberty of a tenant to take thorns and other wood off the lands he occupies, to repair the hedges, gates, and fences thereof. It also includes wood taken to make rakes and forks for gathering hay, whence the name is derived.

HAYDEN, FERDINAND VANDEVEER; b. Mass., 1829; graduated at Oberlin college; studied medicine in Albany, and took his degree (Albany medical college) in 1853. In that year he commenced the series of scientific explorations which have made his name famous by an examination of the remains of extinct animals found in the "bad lands" of Dakotah. The next three years were passed in a similar exploration of the upper Missouri, resulting in the discovery of an important collection of fossils, which was afterwards divided between the academies of science of St. Louis and Philadelphia. Being appointed geologist of a government expedition to the northwest, he acted in this capacity until the outbreak of the rebellion, when he entered the union army as a surgeon. He rose to be chief medical officer of the army of the Shenandoah. In 1865, and until 1872, he was professor of geology and mineralogy in the university of Pennsylvania, vacating this post on account of his duties in connection with the U. S. geological survey of the territories, which had been placed in his charge in 1867. The reports of the explorations for this survey have been printed by the U. S. government in octavo volumes, and with quarto volumes of illustrations. One important result of these reports was the setting apart by the U. S. government of the lands now forming the National park in the Yellowstone valley, covering a territory more than 3,500 sq. m. in area. Prof. Hayden's work has added to the reputation of this country for scientific exploration.

HAYDN, JOHN MICHAEL; 1737–1806; b. Germany; a brother of the great composer, and himself an organist and composer of merit. He was chapel-master at Salzburg, where he had a school of counterpoint. His works were many, and it is said that his brother thought him the foremost composer of sacred music of his time.

HAYDN, JOSEPH, a German composer, was b. at the village of Rohrau, on the confines of Hungary and Austria, Mar. 31, 1732. He was the son of a poor wheelwright; and manifesting great musical talent, he was received, at the age of eight, into the choir of the cathedral of St. Stephen's, at Vienna. Here he remained till his 16th year, acquiring a practical rather than a theoretical knowledge of his art, by singing the music of the best Italian and German religious composers. In that year, however, his voice broke, and he lost his place as a chorister. He now gave lessons in Vienna, played in the orchestra, occupied himself with composition, and in this manner earned a maintenance. At the same time he studied with extreme care the first six sonatas of Emanuel Bach, which had accidentally fallen into his hands. His position, however, continued very critical, and he was on the verge of starvation, when he had the good fortune to obtain as a pupil a little girl, Signora Martinez, who was being educated at Vienna under the care of the poet Metastasio. Haydn embraced this opportunity of making himself acquainted with the Italian language. Subsequently, Metastasio introduced him to the celebrated singer Porpora, who employed him to accompany him on the piano during his singing lessons, and from whom he obtained the instruction in composition he so anxiously desired and needed. In the latter part of 1750, he composed his first quartet for stringed instruments, and from this period his prospects rapidly brightened. In 1759 a certain count Morzin engaged him as music director and composer, "with a salary of 200 florins, free lodgings, and table with his secretaries

and other officials." About this time, Haydn married the daughter of a hairdresser, who had been kind to him in his days of penury. This marriage did not prove a happy one. "It is nothing to her," said Haydn near the close of his life, "whether her husband be a cobbler or an artist." Her sole ambition was to squander Haydn's earnings. In 1760 prince Esterhazy placed him at the head of his private chapel. For him Haydn composed his beautiful symphonies (a style of composition in which he greatly excelled all his predecessors, and the greater number of his magnificent quartets. While in this situation, his patron conceiving the design of dismissing the band, Haydn composed the famous symphony known as *Haydn's Farewell*, in which one instrument after another becomes mute, and each musician, as soon as he has ceased to play, puts out his light, rolls up his music, and departs with his instrument. It is said that in consequence the prince changed his mind, and did not dismiss the band. After the death of prince Esterhazy, in 1790, Haydn accompanied Salomon the violinist to England, where, in 1791–92, he produced six of his *Twelve Grand Symphonies*. His reception was brilliant in the highest degree. In 1794 he made a second engagement with Salomon for England, and during this period brought out the remaining six symphonies. In England he first obtained that recognition which afterwards fell to his share in his own country. On his return to Austria he purchased a small house with a garden in one of the suburbs of Vienna. Here he composed his oratorios, the *Creation* and the *Seasons*. The former work, the harmonies of which are pervaded with the fire of youth, was written in his sixty-fifth year, and is considered by many to be equal to the finest productions of Handel; the *Seasons* (completed in eleven months) was almost his last work. He died at Vienna, May 31, 1809.

Although Haydn composed slowly and very carefully, his works are exceedingly numerous, comprising 118 symphonies, 83 quartets, 24 trios, 19 operas, 5 oratorios, 163 pieces for the baritone, 24 concertos for different instruments, 15 masses, 10 smaller church-pieces, 44 sonatas for the pianoforte, with and without accompaniments; 12 German and Italian songs, 39 canzenets, 13 hymns in three and four parts, the harmony and accompaniment to 365 old Scottish songs, besides a prodigious number of divertissements and pieces for various instruments.—Compare Griesinger, *Biographische Notizen über Haydn* (Liep. 1810); *Vie de Haydn* (Paris, 1817); Grosser, *Biographische Notizen über Haydn* (Hirschb. 1826); *Pohl, Joseph Haydn* (Part I. 1875).

HAYDON, Benjamin Robert, an English painter, was b. at Plymouth, Jan. 25, 1786. He exhibited his first picture at the academy in 1807, "Joseph and Mary Resting with our Savior after a Day's Journey on the Road to Egypt," which found a purchaser in the author of *Anastasius*. It was succeeded by "Dentatus." Haydon quarreled with the academy about the hanging of this picture, and his life thereafter was divided between painting and controversy. His pictures brought him admiration, and his willful temper procured him foes. As years passed on the admiration cooled, while the foes remained virulent as ever. At this period, he had many patrons, and his pictures brought large prices; his "Judgment of Solomon," for instance, 700 guineas. He made several attempts to be admitted as associate of the academy, and when he was refused he characteristically imputed the refusal to the envy and jealousy of the academicians, and railed against them more bitterly than ever. His great work, "Christ's Entry into Jerusalem," was exhibited by himself in 1820, but did not find a purchaser. Nothing daunted, Haydon painted two other subjects from the passion of the Savior. In 1821 he married, and two years thereafter he produced the "Raising of Lazarus," in some respects the most powerful of his works. This style of subject—covering enormous canvases—not hitting the public taste, he became involved in pecuniary embarrassments, and was finally incarcerated in the king's bench, from which, after a time, he was released through the assistance of his friends. While in prison he painted the "Mock Election," which George IV. purchased for 500 guineas. Of his succeeding works, "Napoleon Musing at St. Helena," excited admiration, and was frequently reproduced. In 1836 he was again imprisoned for debt, and was released on a settlement being effected with his creditors. At this time he forsook the brush for the platform, and his lectures on art brought him fame and money. When government determined to decorate the new houses of parliament with pictures, Haydon engaged in the competition, and was unsuccessful. This defeat he never entirely recovered. He exhibited two of his latest productions in 1846 at the Egyptian hall, but the exhibition was coldly regarded by the public. This was the drop which made the cup overflow. On June 22 he died by his own hand. See his *Life* by Tom Taylor (1852), and his *Correspondence and Table Talk*, by his son (1876).

HAYDUCKS. See Haiducks, *ante*.

HAYEL, or Hail, an Arabian city, capital of the sultanate of Shomer, about 250 m. n.e. of Medina; pop. 12,000. It is a walled town, with towers and gates, and room for 20 times as many inhabitants as it contains. The chief building is the sultan's palace which has a tall oval tower. Hayel is a place of considerable trade.

HAYES, Augustus Allen, American chemist, was b. at Windsor, Vt., Feb. 28, 1806; educated at the military academy in his native town; studied chemistry under prof. Dana of Dartmouth college; and in 1825, distinguished himself by his researches into the proximate elements of American medicinal plants, discovering the organic alkaloid

sanguinaria; and in 1827, investigated the compounds of chromium. In 1828—having removed to Boston—in connection with the growing manufactories of New England, he devoted himself to the chemistry of commerce, of dyeing, and the manufacture of copper and iron. His numerous papers were published in the *Proceedings* of the Boston society of natural history, *American Journal of Science, Annual of Scientific Discovery*, etc. In 1837 his investigations into the generation of steam and economy of fuel, led to the construction of improved furnaces and boilers. He also discovered the process of reducing pig to malleable iron without loss by the use of the oxides of iron; new processes in copper-smelting, the decomposition of alcohol, and formation of chloroform; and the oxidation of alcohol in the human system. As state assayer of Massachusetts, and in the employ of the federal government, he made important investigations into the properties of guano; examined the constitution of sea-water at various depths, and its effects on the copper-sheathing of vessels; and by a series of useful studies and experiments has added to the national wealth and the domain of science.

HAYES, Isaac I., M.D., American explorer, was b. about 1830, educated to the medical profession, and appointed surgeon to the Arctic expedition under Dr. Kane, with which he returned to the United States in 1855, convinced that there existed an open sea around the n. pole, and anxious to head an expedition for its exploration. In this project he was aided by Mr. Henry Grinnell, by the American geographical and statistical society, and by sir R. I. Murchison and the geographical society of London. In June, 1860, he fitted out a schooner of 133 tons, and sailed from New York; July 6, 1860, penetrated to 82° 45′ n. lat., making extensive explorations and observations of the coasts and their inhabitants, and returned to Boston Oct., 1861. In 1867 he published *The Open Polar Sea, a Narrative of a Voyage of Discovery toward the North Pole, in the Schooner United States;* in recognition of which he was awarded a gold medal by the Royal geographical society of London, and a similar honor by the geographical society of Paris. In 1869 Hayes again visited Greenland, and explored the southern coasts of that country.

HAYES, Rutherford Birchard, twentieth president of the United States, was b. at Delaware, Ohio, Oct. 14, 1822. Adopted by a wealthy uncle, he graduated at Kenyon college, Ohio; and having studied law at Harvard, he practiced as a lawyer in Ohio. In the civil war Hayes served with distinction as an officer of volunteers, being once severely wounded, and ultimately rose to be maj.gen. In 1865 he resigned his commission, on being sent by Ohio as representative to congress. Chosen governor of his state in 1867, he was re-elected in 1869 and again in 1875. He was finally selected as the republican candidate at the presidential nomination of 1876. After the election, difficulties as to the reckoning of the votes arose in consequence of the denial by the democrats of the validity of those for Louisiana, Florida, and Oregon. A special electoral commission of fifteen, created for the purpose from amongst senators, representatives, and supreme judges, gave all the disputed votes to Hayes, who accordingly obtained a majority of one over Mr. Tilden, the democratic candidate. Two features in Hayes's policy have been a reform of the civil service—opposed by his own party—and the conciliation of the southern states. The bill for the monetization of silver was carried in 1878 against the president's veto.

HAYES, Rutherford Birchard, LL.D., 19th president of the United States, was b. in Delaware, Ohio, Oct. 4, 1822. Both his paternal and maternal ancestry, it is claimed, can be traced back, each to a Scottish chieftain of noble blood, who fought side by side with Robert Bruce, and he is a descendant in the sixth generation of George Hayes, who left Scotland in 1680 and settled at Windsor, Conn. His grandfather, Rutherford Hayes, born in New Haven, Conn., in 1756, settled in Brattleboro, Vt. Here the father of the president, also named Rutherford, was born. He married Sophia Birchard of Wilmington, Vt., in Sept., 1813, and soon afterwards emigrated to Delaware, Ohio, where he died less than three months before the birth of his now distinguished son. The widow found support in her bachelor brother, Sardis Birchard, who interested himself especially in the welfare of her youngest child. When the boy was 16 years of age his uncle sent him to Kenyon college, where he was graduated at the head of his class in 1842. He chose the profession of a lawyer and began his studies in the office of Thomas Sparrow, esq., of Columbus. Subsequently he spent two years as a student in the law school at Cambridge, Mass. In 1845 he was admitted to the bar at Marietta, Ohio, and soon afterwards entered into practice at Fremont, the residence of his uncle Sardis Birchard, then a wealthy banker. In 1849 he removed to Cincinnati, where he soon gained a remunerative practice. He became a member of the Cincinnati literary club, which embraced among its members Salmon P. Chase, gen. John Pope, gov. Edward F. Noyes, and other scarcely less distinguished men. He became prominent in his profession, important and difficult cases being confided to his care. He married about this time Miss Lucy Ware Webb. In 1856 he was nominated as a candidate for judge of the court of common pleas, but refused to accept the nomination. Two years later he was elected to the office of city solicitor, to fill a vacancy, and was afterwards elected for a full term by the popular vote. In 1861, when the rebellion broke out, his position at the bar was in the first rank, but he resolved to take part in the defense of the country. He enlisted for the whole war and was commissioned as maj. of the 23d

Ohio volunteers, of which W. S. Rosecrans was col. The regiment was assigned the duty at Clarksburg, W. Va., to protect the Baltimore and Ohio railroad and defend the border from raids. Maj. Hayes took a prominent part in various expeditions necessary for the defense of the post. He served for a time as judge-advocate on gen. Rosecrans's staff, discharging his duties with such impartiality as to win universal praise. In the winter of 1861–62 he took a prominent part in various expeditions into the enemy's territory, and on several occasions narrowly escaped death. In Aug., 1862, he was promoted to the colonelcy of the 79th Ohio, but he preferred to remain, with the rank of lieut.col., with the 23d, which had been incorporated with Burnside's command in the army of the Potomac. Lee was now advancing toward Maryland, and the first effort to resist him was at South mountain, where the 23d, led by Hayes, was hotly engaged. More than a hundred of Hayes's men fell dead or wounded under the enemy's fire and his own arm was broken. There was a pause for reinforcements, when a dangerous flank movement of the enemy was discovered, and Hayes, his arm bound up with a handkerchief, was again seen at the head of the regiment. He was finally carried, fainting with loss of blood, from the field. He was laid up with his wounds during the eventful days of Antietam. Upon his recovery he was promoted to the rank of brig.gen. and placed in command of the Kanawha division, of which his old regiment formed a part. He remained at Kanawha Falls until Mar. 15, 1863, when the division was ordered to Charleston, W. Va. After this he led in several important expeditions, notably in that which he himself organized to dispute the retreat of Morgan and his band of guerillas after their raid through Ohio. By a quick movement he cut off Morgan's retreat and forced him to surrender. In the famous raid upon the Virginia and Tennessee railroad, in May, 1864, he led the principal assault upon the enemy's fortifications with admirable boldness and success. He took an honorable part in the attack on Lynchburg, June 18, covering the retreat of the union forces under dangerous conditions with perfect success. In the campaign of the Shenandoah, under Sheridan, his services were conspicuous and valiant. In the battle of Winchester especially, he displayed great coolness and courage in the most trying circumstances, and when Early, a month later, renewed the fight, Hayes's superb coolness in the midst of rout and confusion acted like magic upon his men, and saved Sheridan's train from capture. In this conflict, his horse, while at full speed, fell dead beneath him, throwing him from the saddle and bruising him very badly. It was at this crisis that Sheridan, who had been absent, arrived upon the scene, when the enemy was utterly routed. For his gallant services in the engagements, Hayes was brevetted maj.gen. He was a republican from the moment when the party was formed, and had taken an active part in the political campaign of 1860. His achievements in the war made his name a power in Ohio, and when the republicans of the 2d district felt the need of a popular candidate for congress, he consented to accept the nomination, with the understanding that he would not take the seat unless the war should meantime be ended. His party friends, feeling the need of a strong effort to secure his election, besought him to take part in the canvass. In reply to their entreaties he wrote: "Any man who would leave the army at this time to electioneer for congress ought to be scalped." He was elected by a large majority, but refused to take his seat until, as he said, he could "come by the way of Richmond." When, after the close of the war, he entered congress, he at once drew to himself the attention of the country by his conspicuous ability. He was re-elected in 1866, but had only served through his first term when the republicans of Ohio, in 1867, nominated him as their candidate for governor, under the conviction that he was the only man whom they could hope to elect. He was chosen by a majority of 3,000, and re-elected in 1869 by a majority of 7,518. He was elected for the third time in 1875, and while occupying the place was nominated by the republican party as its candidate for president of the United States. The contest was severe and close, and after the election, disputes arose as to the electoral votes of several states. Great excitement followed, and fears were entertained of a civil commotion before the questions at issue could be settled. At length, however, it was agreed by the representatives of both political parties in congress to refer the questions in dispute to a commission composed of five senators, five representatives, and five judges of the supreme court of the United States, and to abide by its decision. The commission was appointed accordingly, and after hearing the parties upon the questions in dispute, it decided by vote of 8 to 7 (every republican voting with the majority and every democrat with the minority) that the electoral votes of the disputed states (Louisiana, South Carolina, Florida, and Oregon), should of right be given to Hayes; and he was thereby elected by a majority of one. He was inaugurated on Mar. 4, 1877. Aside from partisan disputes upon the questions adjudicated by the electoral commission, and from some of the incidents arising therefrom, his administration of the government is admitted by the best men of all parties to have been pure and honorable. In his letter accepting the republican nomination, he spoke freely of the evils and dangers resulting from the practice of regarding the offices of the national government as the "spoils" of the party in power, to be bestowed upon men as rewards for partisan services, and declared his belief that "the founders of the government meant that the officer should be secure in his tenure as long as his personal character remained untarnished and the performance of his duties satisfactory." He avowed his purpose, if elected, to conduct the administration of the government upon the principle of the

fathers, and pledged himself that "all constitutional powers vested in the executive" should "be employed to establish this reform." As to the relations of the national government to the southern states and their people, concerning which there was at the time the deepest anxiety in all parts of the country, he said: "The moral and material prosperity of the southern states can be most effectually advanced by a hearty and generous recognition of the rights of all by all—a recognition without reserve or exception. With such a recognition fully accorded, it will be practicable to promote, by the influence of all legitimate agencies of the general government, the efforts of the people of those states to obtain for themselves the blessings of honest and capable local government. Let me assure my countrymen of the southern states that if I shall be charged with the duty of organizing an administration, it will be one which will regard and cherish their truest interests—the interests of the white and colored people both, and equally; and which will put forth its best efforts in behalf of a civil policy which will wipe out forever the distinction between north and south in our common country." Mr. Hayes believed that he owed his election to the confidence in him on the part of the electors, which these avowals created, and he felt in honor bound to fulfill his pledges whatever might be the ultimate effect upon his own popularity. Accordingly, in his inaugural address, he said: "I wish now, when every motive for misrepresentation has passed away, to repeat what was said before the election, trusting that my countrymen will candidly weigh and understand it, and that they will feel assured that the sentiments declared in accepting the nomination for the presidency will be the standard of my conduct in the path before me." He declared that while he was "in duty bound and fully determined to protect the rights of all by every constitutional means," he was "sincerely anxious to use every legitimate influence in favor of honest and efficient local self-government, as the true resource of those states for the promotion of the contentment and prosperity of their citizens;" and in his efforts to accomplish this purpose he "asked the cordial co-operation of all who cherished an interest in the welfare of the country, trusting that party ties and the prejudice of race" would "be freely surrendered in behalf of the great purpose to be accomplished." Universal suffrage, he declared, should rest upon universal education, and "to this end liberal and permanent provisions should be made for the support of free schools by the state government, and, if need be, supplemented by legitimate aid from national authority." Acknowledging that he owed his election to the suffrage and zealous labors of a political party, he nevertheless said he should "strive to be always mindful of the fact that he serves his party best who serves the country best." These avowals on the part of the president, though eminently satisfactory to a very large body of citizens, awakened distrust in the minds of many of the leaders of the republican party, and especially among the republican members of congress; and when, not long afterwards, after full inquiry and investigation, he deemed it his duty to withdraw the troops which his predecessor had ordered to be stationed in the state-houses of Louisiana and South Carolina, doing so upon the ground that there did not exist in those states "such domestic violence as is contemplated by the constitution as the ground upon which the military power of the national government may be invoked for the defense of the state," he was denounced by many prominent members of his party as having left the enfranchised negroes of those states without the protection to which they were entitled. But time has abundantly vindicated alike the rightfulness and the wisdom of his action; and there is every reason to believe that if his party had sustained him in the course which he pursued, the best interests of the country would thereby have been promoted. The president was equally unfortunate in failing to enlist the support of his party in his efforts to reform the civil service; but, in spite of the hostility of politicians of all parties, he has been substantially true to his pledges and made the path of reform easier for his successors. Upon all political questions save those above referred to, he has been in harmony with the republican party, and by his courageous and unflinching exercise of the veto power has prevented the adoption of measures calculated to injure the credit of the country and prevent a return to specie payments. He has also, by the interposition of the same power, prevented the repeal of the laws enacted by congress, under the express authority of the constitution, to guard the purity of national elections.

HAYE'SINE, or BORATE OF LIME, known also as BOROCALCITE, HYDROBOROCALCITE, TIZA, etc., remained a mineralogical curiosity until the exhibition of 1851. It is found in some parts of Peru in rounded nodules, rarely larger than a good-sized orange, imbedded in the soil. It is always associated with the nitrate of soda, which is so abundant in that locality. Its chemical composition is $CaO,B_2O_3 + 6H_2O$; or boracic acid, 45.98; lime, 18.45; water, 35.57. It is used as a source of boracic acid in the manufacture of the borate of soda, so extensively employed as a fluxing material for glazing pottery; in glass-making, metallic soldering, etc.: the only other known sources being the boracic acid from the Tuscan springs, and the borax and tincal from Thibet. See BORAX.

HAY FEVER, HAY COLD, or HAY ASTHMA, an affection characterized by a subacute inflammation of the mucous membrane of the nasal passages, the eyes, and the bronchial tubes, with more or less febrile disturbance, headaches, and occasionally asthmatic paroxysms. The name would indicate that the emanations from hay were the sole

cause, but this is not so. The odorant matter of many flowers is as potent a cause, perhaps, as any other. Different persons are no doubt affected by different substances, the more profound cause of the disease being rather the predisposition or idiosyncrasy of the person than the peculiarity of the impinging emanation. The disease appearing only in the summer and autumn, would indicate that the idiosyncrasy requires the stimulus of some peculiar emanations only produced by nature during those seasons; but there is probably a peculiar state of the system which is only developed at those times, and only in certain persons. That the presence of the peculiar matter is as important as the idiosyncrasy is indicated by the fact that the affection soon declines after the appearance of frost. The disease will continue to annoy the patient for several weeks unless he removes to a locality where the external cause does not exist, or succeeds in cutting it short by medical treatment, which, it is held, may sometimes be done. The complaint is rather more prevalent in America than in Europe. It will not be developed at sea, and, it is said, neither in northern Canada or the southern United States. Prof. Morril Wyman, in a work on hay fever (1872), says there are two forms, one called the rose cold or June cold, corresponding to the affection known in England. The other form he calls autumn catarrh. Dr. Wyman states that going to cool mountain regions to any altitude above 800 ft. above the sea level, will give relief. Iodide of potassium, iodide of bromine, and strychnia are said to be useful as medicines, but it would be preferable to limit the treatment to removal to some locality where the disease is not developed. Prof. Helmholtz discovered minute vibrios in the mucous secretions of the air passages, upon the presence of which, it has been thought by some, the disease probably depends. The motions of these organisms have been arrested by quinine, and this drug has been suggested as a remedy, but no definite results have been obtained, and it is probably better, as above stated, to depend upon hygienic measures, including removal.

HAYNAU, Julius Jakob, Baron von, an Austrian gen., was b. in 1786, entered the Austrian service in 1801, and gradually advanced in rank, till in 1844 he was appointed field-marshal. During the Italian campaigns of 1848–49; he signalized himself by his ruthless rigor, especially at the capture of Brescia. Haynau was engaged in the siege of Venice, when he was summoned by the emperor to Hungary, in May, 1849, to take the supreme command of the forces in that country. The storming of Raab, the advance southward, the occupation of Szegedin, and the engagements on the Theiss, were all the work of Haynau. But his atrocious severity towards the defeated Hungarians, and especially his alleged flogging of women (a charge denied by Haynau), excited the hatred and detestation of Europe. In 1850 he was dismissed from public service, not for his cruelty, however, but for the intractability of his disposition. In the same year he was brought into unenviable notoriety on the occasion of his visit to the brewery of Messrs. Barclay and Perkins during his stay in London, when he was assaulted by the draymen, and barely escaped with life. For this insult the British government declined giving any satisfaction. On subsequently visiting Belgium and France, he was received by the populace with strong dislike; but by the vigilance of the authorities was preserved from actual insult. Baron Schönhals, in a biography of his friend Haynau (Grätz, 1853), tries to exonerate him from the accusation of being either constitutionally or intentionally cruel, and asserts that he only acted in obedience to the orders of his masters. Haynau died at Vienna, Mar. 14, 1853.

HAYNE, Isaac, 1745–81; b. S. C. In 1780 he was a member of the state legislature. He was taken prisoner at the capture of Charleston, and required not to bear arms against the English, agreeing to which he was permitted to visit his family, then sick with small-pox. After Greene's successes, when the British held only Charleston, Hayne was required to take up arms for the king, but he fled to the American camp. He was made a col., but not long afterwards was captured and hung by order of lord Rawdon.

HAYNE, Paul Hamilton, b. S. C., 1830; educated at Charleston, and was connected as writer or editor with various periodicals there, the *Evening News*, the *Literary Gazette*, and *Russell's Magazine*. In 1854 he published a volume of poems, of which the *Temptation of Venus* is the most noteworthy; a second volume of his poems appeared in 1857, and a third, called *Avolio*, in 1859. *The Mountain of the Lovers, and other Poems*, and *Legends and Lyrics*, appeared in 1873, and the same year Mr. Hayne edited for publication the works of another southern poet, Henry Timrod. A complete revised edition of Mr. Hayne's work is now (1881) in press.

HAYNE, Robert Young, 1791–1840; b. S. C.; educated in Charleston, and at the age of 21 admitted to the bar. He was a member of the legislature, speaker of the house, state attorney-general, and in 1823 a senator in congress. Here his enunciation of the doctrine that any state has the right to disobey and suspend such federal laws as its people might deem injurious to their interests, brought on the famous discussion between himself and Daniel Webster. The provocation was the tariff of 1824, which was strenuously opposed in South Carolina, and a state convention (Nov. 24, 1832) adopted an ordinance of nullification. As soon as the fact was known at Washington,

president Jackson issued the famous proclamation in which he declared in substance, that nullification was treason, and that the union must and should be preserved. Hayne was then governor, and replied in a proclamation of defiance, and the state prepared to resist the enforcement of the tariff laws by arms. There was no collision, however, as congress speedily modified the tariff, and the state repealed the nullification ordinance. In 1834 Hayne was chosen mayor of Charleston.

HAYNES, JOHN, d. 1654; b. England; came to Boston in 1633, and two years later was chosen governor of Massachusetts colony. In 1639 he was the first governor of Connecticut, and was re-elected every other year (as often as the law allowed) until his death. He was one of the five who prepared a written constitution for the colony, the first organic law drafted in the country, and said to embrace many of the cardinal principles of subsequent constitutions, federal and state.

HAYNES, LEMUEL, 1753–1834; a mulatto, b. Conn.; abandoned by his white mother and brought up as a servant, but educated as one of the children of a New England family. He volunteered in the revolutionary army, and was in the Ticonderoga expedition. In 1780 he worked at farming, and by firelight studied Greek and Latin and theology. In 1785 he was ordained, and was soon after settled at Rutland, Vt., where he labored 30 years. He afterwards preached in Manchester, Vt., and Granville, N. Y.

HAYS, a co. in s.w. Texas, on San Marcos river; 650 sq.m.; pop. '70, 4,088—1217 colored. Surface hilly; chief productions: corn and cotton. Co. seat, San Marcos.

HAYS, ISAAC, 1796–1879; b. Philadelphia; an American physician and scientist, graduated in 1816 of the department of arts, and in 1820 of that of medicine, in the Pennsylvania university. He edited two successive editions of Wilson's *American Ornithology*, besides several important medical and scientific works. He was sole editor from 1827 to 1869 of the *American Journal of the Medical Sciences*. He was president of the academy of natural sciences in Philadelphia from 1865 to 1869, and an active member of the philosophical society; also one of the founders of the Franklin institute, its secretary for several years, and at the time of his death its oldest member. He was one of the oldest members and for a time an officer of the college of physicians of Philadelphia; also one of the founders of the American medical association, and author of its code of ethics, which has been adopted by all the medical societies in the country.

HAYS, WILLIAM JACOB, 1830–75; a painter, who devoted his life chiefly to the painting of animals, in furtherance of which purpose he visited the upper waters of the Missouri, various northern states, and Nova Scotia. Some of his pictures are "The Herd in the Moor" (a herd of buffaloes); "The Prairie-Dog Village;" "A Bison Bull at Bay;" "Prairie on Fire;" and "Herd of Caribou in Nova Scotia." His latest work was in illustrating "The Ruminants of America."

HAYTI, otherwise known as HISPANIOLA or ST. DOMINGO, is, after Cuba, the largest of the West Indian islands, now divided into the independent states of Hayti, and the Dominican republic (q.v.). It is nearly equidistant from Porto Rico on the e., and from Cuba and Jamaica on the w., with the Caribbean sea on the s., and with the Bahamas and the open ocean on the n. Hayti lies in n. lat. between 17° 37′ and 20°, and in w. long. between 68° 20′ and 74° 28′. It belongs to the group of the Greater Antilles, and, like all the principal members of its series, its greatest length (about 400 m.) is in the direction—from w. to e.—of the chain of which it forms a part; its greatest breadth is 160 m. Area, including the islands of Tortuga, Gonaive, etc., about 28,000 sq.m., and the pop. about 760,000. The country, as the native name implies, is mountainous, being traversed longitudinally by a ridge, which sends out lateral spurs, terminating in headlands on either coast. The range is of volcanic origin—a fact still corroborated by the frequent occurrence of terrible earthquakes. Cibao, believed to be the loftiest summit, is said to be about 7,000 ft. above the level of the sea. The mountains, richly and heavily timbered, are understood to be susceptible of cultivation almost to their tops. With such a soil well watered, and with a climate tempered by the sea-breezes, Hayti, as a whole, is perphaps the most fertile spot in the West Indies; while its excellent harbors, more especially those in the bay of Gonaives on the w., offer considerable facilities to foreign trade—hurricanes, however, prevailing in Aug. and Sept. The rivers are inconsiderable, and useless for navigation. Besides several bodies of fresh water, the salt lake of Henriquillo, near the s. shore, claims particular notice, as indicating by its tidal action some subterranean communication with the Caribbean sea. The productions are coffee, logwood, mahogany, tobacco, cotton, cocoa, wax, ginger, and sugar; and mines of gold, silver, copper, tin, and iron, though not now worked, are found in many places.

Within little more than an age after 1492, the aborigines had been swept away by the remorseless cruelties of the Spaniards. In connection with this deplorable result, Hayti, already the seat of the first white settlement in America, became one of the earliest fields, in the western hemisphere, of negro servitude. Next came the bucaneers, during the 17th c., to avenge the red man's wrongs! and as those marauders were chiefly French, the western portion of the island, which was their favorite haunt, was, in 1697, ceded to France by the peace of Ryswick, thus presenting the first important break in

the unity of Spanish America. For nearly 100 years, the intruders imported vast reinforcements of Africans; while the mulattoes, who were a natural incident of the concomitant license, rapidly grew, both socially and politically, into an intermediate caste, being at once uniformly excluded from citizenship, and generally exempted from bondage. In 1791, under the influence of the French revolution, the mutual antipathies of the three classes—white, black, and mixed—burst forth into what may well be characterized as the most vindictive struggle on record—a struggle which, before the close of the 18th c., led to the extermination of the once dominant Europeans, and the independence of the colored insurgents. Thus, as the emancipated bondmen mostly belonged, at least in form to the Church of Rome, Hayti now exhibited the only Christian community of negro blood on either side of the Atlantic. In 1801 France sent out a powerful armament to recover her revolted dependency, treacherously seizing and deporting the deliverer of his brethren, Toussaint l'Ouverture. In 1803, however, she was constrained to relinquish her attempt; and in 1804, Dessalines (q. v.), aping the example of Napoleon, proclaimed himself Emperor of Hayti; thus reviving the indigenous name of the island, which had been in disuse for upwards of 300 years.

This great change was fatal to the commercial prosperity of French Hayti, decidedly the more valuable section of the island. In its progress, it had destroyed capital in every shape; and in its issue, it could not fail to paralyze labor under circumstances where continuous exertion of any kind was equally irksome and superfluous. Nor was the political experience of the lately servile population more satisfactory than its economical condition. Sometimes consolidated into one state, and sometimes divided into two, the country alternated, through the instrumentality of one revolution after another, between despotism and anarchy, between monarchy and republicanism, between a kingdom and an empire. Its only tranquil period of any duration coincided with the rule of president Boyer, which subsisted from 1820 to 1843—its last 21 years comprising not only the whole of French or western Hayti, but likewise the Spanish or eastern portion of the island. Hayti thus united, besides being immediately recognized by the European powers in general, was soon acknowledged even by France, on condition of paying 150,000,000f., or £6,000,000 sterling, as a compensation to the former planters.

About the year 1843 the inhabitants of the eastern or Spanish portion of Hayti, rising against their Haytian oppressors, formed themselves into a republic called the Dominican republic (q.v.), and in May, 1861, threw itself under the protection of Spain, a connection which was dissolved in 1865. The western portion of the island had been republican in its form of government previous to 1849, when its former president, gen. Soulouque, ascended the throne, proclaimed an empire, and assumed the title of emperor Faustin I. In 1859, however, a republic (*république de Haïti*) was again proclaimed and a new constitution adopted. The eastern, once Spanish, portion still exists as a separate republic, the *república Dominica*. Of the former the area is upwards of 10,000 sq.m., and the pop. 572,000; the latter has an area of over 18,000 sq.m., but the pop. does not exceed 250,000. The joint exports of the two republics to Great Britain in 1877 were valued at £247,300; their imports thence at £383,200. Coffee, logwood, cotton, cocoa, and wax are the chief exports. Port-au-Prince, the chief commercial city of the island, is the capital of the western republic.

HAYWARD, the name given in England to one who keeps the common herd of cattle of a town, or of a manor, when the copyhold or other tenants have the right of sending cattle to graze. In Scotland, the corresponding term is "shepherd" in rural burghs.

HAYWOOD, a co. in w. North Carolina on Big Pigeon river; 700 sq.m.; pop. '70, 7,921—515 colored. It is in a rough region between Iron mountain and the Blue ridge, but the valleys are fertile; productions: corn, tobacco, butter, wool, &c. Co. seat, Waynesville.

HAYWOOD, a co. in w. Tennessee on Hatchee river, traversed by the Memphis and Louisville railroad; 500 sq.m.; pop. '70, 25,094—13,832 colored; in '80, 23,397. It is level, with considerable forest land. The soil is fertile; chief productions: cotton, corn, and pork. Co. seat, Brownsville.

HAZÁRA, or HUZARA, a British district in the Punjab, India, 2,771 sq.m.; pop. '68, 267,218. The district forms a wedge of territory extending far into the heart of the outer Himalayan range, and consisting of a long narrow valley, shut in on both sides by lofty mountains, whose peaks rise to a height of 17,000 ft. above sea level. Towards the center of the district the vale of Khagan is bounded by mountain chains, which sweep southward, still maintaining a general parallel direction, and send off spurs on every side which divide the country into numerous minor dales. The district is well watered by the tributaries of the Indus, the Kunhar, which flows through the Khagan valley into the Jhilam (Jhelum), and many rivulets. Throughout, the scenery is picturesque. To the north rise the distant peaks of the snow-clad ranges; midway, the mountains stand clothed to their rounded summits with pines and other forest trees, while grass and brushwood spread a green cloak over the nearer hills, and cultivation covers every available slope.

HAZARD, a game at dice without tables, which can be played by any number of persons. One person, called the *caster* (his opponent who bets with him being called the

setter), takes the box and dice, and makes a throw (called a *main*), which must be above 4, and not exceeding 9; and if the first throw made is not within these limits, the caster must throw until such a one occurs. After the caster has thrown the main, he throws his own chance. The throws, 2, 3, 11, 12, are called *crabs*, and are losing throws for the caster, except in the following cases, viz., 12 when 6 is the main, 11 when 7 is the main, or 12 when 8 is the main; in these cases, and also when the caster's throw is the same as the main, the throw is called a *nick*, and the caster wins. If his throw be not a nick, or a crab, then, if he can repeat the same throw before the main turns up, he wins. If the caster throws crabs, not nicks, or if he fails to repeat his throw before the main turns up, the setter wins the stakes. The setter, on the whole, has slightly the advantage of the caster, especially if 6 or 8 be the main, when his chance is to the caster's in the proportion of 7,295 to 6,961, or 22 to 21 nearly. Hazard is exclusively a game of calculation, and is never played merely with a view to amusement. Essentially an essay of calculations and combinations, requiring a cool and clear head to execute them, it has been an incitement to the wildest schemes under the name of "systems" that ever laughed mathematics to scorn. Hazard has been long a standing game at all the houses of play in Britain, in the face of a fact, that owing to the intricacy of the calculations of probabilities, the odds in favor of the professional player over the amateur are 100 per cent. "In spirit, if not to the letter, it is the arithmetic of dice."

HAZARD, ROWLAND GIBSON, b. R. I. 1801; a member of the state legislature, but more widely known for his connection with mercantile and manufacturing interests, to which he had added authorship. Among his publications are *Essay on Languages*, *Lectures on the Adaptation of the University to the Cultivation of Mind*, *Lecture on Causes of the Decline of Political and National Morality*, *Causation and Freedom of Willing*, etc.

HAZARIBAGH', the capital of the district of the same name, province of Chota Nagpore, presidency of Bengal, is situated 239 m. to the n.w. of Calcutta, and 189 to the s.e. of Benares, in lat. 24° n., and long. 85° 24' e. Pop. '71, 11,050. On the conquest of Sinde, Hazaribagh was selected as the residence of the dethroned Amirs.

HAZEBROUCK', a small but flourishing t. of France, in the department of Nord, at the junction of the Calais and Dunkerque railways, 25 m. w.n.w. of Lille. The parish church, built 1493–1520, is surmounted by a spire of open work, 240 ft. high. Manufactures of linen-cloth and twist, soap, leather, refined salt, beer, oil, and lime, are carried on. A great linen market is held here every Saturday. Pop. '76, 6,363.

HAZEL, *Corylus*, a genus of trees and shrubs of the natural order *cupulifera*, of which the fruit is a nut in a leafy and laciniated cup, the enlarged involucre of the female flower. The male flowers are in cylindrical catkins; the female flowers appear as mere clusters of colored styles at the extremities of buds; the male flowers are pretty conspicuous, the female flowers are very small.—The COMMON HAZEL (*C. avellana*) is a large shrub or low tree, with a bell-shaped fruit-cap, which is somewhat two-leaved, open, and spreading. It is a native of Britain, and of all the temperate parts of Europe and Asia; it is common also in North America. Hazel nuts of improved varieties are grown to a considerable extent in the south of England, particularly in Kent; they are also imported in large quantities from the south of Europe. Hazel nuts yield, on pressure, about half their weight of a bland fixed oil, often call *nut-oil* in Britain, the hazel-nut being popularly known by the term *nut* alone; but in Germany it is walnut-oil which is usually called nut-oil. Hazel-nut-oil has drying properties, and is much used by painters; it is also used by perfumers as a basis with which to mix expensive fragrant oils; and it has been employed medicinally in coughs. The wood of the hazel, although seldom large enough for the purposes of the carpenter, is very tough and flexible, and hazel-rods are therefore much used for making crates, hurdles, hoops for small barrels, etc. The thicker stems of hazel are used for making charcoal, which is in great request for forges, is much esteemed for the manufacture of gunpowder, and is the kind preferred by artists for crayons.

The value of the hazel-nuts annually imported into Britain is about £100,000. The quantity used for making oil is comparatively inconsiderable.

Most of the cultivated varieties of the hazel-nut are known by the names of *cob-nuts* and *filberts;* the former generally of a roundish form; the latter characterized by the greater elongation and laciniation of the fruit-cup; the name filbert being indeed regarded as a corruption of full-beard. The Red filbert, or Lambert's nut, is remarkable for having the pellicle which surrounds the kernel of a crimson-red color. The finer kinds of hazel are propagated by grafting and by layers. Hazel-plants for copses are obtained from seed.—The BEAKED HAZEL (*C. rostrata*), a species having a very hairy fruit-cup prolonged into a long beak, is a native of the northern parts of America. Its kernel is sweet.—The CONSTANTINOPLE HAZEL (*C. colurna*), the nuts of which are considerably larger than those of the common hazel, is a native of the Levant, from which the fruit is imported into Britain. It is much used for expressing oil, but is a less pleasant fruit than many kinds of cob-nut and filbert. A Himalayan species of Hazel (*C. ferox*) has a spiny fruit-cup, and an excessively hardnut. *Barcelona nuts* are the nuts of a variety of the common hazel, kiln-dried before their exportation from Spain. Hazel-nuts not subjected to this process cannot be kept long without losing in

part their agreeable flavor, and contracting a sensible rancidity, except in air-tight vessels, in which they are said to remain fresh even for years.

The larva of a weevil (*balaninus nucum*) feeds on the kernels of hazel-nuts. The parent female makes a hole into the nut by means of her long snout and there deposits an egg. Great numbers of nuts are thus destroyed.

HAZEN, WILLIAM B., b. Vt. 1830; graduated at West Point 1855; served on the frontier and in the war of the rebellion, being engaged in many skirmishes and battles. He became maj.gen. of volunteers, and after the war was made col. of infantry in the regular army. During the Franco-German war he was employed in studying the education and characteristics of French and German soldiers, and on his return home, wrote a work entitled *School and Army of France and Germany*. In 1877 he was appointed military attaché to the United States legation at Vienna, and in 1880, chief signal officer of the army.

HAZLETON, a t. in Luzerne co., Penn., in the midst of the coal region on the ridge between the Susquehanna and the Delaware rivers, reached by the Lehigh Valley, and by the Danville, Hazleton and Wilkesbarre railroads; pop. of township, 7,500. The coal trade is the chief business, about 1,000,000 tons being mined in this district every year. In the town are nine churches, a Roman Catholic academy and convent, a town hall, and several manufactories.

HAZLITT, WILLIAM, a distinguished English essayist and miscellaneous writer, the son of a Unitarian clergyman, was b. at Maidstone, in Kent, on April 10, 1778. His father went to America with his family when Hazlitt was about five years of age, but returned in two years, and became pastor of a congregation at Wem, in Shropshire. In 1793 Hazlitt became a student in the Unitarian college at Hackney, but did not take kindly to theological pursuits. In 1795 he left college, and returned to his father's house, where he devoted himself to metaphysics and painting; about this time he met Coleridge, and by the conversation of the poet was awakened to a keener intellectual life than he had before known. In 1802 he visited Paris, and studied in the Louvre, and on his return he attempted to support himself by portrait painting; but, as he could neither please himself nor his patrons, he relinquished the easel, and threw himself into literature, for which he was much better adapted. In 1803 he went to London, and shortly after published his essay *On the Principles of Human Action*. In 1808 he married, and retired into the country. In 1811 he was again in London. In 1813 he delivered a course of lectures on the history of English philosophy, and he subsequently delivered courses on the English poets. He wrote essays in the *Examiner* in conjunction with Mr. Leigh Hunt, which were afterwards republished in a volume entitled the *Round Table*. Other essays he collected into volumes, entitled *Table Talk* and the *Plain Speaker*. He also published *Characters of Shakespeare's Plays* and the *Spirit of the Age*. In 1822 he was divorced from his wife, and two years afterwards married a second time. He died Sept. 18, 1830. His last work was the *Life of Napoleon*, of whom he was an enthusiastic admirer. An edition of his principal works was edited by his son; and *Memoirs of William Hazlitt* were published by his grandson in 1867.

The fame of Hazlitt rests upon his essays, which are in every sense remarkable. He exhibits great acuteness and penetration in his criticism, and every now and again a passage, by reason of passionate force and *abandon*, rises into the regions of poetry. On the whole, his essays are inferior to Lamb's and Hunt's, but they contain pages quite as striking and memorable as any to be found in theirs.

HAZLITT, WILLIAM, b. England 1811; son of the essayist; a lawyer and registrar of bankruptcy in London in 1854. He has edited the writings of his father, and made translations of some of the works of Guizot, Thierry, Huc, and others. He has also re-edited *Johnson's Lives of the Poets*, and assisted in compiling a *Manual of Maritime Warfare*.

HAZLITT, WILLIAM CAREW, b. England 1834; grandson of the essayist, and a member of the English bar. He has published *History of the Venetian Republic*, *Sophie Laurie* (a novel), and *Memoirs of William Hazlitt;* and has collected and edited various works on old English poetry, proverbs, antiquities, etc.

HEAD. See BRAIN, CONCUSSION, SKULL, CAROTID ARTERIES, etc.

HEAD, Sir EDMUND WALKER, bart., for some years governor-general of Canada, was b. in 1805, near Maidstone, Kent; educated at Oriel college, Oxford, where he was first-class in classics in 1827, and became fellow of Merton; succeeded his father, the seventh baronet, in 1838; was appointed assistant poor-law commissioner, and in 1841 became poor-law commissioner. After the breaking up of the poor-law board, he was, in 1847, nominated lieut.gov. of New Brunswick. He held this post until Sept. 1854, when he succeeded the earl of Elgin as governor-general of Canada. He was the author of *The Handbook of Spanish Painting*, a *Tour in the Manufacturing Districts*, etc. Head was made a privy councilor in 1857, and K.C.B. (civil) in 1860. He resigned his post in 1861, and died in 1868.

HEAD, Sir FRANCIS BOND, bart., an author, and ex-governor of Upper Canada, was b. at Hermitage, near Rochester, in 1793. He entered the corps of royal engineers, and

had attained the rank of capt. when, in 1825, he accepted an engagement from a private company to work some gold and silver mines on the river Plate. He crossed the Pampas from Buenos Ayres to Chili, and on his return to London, published his *Rough Notes of a Journey across the Pampas*. He was made a maj. in the army in 1828; and in 1835, while holding the post of assistant-commissary of the army, on the urgent request of lord Glenelg, then colonial secretary, he accepted the govenorship of Upper Canada. He declared, in pursuance of his instructions, that an elective legislative council could not be granted, and that the crown reserves would not be abandoned, except on condition of an adequate and permanent civil list being voted. The house of assembly stopped the supplies, as a means of obtaining redress for the alleged grievances of the province. Head thereupon dissolved the house, and the result of the dissolution was in his favor. An insurrection, which had its origin, as it was said, in his injudicious measures, broke out. He had, with well-founded confidence in his own resources, sent away from Upper Canada the whole of the queen's army; and putting himself at the head of the militia, he succeeded in suppressing the insurrection. In 1838 he resigned his post, and was created a baronet. He published a *Narrative*, in answer to some severe strictures and imputations of rashness and want of judgment, to which his Canadian administration had given rise. After his retirement he devoted himself to literary pursuits. He made frequent appeals on the defenseless state of the country; he also wrote *Bubbles from the Brunnens of Nassau; A Fagot of French Sticks; A Visit to Ireland; The Emigrant; Life of Bruce the Traveler*, etc.; he was also a frequent contributor to the *Quarterly Review*, some of his articles in which were reprinted. He died at Croydon on July 20, 1875.

HEAD, Sir GEORGE, 1782–1855; b. England. In 1808 he was appointed to the commissariat of the British army in the peninsula, where he was a witness of many exciting scenes and important battles, of which he gave an interesting account in *Memoirs of an Assistant-Commissary General* attached to the second volume of his *Home Tour* published in 1837. In 1814 he was sent to America to take charge of the commissariat in a naval establishment on the Canadian lakes, and he subsequently held appointments at Halifax, and Nova Scotia. Some of his Canadian experiences were narrated by him in *Forest Scenery and Incidents in the wilds of North America*. In 1831 he received the honor of knighthood. He published *A Home Tour through the Manufacturing Districts of England*, and in 1837 a sequel to it entitled, *A Home Tour through various parts of the United Kingdom*. He also published *Rome, a Tour of Many Days*, and several articles in the *Quarterly Review*, and translated *Historical Memoirs of Cardinal Pacca* 1850, and the metamorphoses of Apuleius.

HEADACHE, a pain referred to the front, side, or back of the head, varying in intensity and other characters according to its cause and pathological relations. The most common varieties of headache are those which are dependent on, or connected with, derangements of the digestion, and frequently occur after meals. Such headaches are common among young persons, and especially young women leading lives of unnatural confinement within doors amid vitiated air. The subjects of this form of headache are usually pale and feeble, or delicate and easily flushed; they are often addicted either to sedentary occupations, or to balls, theaters, evening concerts, and other dissipations extending far into the night. The cure is so evident that it need not be insisted on as a matter of doctrine, but the practical application of the lesson is often difficult, owing to the blind devotion with which pleasure is often followed to the obvious detriment of health. Very different is the form of headache caused in older persons, and mostly in men, by a "flow of blood to the head," in connection with threatened apoplexy. In this case the habit is usually full, the complexion florid; giddiness is apt to come on in stooping, and the pain and sense of fullness and throbbing characteristic of the complaint, increase; in some cases, there is an approach to insensibility or double vision, as an additional warning. In these cases, gentle purgation and restricted diet, with exercise, will usually bring about a cure, unless there is positive organic disease. The periodic headache, or *megrim* (Fr. *migraine*, from Gr. and Lat. *hemicrania*, i.e., half the head), otherwise called *brow ague*, is a curious variety which is closely connected with malaria (see AGUE), and recurs at more or less regular intervals, affecting exactly half of the head up to the middle line. This kind is very acute, and is commonly under the control of quinine, which must, however, be given in considerable doses. The sick headache described by Fothergill is among the most distressing and intractable forms, inasmuch as it cannot usually be referred to any distinct removable cause, and is but little under the control of remedies. It is to be met, however, like the other forms, chiefly by a regulation of the whole habits of life, especially as regards habitual exercise, which may, indeed, be regarded as the great specific for all kinds of headache.

HEAD BOROUGH, in England, is the head of a borough, or high constable, the latter name being now exclusively used. In Scotland, the words "head borough" are used in another sense—viz., as the head borough in the county where the sheriff holds his court and exercises his jurisdiction.

HEAD COURTS, in Scotch law, were the sheriff courts where the freemen did suit and service annually, now abolished by the act 20 Geo. II. c. 43.

HEADLEY, JOEL TYLER, b. N. Y. 1814; graduated at Union college, studied at the Auburn theological seminary, and was for a time pastor in Stockbridge, Mass. His health failing in 1842–3, he traveled in Europe, and on his return published *Letters from Italy*, and *The Alps and the Rhine*, subsequently he published *Napoleon and his Marshals*, *Sacred Mountains*, *Washington and his Generals*, *Adirondacks, or Life in the Woods*, *The Imperial Guard of Napoleon from Marengo to Waterloo*, *History of the Second War between England and the United States*, *Life of Havelock*, *The Great Rebellion*, *Chaplains and Clergy of the Revolution*, etc. In 1856 he was elected secretary of the state of New York.

HEALDS, or HEDDLES, AND **HEALD MACHINES.** In weaving, the threads of the warp are so arranged, that at each passage of the shuttle backwards and forwards, a certain number of the warp threads are raised up, and the remainder drawn down; this is done either with vertical threads, or lines, with a small loop in the middle, through which the warp thread is passed, there being one of the vertical threads for each horizontal or warp thread. The vertical threads are called healds; and as there is continual wear upon them, it is necessary they should be of considerable strength. They also require to be particularly smooth and round, in order that they may not, by their friction in moving up and down, chafe the threads of the warp. Hence the manufacture of heald yarns is a peculiar one, and employs the chief attention of several manufacturers, particularly in the neighborhood of Bradford, in Yorkshire, where they have been brought to great perfection by Messrs. Townend Brothers and others. For some purposes, the healds are made of metal, and this class of healds is also a special manufacture. Machines have been invented for the purpose of making thread healds without knots, as the knot made by the loop is a great impediment to the free action of the heald. Such a machine was invented by Mr. Judkins of Manchester. It is so constructed as to double and twist the single yarn, and at certain points braid and plait the yarn forming the eye or loop of the heald without knot of any kind. By this machine a series of healds can be made in a continuous cord, only requiring to be cut into lengths for use. The same inventor also produced a machine which fits metallic eyes or loops in the heald.

HEALTH (from the same root as *heal*, *hale*, whole), the state of the body or mind opposed to disease (q. v.) and characterized by the integrity or soundness (Lat. *sanus*) of all the parts and functions which constitute a living being. In the more restricted and ordinary sense, health is understood as referring chiefly to the body, and as indicating that perfect and harmonious play of all the functions which permits a man to be all that his Creator intended. Even in this sense, however, it may readily be admitted that absolute bodily health is one of the rarest of endowments; in common language, accordingly, the term is accepted with an indefinite limitation, to indicate a state consistent with a life reaching its ordinary physiological limit without any manifest and considerable departure from the ideal standard.

As the absolute and extreme duration of human life is uncertain, it is usual to regard as a healthy state of the system that in which a moderate degree of activity, without pain or inconvenience, is maintained beyond the limit of threescore-years-and ten, as indicated by the Psalmist. In point of fact, however, no considerable community of human beings can be said even to approach this term of life on an average of cases. Even where the adults are more than commonly long-lived, there is always a considerable mortality at very early ages, which tends to reduce the *statistical vitality*, so to speak, of the whole community below the point which would be indicated by an average of 70 years for the population at large. Thus, in a population dying at the rate of only 15 in 1000 annually (the lowest permanent rate in the returns of the registrar-general for England), the average age at death of the community, supposing the population to be absolutely free from change, would be only 66.6; and in the case of a death-rate of 20 in 1000, the average age at death would be 50; while a death-rate of 25 in 1000 (the actual death-rate of London, the healthiest of the great European capitals) would correspond to an average age at death of not more than 40. Setting aside fluctuations of population, which always exercise a certain influence on the result of such calculations, it may be said that the average duration of life in England and Wales is about 45 years, and in Scotland somewhat less than 50 years; and to the extent expressed by these figures, the health of these two great countries falls short of the ideal standard. This subject will be more fully considered under the article VITAL STATISTICS, in which a view will be given of the phenomena of the death-rate, as affecting the calculation of premature mortality, with a view to the removal of its causes in great communities. This department of science has assumed great importance of late years, in consequence of the efforts that have been made to improve the sanitary condition of our great towns and country districts by improved drainage and sewerage, a regulated supply of pure water, and the inspection, in certain circumstances, of lodging-houses, and even of private dwellings, so as to prevent overcrowding, and the other manifest causes of the spread of epidemic disease. These, and other great practical reforms, constitute the object of what has been called the "Public Health" movement in this country, some notice of the history, progress, and practical results of which is given under the head of SANITARY SCIENCE.

HEALTH, BILL OF, in Scotch law, means an application by a prisoner to be allowed to live out of the prison, on the ground of ill health. The application is now made to the county prison board, and if allowed, the prisoner is taken to a neighboring house, and kept under surveillance. The same thing is done in England under the prison regulation acts, though the phrase bill of health is not used there.

HEALTH, BILL OF, in shipping, means a certificate of a consul, etc., as to the health of the crew, when the ship has come from a suspected port. A clean bill, a suspected bill, and a foul bill, are the three short names given to the several degrees of health.

HEALTH ASSOCIATION, AMERICAN PUBLIC. On April 18, 1872, an informal conference was held in the city of New York of gentlemen representing five states and five cities, at which a committee was appointed to draw up a constitution for the organization of a national institution for the promotion of sanitary science. The committee made their report at a subsequent meeting held Sept. 12 and 13, at which there were representatives from New York, Pennsylvania, Ohio, Illinois, Louisiana, Connecticut, Rhode Island, and the District of Columbia. A constitution was adopted, and officers elected. This constitution was slightly amended at the next annual meeting held in New York Nov., 1873, and contained among its provisions the following: "The officers shall be a president, a first and second vice-president, a secretary and a treasurer. All the officers shall be elected by ballot annually, except the secretary, who shall be elected for a term of three years." A standing, executive committee consists of "the president, first vice-president, secretary and treasurer, and six members annually elected by ballot." The objects of the association are, to a great extent, served by annual meetings, when various matters of importance relating in various ways to sanitary science are discussed, the various essays and addresses being published in an octavo volume of from four to five hundred pages. For instance, the first volume of reports contains an address by the president "On the Limitations and Modifying Conditions of Human Longevity, the Basis of Sanitary Work." Among the papers read at meetings and published in this volume of reports, which was published in 1875, are "The Relations of Race and Nationality to Mortality in the United States." "Perfection in Structure in the Human Body as a Leading Element of Hygiene," "The General Causes of Disease," "A Report on the Sanitary Care and Utilization of Refuse of Cities," "A Report on Disinfection and Disinfectants," "General Principles Affecting the Organization of Quarantine," "What Can We Do Against Cholera?" There are also various papers on the cholera epidemic in the United States in 1873, and on the yellow fever which prevailed at the same time in different parts of the southern and southwestern states. The report also contains a paper on the "General Health Laws and Local Ordinances, Considered with Reference to State and Local Sanitary Organizations," which discusses in an able manner the following subjects among others: "State Organizations Essential to Local Efficiency," "The Registration of Vital Statistics," "Definition of, and Proceedings Against Nuisances," "Popular Instruction in Physiology and Hygiene." It also gives some account of state boards of health which had been organized up to that time.

HEALTH, METROPOLITAN BOARD OF, of New York. From the year 1800 most of the health laws of New York were intended rather to exclude disease from the city than to prevent its origin. Most of the health laws passed within that period, though valuable in many respects, were not sufficiently comprehensive. In 1864 the New York Citizens' association, in connection with several physicians, made a sanitary inspection of the city, which resulted in the passage of an act Feb. 26, 1866, creating a "metropolitan sanitary district and board of health therein, for the preservation of life and health, and to prevent the spread of disease." The act provided that four suitable persons, one a resident of Brooklyn, together with the health officer of the port of New York for the time being, shall be sanitary commissioners in and for the sanitary district (the metropolitan police district); and that the said sanitary commissioners, together with the commissioners for any time being of the metropolitan board of police, not exceeding four, shall constitute a board of health for the said sanitary district. The first commissioners appointed held office for one, two, three, and four years, respectively, after which the term of office was to be four years. Provision was made for the appointment of a chief executive officer, to be called the sanitary superintendent, who was required to be a skillful physician. Many powers were conferred on the board and on the executive officer, in abating health nuisances, removing buildings dangerous to life or health, etc. Dr. Elisha Harris was appointed registrar of vital statistics. See HEALTH, MUNICIPAL BOARD OF.

HEALTH, MUNICIPAL BOARDS OF. Institutions organized under city government, and deriving powers from state laws for the purpose of protecting the health of the citizens. The present board of health of the city of New York is a municipal board. From 1866 to 1870 there was a united health department of the cities of New York and Brooklyn, under the title of metropolitan board of health (see HEALTH, METROPOLITAN BOARD OF—NEW YORK). Chapter 137 of the laws of New York, passed April 5, 1870, provides that the city of New York be exempted from the provisions of the act which created the metropolitan board of health, and also created a health department, to consist of the police commissioners of the city of New York, the health officer of the port, and also

four officers, to be called "commissioners of health of the city of New York," to be appointed by the mayor for a term of five years—two of whom must have been practicing physicians in the city for a period of five years preceding their appointment. In 1873 an act to reorganize the local government of the city of New York made the following provisions: "The health department shall consist of the president of the board of police, the health officer of the port, and two officers to be called 'commissioners of health,' one of whom shall have been a practicing physician for not less than five years preceding his appointment. The commissioner of health who is not a physician shall be president of the board, and shall be so designated in his appointment. These several officers shall together constitute a board which shall be the head of the health department. The commissioners of health, except those first appointed, shall hold their offices for six years." The act also created two bureaus, the chief officer of one to be called the "sanitary superintendent, who at the time of his appointment shall have been for at least ten years a practicing physician, and for three years a resident of the city of New York, and who shall be the chief executive officer of said department. The chief officer of the second bureau shall be called the register of records, and in said bureau shall be recorded, without fees, every birth, marriage and death, and all inquisitions of coroners which shall occur or be taken within the city of New York." By an amendment to this act, the powers conferred on the metropolitan board of health by the laws of 1866, or any subsequent laws not inconsistent with this act, are conferred upon and vested in the health department and board of health created in its place. The health department, as organized under the act, consisted of the board of health, composed of the four officers above mentioned, viz., the commissioners of health, the health officer of the port, and the president of the board of police, together with a secretary, and the following "officers of the board:" a sanitary superintendent, a register of records, an attorney and counsel, a chief clerk, a consulting sanitary engineer, a consulting pathologist, a consulting meteorologist, a consulting microscopist, a consulting veterinary surgeon, a consulting sanitary architect, nine sanitary inspectors (all of whom were physicians), sixteen assistant sanitary, twelve of whom were physicians. The secretary's department consisted of the secretary of the board, a chief clerk, an auditing clerk, and chief clerk to the secretary, and four other clerks. The attorney's department consisted of the attorney and counsel of the board, and three clerks. The bureau of sanitary inspection consisted of the sanitary superintendent, an assistant sanitary superintendent, a chief clerk to the superintendent, four other clerks, a chief of disinfecting corps, and eight other members of the disinfecting corps. The bureau of vital statistics consisted of the register of records, a deputy register of records, and eleven clerks. By chapter 677, laws of 1872, and by chapter 335, laws of 1873, "the board of police has full and exclusive power and authority, and is charged with the duty of causing all streets, avenues, lanes, alleys, gutters, wharves, piers, and heads of slips to be thoroughly cleaned from time to time, and to be kept at all times thoroughly clean."

Every city of importance in the United States has a municipal board of health. A good example is that of the health department of the city of Boston. At the present time, 1881, the board consists of three citizens, one of whom is a physician, and six "officers of the board," viz.: 1. A superintendent of health, who is not a physician; 2. a city physician; 3. an assistant city physician; 4. a port physician, and 5. a medical inspector. The seventh annual report of the board of health of Boston for the year ending April 30, 1879, is a model of brevity and conciseness. In regard to street cleaning it says: "The faithfulness and zeal with which the superintendent of health endeavors to keep the streets properly swept and free of nuisances is commendable in the highest degree. As a rule, the streets are in a cleanly condition, and a source of pride rather than a source of offense." The health department of New Haven, Conn., consists of six citizens, one of whom is a physician, a health officer, who is a physician, a quarantine officer, who is a physician, a standing committee of two, one of whom is a physician, and two sanitary inspectors. The report of the health officer for the year 1879 furnishes strong evidence that privy vaults and cesspools are the most frequent generators of typhoid fever and diphtheria to a great extent, because of the prevalent habit of having wells for drinking water in near proximity to them.

HEALTH, National Board of, an organization for the promotion of sanitary measures. It was organized under act of congress, Mar. 3, 1879, entitled "An act to prevent the introduction of infectious and contagious diseases into the United States, and to establish a National Board of Health." This provided for the appointment by the president of seven members, not more than one of whom shall be appointed from any one state, to be paid only for time in which they are actually engaged, at the rate of ten dollars a day and reasonable expenses. To these persons there are added one medical officer of the army, one medical officer of the navy, one medical officer of the marine hospital service, and one officer from the department of justice, to be detailed by the secretaries of the several departments and the attorney general respectively, the officers so detailed receiving no compensation. The board chooses its own president and makes its own rules, and also special examinations, as it may deem proper, within the United States or at foreign ports. They are to obtain information upon all matters affecting the public health, and advise the several departments of the government on all matters

submitted to them, or whenever they think advice needed. According to the first annual report made to the secretary of the treasury Jan. 1, 1880, the members of the board proceeded to organize April 2, 1879; and since the first meeting the board has met eight times, once at Atlanta, Ga., once at Nashville, Tenn., and on the other occasions at Washington. The report of the board states that these frequent meetings were necessary, because the law did not recognize the existence of an executive committee; nevertheless such executive committee held daily meetings at the national capital, and had charge of the routine business of the board. The board in their report stated that they coincided with opinions expressed in resolutions of the American public health association at a convention held at Nashville, Tenn., in Nov., 1879, and which are "that the quarantine laws of the United States should be under the direction of the National Board of Health, and of an executive committee to be selected by that body." They moreover recommend the assembling of an international health congress. They also recommend the establishment of a quarantine station at the mouth of the Mississippi river, at a place to be designated by the national board. Information was collected in regard to the sanitary condition of some of the principal cities in the United States, and a commission was appointed to investigate yellow fever in the island of Cuba. The commission sailed for Havana July 4, and returned on Oct. 4, 1879. See YELLOW FEVER. Various other questions received the attention of the board, such as diseases of food-producing animals, the merits of various disinfectants, adulterations in food and drugs, an investigation of the flow of sewers (see SEWAGE), a sanitary survey of the eastern coast of New Jersey, bordering on New York harbor, in connection with the state board of health of New Jersey, and a sanitary survey of the city of Memphis, Tenn. See SANITARY SURVEY. The report also gives a sketch of the operations of the board under the provisions of the act approved June 2, 1879, to prevent the introduction of contagious or infectious diseases. See QUARANTINE. This act states that one of the objects of the organization shall be to co-operate with and aid, as far as it lawfully may, state and municipal boards of health in the execution and enforcement of rules to prevent the introduction of contagious or infectious diseases into the United States. It is also made the duty of the board to obtain information of the sanitary condition of foreign ports and places from which contagious diseases may be imported; and it is provided that the consular officers of ports designated by the board shall make to said board weekly reports of the sanitary condition of the ports and places at which they are respectively stationed. Provision is also made for obtaining reports of the sanitary condition of ports and places within the United States, transmitting the information so obtained to the medical officers of the marine hospital service, to collectors of customs at the ports, and to state and municipal health officers, together with any important information relating to sanitary affairs which they may possess. Five hundred thousand dollars is appropriated, or so much as may be necessary to meet the expenses to be incurred in carrying out the provisions of the act, to be disbursed under the direction of the secretary of the treasury on estimates made by the board, and to be approved by him. It is also provided that the act shall continue in force for a period not longer than four years from the date of approval.

HEALTH, STATE BOARDS OF, institutions established by state legislative enactments, having many specific relations in regard to the public health, but intended to have a central advisory relation with local sanitary organizations, and also to superintend a state system of vital statistics. There are now in the United States 24 state boards. Massachusetts was the first to organize such a board, which she did in June, 1869, under a law which had been steadily asked for since 1850. California was the next state to organize a board, in 1870; Michigan and Louisiana followed in 1871, and Minnesota and Virginia in 1872; Alabama, Maryland, and Georgia in 1875; Colorado and Wisconsin in 1876; New Jersey and Illinois in 1877, Connecticut, Kentucky, Tennessee, Mississippi, and Rhode Island in 1878; Arkansas, Delaware, North Carolina, and Texas in 1879, and New York and South Carolina in 1880.

The act establishing the state board of health of New York was passed May 18, 1880. It provides for the appointment of "three state commissioners of health, two of whom shall be graduates of legally constituted medical colleges. The said commissioners together with the attorney-general, the superintendent of the state survey, and the health officer of the port of New York, who shall be ex officio members of the state board of health, and three other persons to be designated and appointed by the governor, one of whom shall be a commissioner of health of the board of health of the city of New York, and the others shall be members or commissioners of health of regularly constituted and organized boards of health of cities of the state, shall constitute a board of health of the state of New York." The said three commissioners first named shall hold their office for three years, and whenever a vacancy occurs the place shall be filled as in other cases provided by law. Meetings shall be held at least once in every three months, and as much oftener as shall be deemed necessary. No member of the board except the secretary shall receive any compensation, but the actual traveling and other expenses of the members and officers while on duty shall be allowed and paid out of the appropriation made for its support. They shall elect annually one member of the board to be president, and from their own members or otherwise a person of

skilled experience in public health duties to be secretary and executive officer of the board, who shall have all the powers and privileges of a member of the board, except in regard to voting upon matters relating to his own office, to hold office for three years. The state board has the general supervision of the state system of registration of births, marriages, and deaths, and also of prevalent diseases. There are in (1880) the state of New York 333 incorporated villages, each of which under a general statute of 1870 may have a good local board of health. There are besides 939 townships, each of which may organize a local board of health, which shall consist of the supervisor and a majority of the justices of the peace of the township. They are required to appoint a competent physician as health officer, who has the largest powers conferred on him by a state law of 1850, such as power to quarantine places, regulate sources of disease, disinfect, etc. The state board is continually causing sanitary surveys to be made of sickly localities, and there form data for present and future sanitary work.

HEALY, GEORGE PETER ALEXANDER, b. Boston, 1813, portrait painter, studied several years in Paris. His largest picture, "Webster's Reply to Hayne," containing 130 portraits, is in Faneuil hall. In the Paris exhibition (1855) he was awarded a medal for his picture of "Franklin urging the Claims of the American Colonies before Louis XVI." Among many portraits from his pencil are those of Louis Philippe, Marshal Soult, gen. Cass, Calhoun, Webster, Pierce, gen. Sherman, Brownson, Prescott, Longfellow, Guisat, George Peabody, cardinal McCloskey, and William H. Seward. He painted nearly 600 portraits within 20 years.

HEARD, a co. in w. Georgia on the Alabama border, intersected by the Chattahoochie river, 375 sq.m.; pop. '70, 8,769—3,095 colored. It is hilly, and largely covered with forests; soil fertile; chief products: cotton, wheat, corn, etc. Co. seat, Franklin.

HEARD'S ISLAND, in the s. Indian ocean, 280 m. s.e. of Kerguelen Land, in about 53° s. and 73° east. It measures about 30 by 10 m., and has a peak 6,000 ft. above sea level.

HEARING. See EAR.

HEARING OF A CAUSE is the phrase used in the court of chancery, when the merits of the case and the arguments on both sides are entered upon. The same phrase is used in cases before magistrates. But at common law, if it is a jury case, the corresponding term is "the trial;" and if it is a case before the judges in banc, it is called "the argument." In Scotland, it is called "the debate," if before the judges; if before the jury, "the trial."

HEARING IN PRESENCE, in the law of Scotland, means a hearing of a difficult or important case before the whole of the thirteen judges of the court of session. It is competent for either division of the court of session, when equally divided in opinion on a case, to appoint a hearing before the whole judges, which is in fact a reargument. In England it is not in general competent for any court, when equally divided, to order a case to be argued before all the other courts sitting together. The only case in which it occurs is where the court of criminal appeals has heard a case, and the judges differ considerably, or think it a very important case, when it is ordered to be argued before the full court, which consists of all the fifteen common law judges. It is then called a hearing before the full court.

HEARSAY EVIDENCE is the name given by lawyers to evidence given in a court of justice at second-hand, where the witness states not what he himself saw or heard, but what somebody else said. This evidence is, as a general rule, inadmissible, because the axiom is, that the best evidence that can be had must be produced, and therefore each witness must be confined to stating what he knows of his own personal knowledge, or what he has learned by the aid of his own senses; and as he is sworn to the truth, his truthfulness is thus secured, as far as human testimony can be so. If evidence were once admitted at second-hand, there would be no limit to its uncertainty, and there would be thus introduced vague statements of absent persons, who, not being sworn when they made them, are therefore incapable of being punished if they speak falsely, and cannot be cross-examined. Though such is the general rule, yet there are a few exceptions which are unavoidable, owing to the nature of the thing. Thus, in proving pedigrees, the hearsay evidence of persons connected with the family, and those only, is admitted in England; but in Scotland it is admitted though the persons were not connected with the family. A remarkable exception also exists in the case of dying declarations, i.e., statements made by persons mortally wounded and in the prospect of death; but in England such evidence is only admitted in criminal cases, on a charge of manslaughter or murder. In Scotland such declarations are admitted in all cases of violence, and though the party at the time did not believe he was dying. There is another exception to the non-admissibility of hearsay evidence allowed in Scotland, but not in England, viz., where the person who made the statement is dead, and therefore cannot be produced as a witness. In England there is no help for such a state of things, and the statements of the dead person cannot be admitted; but in Scotland, if there was no reason to suppose the contrary, it is presumed the dead witness spoke the truth, and what he said may be given in evidence for what it is worth, both in civil and

criminal cases. A few other exceptions, of a less important description to the above general rule, exist in both countries, which are too technical to be here noticed.

HEARSE. See HEARSE, *ante*.

HEART. See CIRCULATION OF THE BLOOD.

HEART, DISEASES OF THE, a class of serious, and often fatal disorders affecting the great center of the circulation, the accurate knowledge of which may be dated from the application of auscultation (q.v.) and percussion to the purposes of diagnosis. The great names of Corvisart and Laennec stand foremost in the modern investigation of cardiac diseases, Dr. Hope of London, and a great number of living physicians, having largely contributed to the existing knowledge of the subject, which had, however, been carefully studied by Morgagni and the great morbid anatomists of the 18th c., as well as by Senac and Testa, without the advantage of the more recent means of diagnosis. The limits of this article admit of only a very slight sketch of a subject of vast extent, and on which the literature of the last 50 years is unusually copious and exhaustive.

Diseases of the heart may be roughly divided into the functional and organic—in the former of which no appearances adequate to account for the symptoms are found in the dead body, while in the latter the contrary is the fact. To the former class belong simple palpitation, syncope, and the peculiar disorder termed angina pectoris; to the latter, hypertrophy of the heart, dilatation of the cavities, with various structural diseases of the endocardium and pericardium, of the muscular fiber, and of its nutrient arteries. To these may be added the disease of the aorta, and especially aneurisms of its thoracic portion. We propose to review very briefly these different morbid conditions.

Palpitation, or undue and often irregular action of the heart, attended by uneasy sensations of movement, is a disorder common to many organic diseases of the heart, and not unfrequently also occurring in debilitated states of the system, without any organic disease whatever. In exhausted and anxious men of business, in hysterical and anæmic women, in habitual smokers, in dyspeptics, in persons debilitated by discharges from the mucous membranes, a degree of palpitation is quiet common, and the symptom sometimes assumes the apparent form of an independent disease, especially when aggravated by mental anxiety in respect to its true significance. The treatment is entirely guided by the facts of the individual case; but generally speaking, the negative results of physical diagnosis, with the positive knowledge of the cause, suffice to reassure both practitioner and patient, and lead to a correct adaptation of means to the end in view.

Syncope, or swooning, is, as every one knows, much more commonly a functional than an organic disease. See FAINTING.

Angina pectoris, or breast-pang, also called *syncope anginosa*, is a peculiar painful or oppressive sensation, very characteristic of cardiac diseases, especially of such as are apt to prove suddenly fatal. It is needless to add that this form of disease is of great importance, and of very dreadful significance. The two leading elements in the sensation referred to, according to Dr. Latham, are the pain and the sense of impending death. The sensation is entirely different from breathlessness, although often mixed up with this in the mind of the patient. Where the sudden, death-like paroxysm of angina comes on in the absence of medical assistance, the proper remedies are, warmth to the extremities, stimulants, and moderate doses of laudanum or opium; but no time should be lost in procuring the aid of instructed persons, as errors in the administration of these powerful remedies might be more rapidly fatal than the disease itself.

Asthma, and difficulty of breathing depending upon the lungs, especially that form of difficult breathing called *orthopnœa*, when the patient is unable to lie down in bed, are symptoms very characteristic of some kinds of disease of the heart and great vessels.

The organic diseases of the heart are very numerous; most of them are attended by one or other of the symptoms above mentioned, and almost all of them involve danger to life more or less considerable. It is nevertheless true that public opinion, nowadays, is prone to overrate the tendency to death, and especially to sudden death, in some of these diseases. Strictly speaking, a sudden death—i.e., a death quite unexpected, and in the midst of apparent good health—is a rare and exceptional fact in organic disease of the heart; the most frequent instances being in connection with aneurisms (q.v.) of the great vessels, fatty degeneration of the heart's fiber, and extensive calcareous degeneration of the coronary arteries of the heart, often producing marked symptoms of angina pectoris, as above referred to.

The *valvular diseases of the heart* are among the most frequent and the most easily recognizable of its organic disorders. They depend essentially upon changes in the endocardium, or internal lining membrane (endocarditis); in many cases these changes originate in attacks of rheumatic fever (see RHEUMATISM), which is therefore to be viewed with suspicion as a disease tending to shorten life, especially when developed during early youth. The valves affected are usually those of the left side, and the consequence may be either imperfect closure of the valve, leading to regurgitation of blood, or obstruction of the orifice. In either case, there is a mechanical impediment to the circulation, of a more or less serious kind, followed by dilatation of the cavities of the heart and hypertrophy of the walls, especially of the ventricles. For a time the circulation is kept up under these unfavorable conditions by increased efforts of the organ;

but ultimately its balance is fatally disturbed, blood accumulates in the liver, the lungs, or others of the internal organs, and secondary diseases take place, of which dropsy (q.v.), albuminuria, and hæmoptysis, or spitting of blood, are among the most frequent and formidable.

Pericarditis, or inflammation of the pericardium, i.e., the heart-purse, or fibrous sac investing the heart, is, like endocarditis, a frequent consequence of acute rheumatism. In numerous instances, it ends favorably, but in some cases it is fatal by large effusion of fluid, and in others by adhesions between the external membrane and the heart.

The treatment of all these diseases must be strictly regulated by medical advice.

HEART, SOUNDS OF THE. On applying the ear to the cardiac region of a living man or mammal, in a state of health, two successive sounds are heard, each pair of which corresponds with one pulsation. These are known as the *first* and the *second* sound. There is scarcely any interval between these two different sounds, the second one following immediately upon the conclusion of the first; but after the second sound there is a perceptible pause before the first sound is again heard. The *first* sound is dull and prolonged, while the *second* is short and sharp, and the difference between them is well expressed (as Dr. C. J. B. Williams has remarked) by articulating the syllables lubb dŭp.

The cause of the first of these sounds has been a subject of much discussion, at least 30 explanations of its mode of production having been offered. During the first sound, several distinct actions are taking place, to each of which it has been ascribed by different physiologists. Thus we have (1) the impulse of the apex of the heart against the side of the chest; (2) the contraction of the muscular walls of the ventricles; (3) the tension of the auriculo-ventricular (tricuspid and mitral) valves (see CIRCULATION); (4) the rush of blood through the narrowed openings of the aorta and pulmonary artery; and (5) the collision of the particles of blood with one another, and their friction against the sides of the heart's cavities.

The hearts of mammals being constructed like our own, give out sounds different in degree, but not in character, from the sounds heard in man. In birds (if we except the ostrich and the apterix, whose hearts approximate to the mammalian type), there is no perceptible difference between the first and second sound; and Dr. Halford has ingeniously explained why this should be in his essay on *The Action and Sounds of the Heart.* The action of the heart in reptiles (the alligator, python, and turtle) seems to be accompanied with no definite sounds.

When the valves are changed by disease, the sounds undergo special alterations, which are of the highest importance in diagnosis.

HEARTH-MONEY, an old tax in England, abolished by 1 Will. and Mary, s. 1, c. 10.

HEARTS CONTENT, a port of Newfoundland on Trinity bay, 47° 50′ n. and 53° 20′ w. It is an excellent harbor, and the surrounding scenery is fine. The Atlantic telegraph cables land here.

HEAT, the unknown cause of the sensation of warmth, and of a multitude of common phenomena in nature and art. In considering this subject scientifically, it is necessary, at the outset, to discard the ideas conveyed by the popular use of such words as heat and cold. A number of bodies, however different, left for a long enough time in the same room, must, as we shall see further on, acquire the same *temperature*, or become in reality equally warm. Yet in popular language, some, as metals, stones, etc., are pronounced to be cold, and others, as flannel and fur, warm. The touch, then, is *not* a means by which we can acquire any definite idea of the temperature of a body.

Nature of Heat.—A heated body is no heavier than it was before it was heated; if, therefore, heat be a material substance, as it was long considered, it must be *imponderable.* And, in fact, under the name of caloric or phlogiston, it is classed, in almost all but modern treatises, as one of the family of imponderables. But if it were *matter*, in any sense of the word, its quantity would be unchangeable by human agency. Now we find that there are cases in which heat is produced in any quantity without flame, combustion, etc., as in melting two pieces of ice by rubbing them together, and also cases in which a quantity of heat totally disappears. This is utterly inconsistent with the idea of the materiality of heat. The only hypothesis that at all accords with the phenomena is, that *heat is a form of motion*, and with this idea we shall start.

Measure of Heat.—Whether it be a vibration, such as light and sound (in some cases, it certainly is), or consist in a succession of *impacts* of the particles of bodies on each other (as in some cases it has been considered to be), it is none the less certain that the *amount* of heat in a body is to be measured by the vis-viva (see FORCE) of moving particles. But as we cannot observe those particles so as to ascertain their vis-viva, we must have some means of measuring the temperature of a body, depending upon an *effect* of heat. Whatever that effect may be, it is obvious that, as the laws of nature are uniform, it will afford us a *reproducible* standard, by which we can estimate its amount at any time and in any place, and compare that amount with another observed somewhere else; just as the French mètre (q.v.) is reproducible at any time, being the ten-millionth part of a quadrant of the meridian.

Dilatation or Expansion.—Now, the most general and notable effect which heat produces on matter is to *expand* it. The length of a metallic bar varies with every change

of temperature, and is ever the same at the same temperature. The fixing of the tire of a cart-wheel is a very good instance. No hammering could fit an iron hoop so tightly on the woodwork of the wheel, as the simple enlarging of the tire by heat, and its subsequent contraction by cold. It is thus possible to *slip* it on, and an enormous force is secured to bind the pieces together. In almost every kind of structure, the expansion and contraction from changes of temperature require to be guarded against. In the huge iron tubes of the Britannia bridge, the mere change of the seasons would have produced sufficient changes of length to tear the piers asunder, had each end of the tube been fixed to ma-onry. Watches and clocks, when not compensated (see PENDULUM), go faster in cold weather, and slower in hot, an immediate consequence of the expansion or contraction of their balance-wheels and pendulums.

If a flask *full* of water or alcohol be dipped into hot water or held over a lamp, a portion of the liquid runs over; a glass shell which floats in a vessel of water, sinks to the bottom when the water is heated; and as water is heated, the hotter water continually rises to the surface. Indeed, if the latter were not the case, it would be impossible to prevent explosions every time we attempted to boil water or any other fluid. If a bladder, partly filled with air, and tightly tied at the neck, be heated before a fire, the contained air will expand, and the bladder will be distended. As it cools, it becomes flaccid again by degrees.

These and like instances are sufficient to show us that *in general* all bodies expand by heat. In order, then, to prepare a reproducible means of measuring temperature, all we have to do is to fix upon a substance (mercury is that most commonly used) by whose changes of volume it is to be measured, and a reproducible temperature, or rather two reproducible temperatures, at which to measure the volume. Those usually selected are —that at which water freezes, or ice melts, and that at which water boils. In both of these cases, the water must be *pure*, as any addition of foreign matter in general changes the temperature at which freezing or boiling takes place. Another important circumstance is *the height of the barometer*. See BOILING. The second reproducible temperature is therefore defined as that of water boiling in an open vessel when the barometer stands at 30 inches. In absolute strictness, this should also be said of the freezing-point, but the effect on the latter of a change of barometric pressure is practically insensible. The practical construction of a heat-measurer or *thermometer* on these principles, the various ways of graduating it, and how to convert the readings of one thermometer into those of another, are described in the article THERMOMETER. In the present article, we suppose the centigrade thermometer to be the one used,

If we make a number of thermometer tubes, fill them with different liquids, and graduate as in the centigrade, we shall find that, though they all give 0° in freezing, and 100° in boiling water, no two in general agree when placed in water between those states. *Hence the rate of expansion is not generally uniform for equal increments of heat.* It has been found, however, by very delicate experiments, which cannot be more than alluded to here, that mercury expands *nearly* uniformly for equal increments of temperature. However, what we sought was not an *absolute* standard, but a *reproducible* one; and mercury, in addition to furnishing this, may be assumed also to give us the ratios of different increments of temperature.

We must next look a little more closely into the nature of dilatation by heat. And first, of its *measure*. A metallic rod of length l at 0°, increases at $t°$ by a quantity which is proportional to t and to l. Hence k being some numerical quantity, the new length $l' = l(1 + kt)$. Here k is called the coefficient of linear dilatation. For instance, a brass rod of length 1 ft. at 0°, becomes at $t°$ $(1 + .0000187t)$ ft.; and here k, or the coefficient of linear dilatation for one degree (centigrade), is .0000187; or a brass rod has its length increased by about $\frac{1}{53{,}000}$th part for each degree of temperature.

If we consider a bar (of brass, for instance) whose length, breadth, and depth are l, b, d—then, when heated, these increase proportionally. Hence,

$$\begin{aligned} l' &= l(1 + kt), \\ b' &= b(1 + kt), \\ d' &= d(1 + kt); \end{aligned}$$

and therefore the volume of, or space occupied by, the bar increases from V or lbd to V' or $l'b'd'$.

$$\begin{aligned} \text{Hence } V' &= V(1 + kt)^3, \\ &= V(1 + 3kt) \text{ nearly, since } k \text{ is } \textit{very small}. \end{aligned}$$

Therefore we may write $V' = V(1 + Kt)$, where we shall have as before K, the coefficient of *cubical* dilatation for 1° of temperature. And, as $K = 3k$, we see that, for the same substance, the *coefficient of cubical dilatation is three times that of linear dilatation*.

In the following table, these coefficients are increased a hundredfold, as it gives the proportional increase of volume for a rise of temperature from 0° to 100° centigrade. It must also be remarked, that while the *linear* dilatation of solids is given, it is the cubical dilatation of liquids and gases which is always observed. Moreover, as the latter are always measured in glass, which itself dilates, the results are only *apparent;* they are too

small, and require correction for the cubical dilatation of glass. This, however, is comparatively very small, and may in general be neglected.

Glass	.00086	Water	.0466
Iron	.00122	Alcohol	.116
Zinc	.00294	Air	.3665
Mercury	.01543	Hydrogen	.3668

There is one remarkable exception to the law that bodies expand by heat—viz., that of water, under certain circumstances. From 0° (centigrade), at which it melts, it *contracts* as the heat is increased, up to about 4° C., after which it begins to expand like other bodies. We cannot here enter into speculations as to the cause of this very singular phenomenon, but we will say a few words about its practical utility. Water, then, is *densest* or *heaviest* at 4° C. Hence, in cold weather, as the surface-water of a lake cools to near 4°, it becomes heavier than the hotter water below, and sinks to the bottom. This goes on till the whole lake has the temperature 4°. As the cooling proceeds further, the water becomes *lighter*, and therefore remains on the surface till it is frozen. Did water not possess this property, a severe winter would freeze a lake *to the bottom*, and the heat of summer might be insufficient to remelt it all.

Specific Heat.—The thermometer indicates the *temperature* of a body, but gives us no direct information as to the *amount* of heat it contains. Yet this is measurable, for we may take as our UNIT the amount of heat required to raise a pound of water from 0° to 1°, which is of course a definite standard. As an instance of the question now raised—Is *more* heat (and if so, *how much more*) required to heat a pound of water from zero to 10°, than to heat a pound of mercury between the same limits? We find by experiment that bodies differ extensively in the amount of heat (measured in the units before mentioned) required to produce equal changes of temperature in them.

It is a result of experiment (sufficiently accurate for all ordinary purposes) that if equal weights of water at different temperatures be mixed, the temperature of the mixture will be the arithmetic mean of the original temperatures. From this it follows, with the same degree of approximation, that equal successive amounts of heat are required to raise the same mass of water through successive degrees of temperatures. As an instance, suppose one pound of water at 50° to be mixed with two pounds at 20°, the resulting temperature of the mixture is 30°; for the pound at 50° has lost 20°, while each of the other two pounds has gained 10°. Generally, if m pounds of water at t degrees be mixed with M pounds at T degrees (the latter being the colder), and if θ be the temperature of the mixture—the number of units lost by the first is $m(t-\theta)$, since *one* is lost for *each* pound which cools by *one* degree; and that gained by the second is $M(\theta-T)$, and these must be equal. Hence $m(t-\theta) = M(\theta-T)$, whence, at once,

$$\theta = \frac{mt + MT}{m + M};$$

But if we mix water and mercury at different temperatures, the resulting temperature is found *not* to agree with the above law. Hence it appears that *to raise equal weights of different bodies through the same number of degrees of temperature, requires different amounts of heat.* And we may then define the *specific heat* of a substance as the number of units of heat required to raise the temperature of *one* pound of it by *one* degree.

By the definition of a unit of heat, it is at once seen that the specific heat of water is unity; and, in general, the specific heats of other bodies are less, and are therefore to be expressed as proper fractions. For example, if equal weights of water and mercury be mixed, the first at 0°, the second at 100°, the resulting temperature will not be 50° (as it would have been had both bodies been water), but 3°.23 nearly—in other words, the amount of heat which raises the temperature of 1 pound of water 3°.2, is that which would raise that of 1 pound of mercury 96°.77, or the specific heat of mercury is $\frac{1}{30}$th of that of water. The following may be given as instances of the great differences which experiment has shown to exist among bodies in respect of specific heat: Water, 1.000; turpentine, .426; sulphur, .203; iron, .114; mercury, .033.

It is mainly to the great specific heat of water that we are indebted for the comparatively small amount of it required to cool a hot body dropped into it; for its comparatively small loss of temperature when it is poured into a cold vessel, and the enormous effects of the water of the ocean in modifying climate.

It has been found generally, with a few exceptions, that the specific heats of bodies are nearly *inversely* as their atomic weights (q.v.). *Hence all atoms require the same amount of heat to produce the same change in their temperature.* Thus, for simple bodies, we have atomic weight of mercury, 100 its specific heat, .033; product, 3.3; atomic weight of iron, 28; its specific heat, .114; product, 3.2. A similar remark may be made, it appears, with reference to compound bodies of the same type; but, in general, the product of the specific heat and the atomic weight differs from one type to another.

Latent Heat, Fusion, Solution, and Vaporization.—We are now prepared to consider the somewhat complex effects produced by heat on the molecular constitution of bodies; and, conversely, the relations of solidity, fluidity, etc., to heat. All bodies (except car-

bon, which has been *softened* only) have been melted, by the application of a proper amount of heat. The laws of this fusion are:

1. *Every body has a definite melting-point, assignable on the thermometric scale, if the pressure to which it is subjected be the same.*

2. *When a body is melting, it retains that fixed temperature however much heat may be applied, until the last particle is melted.* The last result is most remarkable. The heat applied does not raise the temperature, but *produces the change of state.* Hence it seemed to disappear, as far as the thermometer is concerned, and was therefore called *latent* heat.

A pound of water at 79° C. added to a pound of *water* at 0° C., produces, of course, 2 pounds of water at 39°.5. *But*, a pound of water at 79° C. added to a pound of *ice* at 0° C., produces 2 pounds of water at 0°. Heat, then, has *disappeared* in the production of a change from solidity to fluidity. And this we might expect from the conservation of energy (see FORCE), for actual energy in the shape of heat must be consumed in producing the potential energy of the molecular actions in the fluid. For every pound of ice melted, without change of temperature, 79 units of heat are thus converted into change of molecular arrangement.

We give a few instances of latent heat of fusion: Water (as above), 79.0; zinc, 28.1; sulphur, 9.4; lead, 5.4; mercury, 2.8.

In law 1, it is mentioned that constancy of pressure is necessary. In fact, the freezing (or melting) point of water is *lowered* by increase of pressure, while those of sulphur and wax are *raised;* but these effects, though extremely remarkable, are *very small.* Most bodies contract on solidifying; some, however, as water, cast-iron, type-metal, etc., *expand.* Thus, a severe frost setting in after copious rain splits rocks, etc., by the expansion of freezing water; and thus also we obtain in iron the most delicate and faithful copy of a mold, and in the fusible alloy a clear-cut copy of a type. The modern dynamical theory of heat enables us to see that a perpetual motion would be procurable, if bodies which contract on solidifying had *not* their melting point raised by pressure, and *vice versâ.*

Analogous to the fusion of a solid is its *solution* in a liquid, or the mutual conversion into liquids of two solids which are intimately mixed in powder. Here, also, we should expect actual energy in the shape of heat, to be used up in producing the potential energy of the fluid state; and, indeed, such is always the case. Such changes of arrangement destroy heat, or produce cold; but this in many cases is not the effect observed, as heat is generally developed by the *loss* of potential energy, if there be *chemical* action between the two substances. Hence in general, the observed effect will be the difference of the heat *generated* by chemical action, and that *absorbed* in change of state.

If a quantity of powdered nitrate of ammonia (a very soluble salt) be placed in a vessel, an equal weight of water added, and the whole stirred for a minute or two with a test-tube containing water, the heat required for the solution of the salt will be abstracted from all bodies in contact with the solution, and the water in the test-tube will be frozen. In this sense, the compound is called a *freezing mixture.* For additional illustrations of heat becoming latent, see FREEZING MIXTURE.

Of course the converse of this may be expected to hold, and latent heat to become sensible when a liquid becomes solid. As an example, when a saturated solution of sulphate of soda begins to deposit crystals of the salt, the temperature rises very considerably; and it is the disengagement of latent heat that renders the freezing of a pond a slow process, even after the whole of the water has been reduced nearly to the freezing-point.

Vaporization.—Almost all that has been said on the subject of fusion is true of vaporization, with the change of a word or two. Thus, however much heat we apply to a liquid, the temperature does not rise above the boiling-point. Heat, then, becomes *latent* in the act of vaporization, or rather is *converted into* change of state. It is found by experiment that 540 units of heat (each sufficient to heat a pound of water 1° C.) disappear in the conversion of a pound of water into steam. Hence a pound of steam at 100° C. is sufficient to raise 5.4 pounds of water from zero to the boiling-point.

Communication of Heat.—There are at least three distinct ways in which this occurs, and these we will take in order.

Conduction.—Why is it that if one end of a poker and of a glass or wooden rod be put into a fire, we can keep hold of the other end of the latter much longer than we can of the former? The reason is, that heat is more readily transmitted in the iron from particle to particle, than it is in glass or wood. This is conduction. It is to be noticed, however, that in this experiment a great portion of the heat which passes along each rod is given off into the air by the surface. The mathematical theory of conduction has been most exquisitely investigated by Fourier, and after him by Poisson, but on the supposition that the rate at which heat passes from a warmer to a colder portion of the body is proportional to the *difference* of temperature. As most of the experiments which have been made with the object of ascertaining the *conductivity* (*not* conductibility, the erroneous word in common use) of different bodies have been made in this way, it is not surprising that our knowledge on this point is very meager indeed. We know that silver conducts better than most other metals, and that the metals in general conduct better than other solids; but here our present information ends. It is satisfactory to know, however, that the defects of the old methods are now fully acknowledged, and that the important

element of conductivity will shortly be accurately known for all important substances. Forbes has recently shown that the conductivity of iron diminishes as its temperature increases; and the same is probably true of other bodies. This invalidates the conclusions of the mathematical theories above mentioned, but the necessary corrections will be easily applied when the experimental data are completely determined.

In conjunction with their radiating power (see next section), the conductivity of bodies is most important as regards their suitableness as articles of clothing for hot or cold climates, or as materials for building or furnishing dwelling-houses. We need but refer to the difference between linen and woolen clothing, or to the difference (in cold weather) of sensation between a carpet and a bare floor, in order to show how essential the greater or less conducting power of bodies is to our everyday comfort.

Radiation.—By this is understood the passage of heat, not from particle to particle of one body, but through air or vacuum, and even through solid bodies (in a manner, and with a velocity quite different from those of conduction) from one body to another. There can be no doubt whatever as to radiant heat being *identical* with light, differing from red light, for instance, as red light differs from blue; i.e., having (see LIGHT) longer waves than those corresponding to red light. This idea might easily have arisen during the contemplation of a body gradually heated. At first, it remains dark, giving off only rays of heat; as its temperature increases, it gives us, along with the heat, a low red light, which, by the increase of the temperature, is gradually accompanied by yellow, blue, etc. rays, and the incandescent body (a lime-ball, for instance) finally gives off a light as white as that of the sun, and which, therefore, contains all the colors of sunlight in their usual proportions. In fact (see FORCE), there is great reason to believe that the sun is merely a mass of incandescent melted matter, and that the radiations it emits, whether called heat or light, merely differ in *quality*, not in *kind*. Taking this view of the subject at the outset, it will be instructive to compare the properties of radiant heat with those of light throughout.

Light, then, *moves* (generally) *in straight lines*. This is easily verified in the case of heat by the use of the thermo-electric pile (q.v.) and its galvanometer. Placing the pile *out* of the line from a source of heat to an aperture in a screen, *no* effect is observed; but deflection of the needle at once occurs when the pile is placed in the line which light would have followed if substituted for the heat.

A concave mirror, which would bring rays of light proceeding from a given point to a focus at another given point, does the same with heat, the hot body being substituted for the luminous one, and the pile placed at the focus. Heat, then, is *reflected* according to the *same laws* as light. A burning lens gives a capital proof of the sun's heat and light being subject to the same laws of *refraction*. When the solar spectrum (q.v.) is formed by means of a prism of rock-salt (the reason for the choice of this material will afterwards appear), the thermo-electric pile proves the existence of heat in all the colored spaces, increasing, however, down to the red end of the spectrum, and attaining its maximum *beyond* the visible light, just as if heat were (as it *must* be) light with longer waves.

Some bodies, as glass, water, etc., transmit, when in thin plates, most of the light which falls on them; others, as wood, metal, colored glass, etc., transmit none or little. A plate of rock-salt, half an inch thick, transmits 96 per cent of the rays of heat which fall on it; while glass, even of a thickness of one-tenth of an inch, transmits very little. In this sense, rock-salt is said to be *diathermanous*, while glass is said to be adiathermanous, or only partially diathermanous. Most of the simple gases, such as oxygen, hydrogen, etc., and *mixtures* of these, such as air, oppose very little resistance to the passage of radiant heat, but the reverse is the case with compound gases. Some recent experiments by Tyndall seem to show that the vapor of water is exceedingly adiathermanous. The question, however, cannot be considered as finally settled, since some of Tyndall's results are so startling as to require further research and confirmation.

But there are other remarkable phenomena of radiant heat easily observed, which have their analogy in the case of light. 1. Unstained glass seems equally transparent to all kinds of light. Such is the case with rock-salt and heat. 2. Light which has passed through a blue glass (for instance) loses far less per cent. when it passes through a second plate of blue glass. Similarly, heat loses say 75 per cent in passing through *one* plate of crown-glass, and only 10 per cent of the remainder (say) in passing through a second. 3. Blue light passes easily through a *blue* glass, which almost entirely arrests red light. So dark heat passes far less easily through glass than bright heat does. These analogies, mostly due to Melloni, are very remarkable.

Again, light can be *doubly refracted, plane polarized, circularly polarized*. All these properties have been found in heat by principal Forbes (q.v.).

The beautiful investigations of Stokes and Kirchoff on the solar spectrum have shown us that bodies which most easily *absorb* light of a particular color, when heated, give off most freely light of that color; and it is easily shown by experiment, that those surfaces which absorb heat most readily also radiate it most readily. Thus, it was found by Leslie, that when a tinned-iron cube full of boiling water had one side polished, another roughened, a third covered with lampblack, etc., the polished side radiated little heat, the roughened, more, while the blackened side radiated a very great quantity indeed. And again, that if we have (say) three similar thermometers, and if the bulbs be (1) gilded, (2) covered

with roughened metal, (3) smoked, and all be exposed to the same radiation of heat, their sensibility will be in the order, 3, 2, 1. A practical illustration of this is seen in the fact, that a *blackened* kettle is that in which water is most speedily boiled, while a polished one keeps the water longest warm when removed from the fire. Again, if a willow-pattern plate be heated white-hot in the fire, and then examined in a dark room, the pattern will be reversed—a white pattern being seen on a dark ground. This experiment of Stewart's is very remarkable, and virtually constitutes an anticipation of Kirchoff's results leading to the explanation of the fixed lines in the spectrum (q. v.). It is this law of radiation and absorption that mainly gives rise to the superior comfort of white clothing to black in winter as well as in summer; radiating less in winter, it absorbs less in summer.

Much has been argued about the separate existence of *cold*, from such facts as these: A piece of ice held before the thermo-electric pile, produces an opposite deflection of the galvanometer to that due to a hot ball. If a freezing mixture be placed at one focus of a spheroidal mirror, and a thermometer with a blackened bulb at the conjugate focus, the latter will fall speedily, though very far off from the mixture. Now, the real explanation of such observations is to be found in what is called the "theory of exchanges," first enunciated by Prevost, and since greatly extended and carefully verified by Stewart, which is to this effect: "Every body is continually radiating heat in all directions, the amount radiated being (nearly) proportional to its own temperature." Hence the apparent radiation of cold in the experiments above mentioned is due to the fact of the pile or thermometer *radiating off more heat than it receives*, as its temperature is higher than that of the freezing mixture to which it is opposed. From this it is evident that any number of bodies left near each other, tend gradually to assume a common temperature. By this theory of exchanges, we explain the cold felt in sitting opposite a window in a frosty day, even when there is no draught.

Convection.—A hot body cools faster in a current of air than in a still atmosphere of the same temperature, evidently because fresh supplies of the colder air are continually brought into contact with it. It is by convection mainly that heat is conveyed from particle to particle in liquids and gases. Thus, when a lamp is applied to the bottom of a vessel of water, the heat does not diffuse itself in the water as it would (by conduction) in a mass of metal, but the expansion of the heated water at the bottom rendering it lighter, bulk for bulk, than the superincumbent fluid, causes it to rise to the surface; and thus, by convection, the heat is diffused throughout the mass. Conduction, properly so-called, can scarcely be shown, even if it really exist, in liquids or gases, on this account. The tremulous appearance of any object as seen by light which passes near a hot surface, as that of a boiler or a red-hot poker, is due to the convection of heat in the air, the warm current refracting light less than the cold air. See VENTILATION.

For the mechanical applications of heat, see STEAM-ENGINE, CALORIC-ENGINE, etc.

Sources of Heat.—They may be, so far as we know, ultimately reduced to two—chemical combination, and mechanical force; and, indeed, in all probability, the former is only a variety of the immensely different forms in which the latter is manifested. A more full examination of this point, and a general statement of the ultimate nature of the various sources of heat, will be found in the article FORCE above referred to. See also COMBUSTION, FUEL.

HEAT, *(ante.)*. The history of thermotics, the science of heat, from the earliest speculations to the most recent investigations, is full of interest. The ancients held notions in regard to it, which, although they lacked the precision which attends modern scientific investigation, were remarkable examples of the power of human reason to advance in the direction of truth unaided by anything except the inward light vouchsafed by the Creator. The medium of light and heat radiation, the cosmic or interstellar ether, which within the last century has been demonstrated to have an existence, was believed in by many of them. It was often the divine personification of cosmic material and also of force. In the Orphic hymns Æther is the soul of the universe and the author of all life. Anaxagoras, who taught that the sun was an inanimate fiery mass and not a deity, considered Æther to be the principle of fire or heat, and a half a century later Democritus, born about 460 B.C., taught that heat was produced by the efflux of extremely minute particles of matter, and moving with such velocity as to penetrate solid bodies; that some of these particles were infinitely small and from them the soul was formed. Plato had similar ideas, which may be found in his writings. Aristotle believed heat to be a condition of matter, and not a material substance, and his ideas were probably the first suggestions of a purely mechanical theory of heat. Twenty centuries later, Francis Bacon, 1561–1626, said in his *Novum Organum*, "Heat is a motion of expansion, not uniformly of the body together, but in the smaller parts of it; and at the same time checked, repelled, and beaten back, so that the body acquires a motion alternate, perpetually quivering, striving and struggling, and irritated by repercussion, whence springs the fury and fire of heat." Three-quarters of a century later, John Locke made a statement which approached still nearer the modern ideas on the subject. He says: "Heat is a very brisk agitation of the insensible parts of an object which produces in us that sensation from whence we denominate the object hot; so that what in our sensation is heat, in the object is nothing but motion." About the same

time, Huygens, in his *Tractatus de Lumine*, brought forward the undulatory theory of light, which contains many passages approaching much nearer than anything previously written, or for a century afterwards, to what may be called a scientific exposition of the laws of heat and light. He says: "It appears that light when gathered in the focus of a concave mirror, has the property of burning like fire, that is to say, it dissociates the particles of bodies, and this most certainly indicates motion, at least according to that philosophy wherein the causes of all natural effects are conceived by means of mechanical reasons." As a general statement of the doctrines of heat as a mode of motion this has not been put in much better words since his time. The doctrine of the actual convertibility of heat into mechanical force, which should stand as an equivalent, cannot be said to have been fairly started previous to the experiments of the American count Rumford. When at Munich superintending the manufacture of ordnance for the Bavarian government his mind was impressed with the great production of heat in boring cannon. By the use of a borer $\frac{5}{8}$ of an inch in diameter, applied with a pressure of 10,000 lbs. and a velocity of 32 revolutions per minute, sufficient heat was produced to raise 18 lbs of water from 60° to 212° F. in two hours and a half. The capacity of heat in the turnings having not changed, he concluded that the heat, whose source seemed to be inexhaustible, was the result of motion. Quantitative determinations, however, were necessary to demonstrate the correlations of heat and mechanical force, or heat and motion. These were furnished by the experiments of Dr. J. P. Joule of Manchester, England, and by Dr. J. R. Mayer of Hielbronn, Germany, which established what has been called the *mechanical equivalent of heat*. Joule's experiments were made in various ways. In one he employed paddle-wheels, which were made to revolve with a measured power in various liquids, whose specific gravities being known, the mechanical force could be compared with the amount of heat generated. Disks of metal were also revolved and forced against each other, the result in the evolution of heat being the same in all cases. He established the law which goes by the name of *Joule's equivalent*, or the *dynamical unit of heat*, viz.: that the fall of 772 lbs. through the space of one vertical foot affords a force sufficient to raise the temperature of water 1° F. In other words, the force given by the fall of 772 lbs. through one foot is equal to that generated by the elevation of 1 lb. of water 1° F. Dr. J. R. Mayer arrived at the same conclusions a year or two earlier by investigating the effects of the expansion and compression of gases, (see Mechanical Equivalent of Heat in *Correlation and Conservation of Forces*, N. Y., 1876. Boiling of Liquids, Diathermancy, Force, Rumford,) (*ante.*).

HEATH, *Erica*, a genus of small shrubs of the natural order *ericeæ* (q.v.), distinguished by a calyx of four leaves, a bell-shaped or ovate—often ventricose—corolla, and a 4-celled, 4-valved capsule, with dissepiments from the middle of the valves. The leaves are small, linear, and evergreen. The genus, as thus defined, has been broken down by some botanists into a number of genera, but the old name, *erica*, is still more commonly retained. The name heath, however, is, in popular language, extended to many plants of genera nearly allied to *erica;* and the little shrub which chiefly covers the large tracts named *moors* or *heaths* (Ger. *haide*) in Britain and on the continent of Europe is *calluna vulgaris*. The genus *calluna* has been separated from *erica*, chiefly on account of differences in the capsule, and of the presence of four bracts resembling an outer calyx. *C. vulgaris* the common Ling or Heather, is the only species known. It is found on arid places, and also in bogs. The flowers have much the appearance of being in spikes; they are of a lilac rose-color, rarely white. The various depth of color in the flowers of different plants adds much to the beauty of a hillside covered with heath in the end of Aug. The flowers afford abundance of honey, and bee-hives are therefore transported to the moors when the heather is in bloom. In bogs, it contributes much to the formation of peat. In some of the Hebrides, a decoction of heath is used for tanning leather. The plant is applied to various other uses in the Highlands of Scotland. Cottages are often thatched with it, and some of the poorest are mostly built of it, in layers with the roots inward, and mixed with earth and straw. Beds are also made of it, placed in a sloping direction, with the tops upwards, and are said to be very soft and elastic. Besoms and scrubbing-brushes are made of it. In the island of Islay, ale is made by brewing one part of malt and two of the young tops of heather; and this is supposed to be the same beverage which was anciently used by the Picts.—Of the genus *erica*, about 500 species are known; and these, with few exceptions, are natives of the s. of Africa. None are found in America. The British isles produce seven species, of which some have only been found in Ireland, and some in the s.w. of England, Cross-leaved Heath (*E. tetralix*) and Fine-leaved Heath (*E. cinerea*) are common plants in most parts of Britain, and like most of the genus, are very beautiful when in flower. The *heather-bells* of Scottish song are the flowers of one or both of these species. A sprig of *E. cinerea* was the badge of the Macdonalds at the time when they existed as a distinct clan. *E. Mediterranea* and *E. carnea*, common in the southern parts of Europe, are very frequent ornaments of British flower-borders, hardy plants, producing their flowers in great profusion in April. Many species, remarkable for the size and beauty of their flowers, are much cultivated in green-houses; and heath-houses are sometimes erected for the special purpose of their cultivation. Some of the south African or Cape heaths attain in their native region a much greater size than any European heath

except E. *arborea*, which in the Pyrenees sometimes grows to the height of twenty feet.

HEATH. The burning or setting fire maliciously to a heath in England is felony, and is punished by imprisonment for three years or less. The offense is technically called arson, being one of its varieties. In Scotland the offense is called muirburn (q.v).

HEATH, WILLIAM, 1737–1814; b. Mass. He commenced life as a farmer, but being fond of militia exercises he entered the ancient and honorable artillery company, occupying the position of chief officer in 1770. He was a representative in the provincial congress in 1774–75, and in 1776 was made a maj.gen. After the battle of Lexington he rendered good service in the pursuit of the British forces and in organizing the undisciplined men around Boston. He was in New York in 1776, and was one of the few officers who were opposed to evacuating the city. He continued in active and important service until the close of the war, when he went back to his farm. Afterwards he was state senator, probate judge, and was elected but declined the office of lieutenant-governor. His memoirs, written by himself, were published in 1798.

HEATHFIELD, Lord. See ELLIOTT, GEORGE AUGUSTUS.

HEATING. See WARMING and VENTILATION.

HEAVEN, in popular physical science, means the expanse which surrounds the earth, and which to a spectator on the earth's surface appears as a vast arch or vault, in which are seen the sun, moon, and stars. The earliest idea entertained of this expanse was of a solid vault or hemisphere with its concavity turned downwards (see FIRMAMENT).—In theology, the word "heaven" may be explained to mean that portion of the infinite space in which the Lord of all things, although present throughout all, is supposed to give more immediate manifestations of His glory. Of the belief in the existence of some such special scene of the presence of the Deity, most of the known religions of the world, ancient and modern, present abundant evidence. Aristotle declares that all men, whether Greeks or barbarians, have a conception of gods; and all agree in placing the habitation of the gods in the most elevated region of the universe. Plato is equally explicit. Even Epicurus teaches the same doctrine; and one of the treatises deciphered from the papyri of Herculaneum is a treatise by him, in which the position and the other characteristics of the habitation of the gods are minutely discussed. The same may be said of the Persian, the Egyptian, the German, the Scandinavian, and in general of all the ancient religions in which the belief of the existence of a supreme being assumes any other form than the pantheistic; and even in the pantheistic religions, although the philosophers may have adhered to the strict pantheistic view, and may have denied that any special locality could be regarded as the peculiar seat of the Deity, yet we find the popular belief and the popular worship even of such religions plainly founded upon the contrary supposition. In addition, however, to the idea of its being the special scene of God's glory, the word heaven also designates the place, or the state or condition, of the blessed spirits, and of the souls of just men who are admitted into the participation or the contemplation of the divine beatitude. In the religious system of the Greeks and Romans, none were supposed to be admitted to the heaven of the gods except the deified heroes or demigods; but with them the elysian fields of the lower world held, morally speaking, the same place in relation to the great doctrine of the divine retribution for the good and evil actions of human life. The elysium of the classic mythology is in all essential respects the natural equivalent of the heaven of the just. The Pythagorean doctrine of metempsychosis approached nearer to it in form, for it supposed that the soul, after the purification of successive transmigrations, was elevated to a higher and incorporeal condition in the cosmos. The doctrine of Plato was still more explicit. Although skepticism was rather the rule than the exception, it may be said in general that all the philosophical systems which included the belief of the immortality of the soul, also involved, at least in substance, the idea of a state of happiness as the reward of a virtuous life. The happiness, however, of the heaven of these various creeds differed widely from the spiritual delights of the heaven of revelation, each nation and each class forming to itself its own ideal of enjoyment. The delights of the classical elysium were, at all events in part, delights of sense. The German warrior had his war-horse and his armor laid in his grave, that he might be able to pursue, after death, the fierce enjoyments in which he had delighted while in the world of the living. The paradise of the Indian hunter is but a richer and more extensive hunting-ground. Still, not only these, but even the more groveling conceptions of the paradise of other races, must be regarded as a natural manifestation of the same instinct, or as a remnant, however overlaid by error and superstition, of the same primeval revelation upon which the scriptural notion of heaven is founded. Accommodating itself to the popular conceptions of the Jews, the biblical phraseology frequently implies the idea of the solid firmament already described; but the word, according to the common acceptation among Christians, is generally used simply to signify the abode of the Most High, and the special seat of His glory, in which the angels minister to Him, and the blessed spirits abide in perpetual praise and adoration. This abode of perfect bliss is believed to have been opened to the just after the

passion of our Lord and his ascension into heaven. Out of the just of the old dispensation, only Enoch and Elias were directly admitted to heaven; the patriarchs, the prophets, and in general the just, before the new dispensation, were detained in a preparatory abode, which the fathers call by the name *limbus patrum*, awaiting the coming of the common Redeemer. The common belief of Christians has been, that, since the coming of Christ, the just who are free from sin are admitted into heaven immediately after death. More than one controversy, however, has arisen on the subject; the most important of which are the Millenarian controversy (see MILLENNIUM), the Origenistic (see ORIGEN), and that on the question whether the just are admitted to the beatific vision of God immediately after death, or only after the general resurrection. The latter controversy arose out of the question as to the nature of the happiness of heaven, a discussion which would be out of place here. The Koran adopts the Cabalistic notion of seven heavens, which arise each above the other like the stages of a building; and it places the happiness of heaven in the enjoyments of sense. The Cabalistic writers divide these seven heavens according to the successive degrees of glory which they imply. The seventh is the abode of God and of the highest class of angels; the sixth, fifth, fourth, and third, are the successive abodes of the various grades of angels, arranged according to the degrees of dignity. The second is the region of the clouds, and the first the space between the clouds and the earth. One of the apocryphal books of the fifth c., *The Testament of the Twelve Patriarchs*, contains a very curious exposition of the same notion. See Fabricius, *Codd. Pseudep. Vet. Test.* i. p. 545.

HEBBEL, FRIEDRICH, a modern lyrical and dramatic poet of Germany, was b. at Wesselburen, in Ditmarsh, duchy of Holstein, Denmark, Mar. 18, 1813; studied at Heidelberg and Munich; and after traveling in France and Italy, settled at Vienna, where he married the actress Christine Enghaus in 1846. He died in 1863. His principal works are his *Gedichte* (2 vols. Hamb. 1842: Leip. 1848), remarkable both for their melody and beauty; and several dramas. Hebbel had a rich imagination, great power of thought, and an energetic and original style, but too great a predilection for the horrible and the exaggerated. His collected works appeared in 1865-68.—See Biography by Ruh (1877).

HE'BE, the goddess of youth, the daughter of Zeus and Here—according to others, of Here alone—was the wife of Hercules after he had been deified. She was the cupbearer in Olympus, before Zeus conferred that office upon Ganymede (q.v.); but she always retained the power of restoring the aged to the bloom of youth and beauty. According to Apollodorus, she became the mother of two sons by Hercules—Alexiares and Aniketos. In Homer she always appears as a virgin. In Athens altars were erected to her conjointly with Hercules. In Rome she was worshiped under the name of Juventas, and a temple in her honor existed on the Capitoline hill at the time of Servius Tullius. Statues of Hebe are extremely rare; she is to be recognized only by the drinking-cup.

HEBEL, JOHANN PETER, 1760–1826; b. Germany; studied at Erlangen, and in 1791 was professor in the gymnasium at Carlsruhe. In 1805 he was a church counselor, and in 1819 a prelate. He wrote many poems in the Swabian dialect which became so popular that he was called "the Burns of Germany."

HEBER, REGINALD, an English poet, and second bishop of Calcutta, was b. at Malpas, Cheshire, April 21, 1783. In 1800 he entered at Brasenose college, Oxford; and three years after produced his prize-poem *Palestine*, the only prize-poem perhaps which holds a place in English literature. In 1804 he became a fellow of All Souls. In 1807 he was inducted into the family-living at Hodnet, and entered upon his parochial duties with great zeal. He was a frequent contributor to the *Quarterly Review*, his political views being those of a tory and high churchman. In the course of 1812 he published a volume of *Hymns*. He was appointed Bampton lecturer in 1815, and two years after he received a stall in St. Asaph cathedral. He edited the works of Jeremy Taylor in 1819, and in 1822 he was elected preacher of Lincoln's Inn. Shortly afterwards the vacant see of Calcutta was offered to him, and after much hesitation on account of his wife and child, it was accepted, and he embarked for India on June 16, 1823. On his arrival, he entered upon his duties with exemplary zeal: and in June, 1824, he began the visitation of his diocese. He spent about 11 months visiting stations in Upper Bengal and the n. of Bombay. From April to Aug., 1825, he remained at Bombay, and sailed from thence to Calcutta, where he arrived on Oct. 21. In Feb., 1826, he proceeded to Madras on a visit to the southern provinces. He reached Trichinopoly on April 1, and on the 3d, after confirming 15 natives, and bestowing on them the Episcopal benediction, he entered a cold bath, in which, half an hour afterwards, he was found dead. The journal which he kept during his tour of visitation was originally published in three octavo volumes, and was afterwards reprinted in two volumes in Murray's *Home and Colonial Library*. His life was published by his widow in two volumes (Lond. 1830).

As a poet, his fame rests upon *Palestine* and his *Hymns* (new edition published by Murray in 1869). They have not much force or depth, but they are pleasingly versified, and are illuminated by graceful fancy. As a poet, he will be remembered; but as the most learned and zealous of Indian bishops, he is mainly enshrined in the affections of his countrymen.—RICHARD HEBER, half-brother of the preceding, was b. in Westmin-

ster in 1773, and died in 1833. He was a famous bibliomaniac. Having succeeded to large estates by the death of his father in 1804, he was enabled to indulge his elegant hobby to the utmost. Dr. Dibdin estimated his collection in England at 105,000 vols., in addition to which he possessed many thousands of books on the continent, the whole having cost him £180,000.

HEBERDEN, WILLIAM, 1710–1801; an English physician. In 1724 he was sent to St. John's college, Cambridge, where he obtained a fellowship about 1730, became master of arts in 1732, and took his degree in physic in 1739. He remained at Cambridge about ten years longer as a practitioner of physic, and gave an annual course of lectures on materia medica. In 1746 he became a fellow of the royal college of physicians in London; and afterwards establishing himself in London, was elected fellow of the royal society in 1769, and was employed in extensive practice for 30 years. In 1778 he was made an honorary member of the royal society of medicine at Paris.

HE'BERT, JACQUES RÉNÉ, commonly known as *Père Duchesne,* one of the most profligate characters of the French revolution, was b. at Alençon, in the year 1755. At an early age he went to Paris, and became a servant in one of the small theaters, but was dismissed for embezzling money. He then entered the service of a physician, but was soon dismissed for the same fault. At the commencement of the revolution, a person of the name of Lemaire, under the title of *Le Père Duchesne,* published a small popular paper for the diffusion of constitutional principles among the people. The success of this paper induced the Jacobins to establish another of the same name, and Hebert was appointed editor; and knowing the tastes of the class of people he addressed, he displayed such an exaggeration of principles and cynicism of language as ruined the enterprise of his honest rival. In consequence of the events of Aug. 10, he became a member of the revolutionary council, and played a conspicuous part in the horrors of Sept. He and his associates, called Hébertists or *Enragés,* were likewise mainly instrumental in converting the church of Notre Dame into a temple of reason. He was at length obliged to give way before the party of Robespierre, and perished on the scaffold on Mar. 24, 1794.

HE'BREWS [Heb. *Ibri*—either from Abraham, who came "from the other side" of Euphrates (*Eber, Ibr*), or from Eber, the great-grandson of Shem, and one of Abraham's ancestors] is the distinctive name of that branch of the Semitic family which migrated from Mesopotamia into Palestine, thence went to Egypt, and, after a long period of bondage, re-conquered Palestine, and finally settled there. Divided, at a later period, into two distinct states, that of Judah and of Israel, they were singly overcome, and led into exile. A portion, chiefly consisting of descendants of Judah (Jehudah), returned, and founded a new empire. From that time forward, all the members of the Mosaic commonwealth were known by the name of Jehudim, corrupted into Jews. A continuous sketch of their entire history from the days of Abraham to our own, as well as a brief outline of their language and literature, will be found under JEWS.

HEBREWS, EPISTLE TO THE, one of the epistles of the New Testament. Much discussion has arisen both as to its *canonicity* and *authorship,* the absence of the customary superscription rendering it impossible to attain certainty in regard to the latter, and naturally enough tending to throw doubt on the former also. In reference to the first and more important of these points, the canonicity, the case stands as follows: The earliest post-apostolic writer, Clemens Romanus, quotes from it in the same way, as from the other books admittedly canonical. Justin Martyr, Pinytus (?), the Cretan bishop, the predecessors of Clemens Alexandrinus and Origen, and the framers of the Peshito version of the New Testament, accept it as authoritative; while the Gnostic heretics, Basilides and Marcion, are spoken of as distinctly rejecting it. No disbelief of its canonicity is expressed by any section of the orthodox church until after the middle of the 2d c.—though many writers are silent altogether about it—after which period, for the next two centuries, the Roman and north African churches reject its authority. Tertullian speaks of it as a good sort of apocryphal book; Cyprian does not include it in Paul's epistles; Irenæus, even while defending the divinity of Christ, declines to strengthen his argument, which he could very effectively have done, by borrowing armor from its stores; while the Muratorian Fragment on the Canon, Caius, Hippolytus and Victorinus of Pannonia, also leave it out of the Pauline epistles. During the 4th c., however, its authority again began to revive, and it was received by Hilary of Poitiers, Ambrose of Milan, and later by Jerome, who, though frequently too hasty in his conclusions, was certainly the most learned and accomplished of the Latin fathers. The immense authority of Augustine was thrown into the same scale; others soon followed, and in 416 A.D., a decretal of pope Innocent III. placed its canonicity beyond cavil. In modern times, cardinal Cajetan, the opponent of Luther, reopened the ancient controversy. He rejected the authority of the epistle. The great reformer did the same, affirming that it was the work of some disciple of Paul's, who had not been thoroughly grounded in his master's teaching, and had built his own "wood, hay, and stubble," upon the apostle's "gold, silver, and precious stones." This opinion, however, met with small approval, and has never been adopted by any Protestant church.—*Authorship.* As we have already said, the author of the epistle is unknown, but is commonly supposed to be St. Paul. This appears to have been the opinion of the Eastern church from

the first; but the Alexandrian fathers—the most critical and scholarly of the early Christian theologians—struck with the entire dissimilarity of style, phraseology, and mode of thought which it presents to the Pauline epistles, and which is abundantly manifest even in the English version, sought to fix its authorship on some other person, Luke being the favorite. Tertullian, again, states that, according to the traditional belief of the north African school, Barnabas was the author. The Roman church, down to the middle of the 4th c., contented itself with a negative position, denying its Pauline authorship. The opinion of the Alexandrian school may be said to have prevailed, viz., that though Pauline in essence, the epistle was not Pauline in form. Thus the matter remained till the time of Luther, who suggested Apollos as the likeliest author. Since then the great majority of scholars, including many of the orthodox, have denied the Pauline authorship.

Who were the "Hebrews" to whom the epistle was sent, is also a matter of doubt; but the preponderance of probability is very strongly on the side of the church at Jerusalem, composed of those who were "Hebrews of the Hebrews." The date of the epistle can only be inferred from its contents. It must have been *before* the destruction of Jerusalem (70 A.D.), because the overthrow of the temple is not alluded to, which would have been one of the strongest links in the chain of argument to prove the temporary nature of the old national faith.

The purpose of the writer of the epistle is apparently to encourage the Jewish Christians of Jerusalem—perhaps of all Palestine—to persevere in the profession of their faith. In their own "Holy land," and in the perpetual presence of services that time had hallowed, and which were associated with all that was glorious and dear in their national history, they were apt at times to look back with a melancholy yearning on the past, and thus were often tempted to apostatize from motives which they hardly dared to condemn. The writer, conscious, it would seem, of the existence of this feeling, opens up with bold unflinching eloquence the whole question of Judaism *versus* Christianity; exhibits the contrast between the two with sharp, incisive analysis, strips the former of all its accidental and superstitious attractions, and shows that what is really deep and valuable in it is its *prophetic* character; it is but the shadow of a "better hope," viz., "the hope of the gospel;" and the great fathers and heroes of Judaism, from Abel downward, illustrate the truth of this, for "these all died in faith, not having received the promises, but having seen them afar off." But so vital and strong was their faith, that it may almost be said to have put them in spiritual possession of the realities to which they looked forward, for "faith is the *substance* of things hoped for, the *evidence* of things not seen." Thus they were "Christians before Christianity," and now that the things which they hoped for had come, the Jewish believers ought not to be grieved at parting with the old national worship, however dear, for the new worship really embraced the substance of the old, and thus bestowed upon it its own immortality. Such is, in the main, the course of thought. The style of the epistle in several passages is richly rhetorical.

HEB'RIDES, the name applied in a general sense to all the islands on the w. coast of Scotland. They have been variously classified; but the most natural division seems to be into the Outer and Inner Hebrides. To the Outer belong Lewis, with Harris, North Uist, Benbecula, South Uist, Barra, Coll, and Tiree. The remote isle of St. Kilda might be associated with this external series. The principal of the Inner islands are Skye, Eigg, Mull, Iona, Staffa, Ulva, Lismore, Kerrera, Easdale, Colonsay, Jura, and Islay. Bute, the Cumbraes, and Arran, though lying in the firth of Clyde, are usually classed with the Hebrides. The whole are popularly spoken of as the Western isles, the term Hebrides being confined chiefly to literature.

The total number of the Hebrides is about 490 (which number includes every islet that affords sufficient pasturage to support one sheep), but of these not more than 120 are inhabited. The entire area is not accurately known, but has been estimated at upwards of 3,000 square miles, and the population, which is not increasing, was in 1871 about 100,000. Of the whole surface only about 200,000 acres are arable, the rest is in pasture-land of little value, and in morasses, peat-mosses, lakes, and barren sands and rocks. The scenery of Skye is grand and picturesque; Mull is noted for its lofty mountains, Jura for its peaks, and Arran for its high rugged hills. Islay and Bute are comparatively level and arable. Staffa is remarkable for its basaltic columns and great cavern. Iona derives interest from its ruins and historical associations. Politically, all the Hebridean isles are attached to Scotland, in the civil and ecclesiastical systems of which they participate. The counties among which they are distributed are those of Ross, Inverness, Argyle, and Bute. The principal Hebridean towns are Stornoway and Lewis, Portree in Skye, Tobermory in Mull, and Rothesay in Bute. Though situated on the mainland of Argyle, Oban is usually considered a town of the Hebrides, and along with Rothesay, is best known to tourists.

Enjoying the benefit of the Gulf stream (q.v.), the climate of the Hebrides is peculiarly mild. Snow seldom lies long on the sea-shores or low grounds, and in sheltered spots tender plants are not nipped by winter frosts. But if genial the climate is also humid. Drizzling rains are frequent, and mists often envelop the islands, or at least shroud the higher mountains from sight. With these drawbacks, the climate is pleasant

and healthful, and is recommended for certain classes of invalids. Partaking of the old Celtic character, the humbler class of natives for the most part speak Gaelic, but latterly, through educational efforts and otherwise, English has made extensive progress. As in the mainland portion of the Highlands, many large estates have passed from old families of note into the hands of opulent modern proprietors, by whom extensive improvements have been effected. The greatest improvement of all, however, and which deserves to be spoken of as the parent of all others, has been the work of a Glasgow firm, David Hutcheson & Co., by whom has been established an extraordinary system of steam-navigation in connection with the Hebrides calculated to develop the resources of the islands, and bring them, with the neighboring coast, within the sphere of trade and the reach of tourists. Originated by David Hutcheson, a person of singular energy and capacious views, the system of Hebridean steamers embraces several distinct lines of route in connection with Glasgow; and opening up remote tracts formerly reached only with extreme difficulty, may be said to be gradually altering the character of, and giving a new value to, the western Highlands and islands.

The Hebrides are the *Ebudæ* of Ptolemy, the *Hebudes* (of which the name Hebrides is merely a corruption, said to be the consequence of a misprint in a Parisian printing office) of Pliny, and the *Sudreyjar* (Southern Islands, as distinguished from *Orkneyjar*, Northern Islands), of the Norwegians. The latter epithet was Latinized into Sodorenses, and is still retained in the title "Bishop of Sodor and Man." The history of these islands forms an interesting episode in that of Scotland. According to the general account, the Hebrides were first colonized in the beginning of the 9th c. by emigrants from Norway, who had fled from the iron rule of Harald Haarfager (863–936); they naturally settled in the greatest numbers on the first land that was reached, viz., the Shetland and Orkney Isles and Outer Hebrides; but some wandered as far s. as the Isle of Man, colonizing as they went. The consequence of this was the total absorption of the Celtic into the Norse element in the northern islands, while southward the Celtic element asserted the predominance. This colony after a time threw off swarms, which settled on the n. and w. coasts of Scotland, Cumberland, and Westmoreland, and in all probability founded the Norwegian kingdoms of Dublin, Waterford, and Limerick; it also sent a colony to Iceland in 874. At last the settlers became so powerful as to be a source of annoyance to the mother-country, whereupon Harald Haarfager, about 870 A.D., fitted out a great expedition, and subdued the Hebrides and Man. They remained subject to Norway till 1266, three years after the battle of Largs, and were then transferred to Scotland. In 1346 one of the chiefs, named Macdonald, reduced the whole under his authority, and took the title of "Lord of the Isles;" but in 1540 they were finally annexed to the Scottish crown by James V. The Hebrides were ecclesiastically dependent on Norway as late as 1374, and prof. Munch argues that this relation lasted till 1472, when St. Andrews was made the seat of a metropolitan. The influx of the Norsemen has had here, as elsewhere, great influence over the nomenclature; many places and islands having lost their original Celtic designations.

The Hebrides have, from time to time, been visited by learned inquirers, among whom may be named Martin, sir Joseph Banks, Pennant, Dr. Samuel Johnson, and Dr. John Macculloch, who wrote a geological account of the islands (2 vols. 8vo. with a volume of plates, 4to. 1819). Scott's *Lord of the Isles* contributed materially to attach a popular interest to these islands, which, by the aid of Hutcheson's steam-fleet, are now within the compass of summer pleasure traveling. The more important islands of the Hebrides are described in separate articles. For the early history of the Hebrides consult *Chronica Regum Manniæ et Insularum*, edited from the MS. in the British museum, by P. A. Munch, prof. of history in the university of Christiania (Christiania, 1860).

HEBRIDES, NEW. See NEW HEBRIDES.

HE'BRON, one of the oldest cities in Palestine, belonging to the tribe of Judah, 21 m. S.S.W. of Jerusalem; it may even be regarded as one of the oldest in the world, for it was in existence in the time of Abraham, nearly 2,000 years before Christ. Hebron was anciently called Kirjatharba, i.e., city of Arba, from the progenitor of the *Anakim* (q.v.); at a later period it was the residence of king David, before he conquered Jerusalem; its subsequent history is unimportant.—The modern town is a poor place, inhabited by about 5,000 people, of whom about 50 families are Jews. It lies low down in a narrow and picturesque valley—the valley of Eschol, famous now, as of old, for its thick clustering grapes, its olives, and other fruits. The church erected by the empress Helena, the mother of Constantine, on the spot where Abraham is said to have been buried, has been converted into a mosque called *El-Haram*. The alleged tombs of the patriarch and of several members of his family are still shown. They are all richly hung with palls of green or red silk, which are renewed from time to time; but it is believed that the real tombs are in a "cave" below the building. The modern name of the town is *El-Khulîl* ("the friend," i.e., of God), in allusion to Abraham. About a mile from Hebron, rising solitarily in the midst of vineyards, beside a well of pure water, is one of the largest oak-trees in Palestine. It is 23 ft. in girth, and its foliage covers a space of about 90 ft. in diameter. Some say that this is the very tree beneath which Abraham pitched his tent; but this notion is untenable, for the tree itself gives

no evidence of such enormous antiquity; and, besides, Jerome speaks of Abraham's oak having disappeared about the time of Constantine.

HEBRUS. See MARITZA, *ante*.

HECATÆ'US, the son of Hegesander, famed as an historian and a geographer, flourished most probably about 500 B.C. There is great difference of opinion as to the time of his birth and of his death, but the best critics conclude that he was born about 550 B.C., and that he died about 476 B.C. He belonged to an ancient and wealthy family of Miletus, and was thus enabled to gratify his natural passion for knowledge and travel. He seems to have visited Greece, Thrace, the countries bordering on the Euxine, and many of the provinces of the Persian empire, with parts of Italy, Spain, and Africa. The results of his foreign travels and of his private studies were embodied in two great works—his *Tour of the World*, and his *Histories* or *Genealogies*. His geographical work was divided into two great portions, one treating of Europe, the other of Asia, Egypt, and Libya. He improved the map of the world which had been made by Anaximander. His *Histories* was little more than a prose version of the poetical legends of the Greeks—about Deucalion and his descendants—Heracles and the Heraclidæ—the Peloponnesian traditions—and those of Asia. Herodotus seems to have set considerable value on the writings of Hecatæus. The fragments of the works of Hecatæus have been edited by Creuzer, Klausen, and others.

But the most interesting part of the life of Hecatæus is that which succeeded his travels. In the revolt of the Ionians against Persia, his extensive knowledge of the Persian empire and its resources enabled him to give sound advice to Aristagoras, the ringleader of the insurrection, which, however, was rejected. He dissuaded his countrymen from an attempt so far above their means; when that counsel was despised, he urged the formation of a fleet, but without effect. After defeat had humbled the Ionians, and Aristagoras, with others, contemplated flight to Sardinia, he wished them (though in vain) to fortify the island of Leros, and wait there the course of events. He afterwards went as ambassador to the Persian satrap Artaphernes, and induced him to treat the Ionians with leniency.

HEC'ATÉ, an ancient Thracian goddess, afterwards adopted into the Greek pantheon, is first mentioned by Hesiod, who calls her the daughter of the Titan Perses, and of Asteria, or night. She was the only one of the Titans, under the rule of Zeus, who retained her former power. She appears on some occasions as the bestower of wealth, victory, wisdom, good-luck to sailors and hunters, and prosperity to youth, but able also to withhold these blessings. In connection with Persephone, she is described as a powerful infernal and cruel deity, who has all the magic powers of heaven, earth, and sea at her command. Particular honors were paid to her in Bœotia, at Ægina, and even in the Eleusinian mysteries. She played an important part in the mysteries of the Cabiri, which were celebrated principally at Samothrace and Lemnos. Her sanctuary in Samothrace was the Zerynthian cave, and wherever she was worshiped along with the Cabiri, her temple was placed near a cave. As the bestower of good and averter of evil, her image was placed before the houses of persons of rank, in places of popular assembly, and at crossways, where at every new moon offerings of food were presented to her, which were consumed by poor people. As an infernal goddess, she appears in a hideous form. Serpents issue from her feet, serpents are twined in her hair, she bears a lighted torch and a sword in her hand, and two black shaggy dogs are her attendants; and sometimes she is represented with three heads, viz., those of a horse, a lion, and a dog. In this last form she appears at the crossways. There is another important feature, which arose from the notion of her being an infernal divinity, viz., the belief in her being a spectral being, who at night sent from the lower world all kinds of demons and terrible phantoms, who taught sorcery and witchcraft, and dwelt at cross-roads, tombs, and near places where murder had been committed.

HEC'ATOMB (Gr. *hecaton* and *bous*), in the worship of the Greeks, and in other ancient religions, means a sacrifice of a large number of victims, properly, although by no means necessarily, one hundred. Originally, it would seem that the practice was to burn the entire victim; but even as early as the time of Homer, it was usual only to burn the legs wrapped up in the fat and certain parts of the intestines. The rest of the victim was consumed at the festive meal which succeeded the sacrifice. Besides, therefore, that the gods were believed to be propitiated in proportion to the number of victims, the increase of the number was also gratifying, not alone to the priests and servants of the temple, but also to the public, who were admitted to the sacrificial banquet. Hence in Athens the hecatomb was a most popular form of sacrifice (Athenæus, i. p. 3). On the contrary, the thrifty Spartans limited the number both of the victims and of the sacrifices; and while the other Greek states required that the victim should be of the most perfect kind, the Spartans were content with animals of a very inferior character. In the hecatomb, strictly so called, the sacrifice was supposed to consist of one hundred bulls; but other animals were frequently substituted.

HECK, BARBARA, 1734-1804; b. Ireland, of German parents, in a district which early felt the influence of Wesley's preaching. She and her husband Paul came to America with Philip Embury in 1760, and in 1766 they organized a Methodist society

in Embury's house in New York city. This led to the famous old John street Methodist chapel. With Embury she was instrumental in founding other societies in northern New York and Canada.

HECKER, FRIEDRICH KARL FRANZ, a leader of the democratic party in the German revolution of 1848, was b. at Eichtersheim, Baden, Sept. 28, 1811, and after studying law in Heidelberg, became in 1838 advocate of the supreme court in Mannheim. Though rising to eminence as a pleader, when elected in 1842 a member of the second chamber in Baden, he abandoned his profession for political life, and soon grew popular among the more advanced sections of the opposition. In 1846 he began to side actively with the purely democratic and socialistic party outside of the chamber, and on the revolution breaking out in 1848, immediately began to employ his eloquence in revolutionary agitation. When the preliminary convention (*das vorparlament*) met, he endeavored, with the influence of his whole party, to constitute it into a permanent republican assembly. The frustration of this effort led him to think of surprising the smaller governments of southern Germany with the artisan bands which had been sent to the Rhine. Defeated at Kandern, April 20, 1849, he fled into the canton of Basel, where he conducted a newspaper against the constitutional party. On being refused admission into the parliament, though elected to represent Thiengen, he emigrated to America, where he had bought a farm. The Baden revolution (1849) brought him back to Europe, but finding the revolution over on arrival, he returned to America. He took an active part in the war of secession.

HECKER, ISAAC THOMAS, b. N. Y., 1819. About 1843 he became interested in socialistic communities at Brook farm and at Fruitlands, Mass. In 1845 he joined the Roman Catholic church, and in 1849 (in England) was ordained a priest. He joined the Redemptorists, but with others was released from his vows, and founded the congregation of St. Paul the apostle, or Paulists. In 1865 he established in New York *The Catholic World*. He was present, as procurator of bishop Rosecrans, at the Vatican council in 1869, and in 1873 traveled extensively in Europe and the east. He is the author of *Questions of the Soul*, and *Aspirations of Nature*.

HECKEWELDER, JOHN, 1743–1823, b. England, accompanied his parents at 12 years of age to Pennsylvania, and in 1771 became a Moravian missionary among the Indian tribes along the Ohio. After laboring 40 years he retired and passed the remainder of his life at the Moravian village of Bethlehem, Penn. He wrote a valuable *History of the Manners and Customs of the Indian Nations*, and a narrative of his missionary work.

HECKLES, or HACKLES, and **GILLS**. These are very important parts of various machines, employed in the preparation of animal and vegetable fibers for spinning. They consist of a series of long metallic teeth, through which the material is drawn, so that the fibers may be combed out straight, and so fitted for the subsequent operations. The manufacture of heckles and gills involves great care and nicety, as any imperfection may cause great loss, by damaging the fiber which passes through them. For flax, hemp, jute, and similar large and coarse fibers, the teeth of the heckles are large, being about eight inches long, and made of steel wire one-fourth of an inch in diameter. This is gradually reduced from the base upwards, until it ends in a fine point. The whole is beautifully polished, so as to prevent injurious friction. They are fixed in a wooden or metallic base, in several rows, alternating with each other at short distances apart, in heckles; but in gills the teeth are much finer, resembling needles, and fewer in number, being placed usually in two rows; they constitute a part of the spinning machinery. The manufacture of these articles is a special trade; the manufacturers are called heckmakers.

HECKMONDWIKE, a thriving manufacturing village of England, in the West Riding of Yorkshire, is situated on the Lancashire and Yorkshire railway, 3 m. n.w. of Dewsbury, and 10 m. s.w. of Leeds. It is the chief seat of the carpet and blanket trades in the West Riding. Pop, '71, 8,300.

HEC'LA, or HEKLA, a volcanic mountain in Iceland, is of a conical shape, and stands isolated about 20 m. from the s.w. coast. Its snow-clad summit is 5,110 ft. high. The principal crater, when visited by sir George Mackenzie, was about 100 ft. deep, and contained a large quantity of snow in the bottom. There are many small secondary craters near the summit. The sides of the mountain are broken by numerous deep ravines, forming channels for mountain torrents that are produced by the melting of the snow. The principal rocks are lava and basalt, covered with the loose stones, scoriæ, and ashes ejected from the volcano. The view from the summit is very desolate and wild. "Fantastic groups of hills, craters, and lava, leading the eye to distant snow-covered jokuls; the mist rising from a waterfall; lakes embosomed amid bare, bleak mountains; an awful and profound slumber; lowering clouds; marks all around of the furious action of the most destructive of the elements, give to the region a character of desolation scarcely to be paralleled."

A record of the eruptions has been kept since the 10th century. They are few in number, only 43, but they have been always very violent, and generally continuing for a considerable time. One of the most tremendous occurred in 1783, when the immense

quantity of lava and ashes ejected laid waste a large extent of country. The internal fire remained, as if exhausted, in a quiescent state till Sept., 1845, when with terrific energy it again burst forth, and continued active for more than a year. At this time it poured out a torrent of lava, which at the distance of two miles from the crater was one mile wide, and from 40 to 50 ft. deep. A fine dust from this eruption was scattered over the Orkney islands, a distance of 400 miles from Hecla.

HECTARE. See ARE. *ante* METRIC SYSTEM.

HEC'TIC FEVER (Gr. *hektikos*, habitual), (see FEVER). a peculiar type of feverish disease, usually found associated with organic disease of the chest or abdomen, and above all with tubercular disease, or consumption (q.v.). It can scarcely be called an independent form of disease, although carefully described as such by most of the older authors, and distinguished as a fever with morning and evening paroxysms, and intermediate remissions. Generally speaking, the evening paroxysm is the more marked; the patient becomes flushed after eating, or in the excitement of conversation; there is a preternatural vividness of expression, which, with the heightened color, sometimes gives a very fallacious impression of health. The patient retires to bed, has tossing and uneasy sleep, and wakens in the middle of the night, or towards early morning, bathed in cold perspiration, and in a state of extreme languor. Next day, the whole of these changes are repeated, and under the slow but too sure progress of the fever, the patient gradually emaciates, and in the end dies exhausted. The treatment of hectic fever is substantially that of consumption (q.v.).

HECTOGRAM. See METRIC SYSTEM.

HECTOLITER. See METRIC SYSTEM.

HECTOMETER. See METRIC SYSTEM.

HECTOR, the bravest hero in the Trojan army, was the son of king Priam and Hecuba, and married Andromache, the daughter of Eëtion, king of Thebes, in Cilicia, by whom he became the father of Astyanax of Scamandrius, and, as some say, likewise of Laodamas. His exploits are sung by Homer in the *Iliad*. Hector having slain Patroclus, the friend of Achilles, the latter, forgetting his quarrel with Agamemnon, took up arms to avenge his beloved companion, and Hector fell by his hand. His body was dragged in triumph by the conqueror round the tomb of Patroclus, but was afterwards ransomed by Priam, who caused it to buried with great pomp. In Ilium, Hector was honored as a hero, and sacrifices were offered to him. In compliance with an oracle, his bones are said to have been subsequently conveyed to Thebes, in Bœotia. Hector is incontestably the greatest hero in the *Iliad*. Yielding in valor to none, he is defeated by Achilles, not because the latter surpasses him in courage, but because, already wounded and exhausted with prolonged conflicts, he undertakes a single combat, trusting to the aid of Deiphobus. Minerva assumes the form of the latter, and Hector is deceived and forsaken. In humanity, he is superior to all. One of the most beautiful episodes in the *Iliad* is that in which Hector takes leave of his wife Andromache, and expresses his feelings as a husband, a father, and a prince.

HEC'UBA (Gr. *Hekăbe*), the second wife of Priam, king of Troy. During the Trojan war, she witnessed the destruction of all her sons, with the exception of Helenus, and at last saw her husband murdered before her eyes by the savage Pyrrhus. After the destruction of Troy, she fell into the hands of the Greeks as a slave, and, according to one form of the legend, threw herself in despair into the sea. Euripides (in his tragedy of *Hecabe*) and other ancient tragedians describe her as a tender mother, a noble princess, and a virtuous wife, exposed by fate to the most cruel sufferings. In sculpture she is represented as a matron, whose face, furrowed by grief, betrays a character naturally ardent and passionate.

HEDDING, ELIJAH, D.D., 1780–1852; b. N. Y. At the the age of 18 he joined the Methodist church and begun work as an itinerant preacher in Vermont and Canada. In 1803 he was sent to New Hampshire, and in 1807–9 was presiding elder of the New Hampshire and New London districts. From 1809 to 1824 he preached chiefly in Massachusetts. In the latter year he was chosen bishop, and in 1848 represented the church in the British conference. He was one of the founders of *Zion's Herald*, the first Methodist paper in the country. His *Manual of Discipline* is highly valued.

HEDGE (Sax. *hege*, Ger. *hag*, Fr. *haie*; in Ger., *hegen* is to fence, protect, cherish), a fence formed generally of growing shrubs. Hedges are very much used in some parts of the world, whilst others, equally cultivated, are almost destitute of them. Thus, whilst they are very common in many parts of Britain and of Italy, they are comparatively rare in France and Germany. For many situations, they are particularly adapted, owing to the protection which they afford from high winds; and the height to which they are permitted to grow ought to be accommodated to the requirements of the locality in this respect. They are also much more pleasant to the eye than dry stone walls or coarse palings; but there can be no doubt that where neither shelter nor ornament is intended, they cause great waste of land; as even when very trimly kept, they occupy a much more considerable breadth than other fences, and their roots draw nutriment from the soil on each side to a very considerable distance. It has been calculated that

even such reduction of the breadth occupied by hedges as might be accomplished by moderate care in trimming, would add to the extent of land available for crops in England as much as a middling-sized county.

Hedges in Britain are generally formed of hawthorn (q.v.). The unsightly blanks in hawthorn-hedges, which are also injurious to their usefulness, are not easily filled up with hawthorn-plants, but in such circumstances, the barberry grows well, and is sometimes used with great advantage. Hedges are also sometimes formed of barberry itself. See BARBERRY. Beech-hedges are very common around gardens and pleasure-grounds, and a hedge of beech and hawthorn mixed is common in many places. Beech-hedges, closely trimmed, can be made almost as impervious as any kind of hedge known in Britain; and where shelter is needed, can easily be trained to a height of twenty feet or upwards. Holly makes an excellent, ornamental hedge, much in use for gardens and pleasure-grounds. Ornamental hedges are sometimes formed of yew, hornbeam, lime, and other trees, which can scarcely, however, be reckoned among hedge-plants. Privet is much used for ornamental hedges, but they are of little use as fences.

Hedges were in use among the ancient Romans, chiefly for the inclosure of vineyards and gardens. It is probable that they have existed in England since the times of the Romans, although not very common till the end of the 17th c.; but they are supposed to have been first introduced into Scotland and Ireland by the officers of Cromwell's armies. The first hedges planted in Scotland are said to have been at Inch-Buckling Brae, in East Lothian, and at the head of loch Tay, and that at the former place existed as a row of old hawthorns in the beginning of the present century.

HEDGE, FREDERICK HENRY, D.D., b. Mass., 1805; son of Levi, the professor of logic and metaphysics in Harvard college. In 1818 he accompanied George Bancroft to Germany, where he studied nearly five years. He returned in 1823, and two years later graduated at Harvard. The next three years were passed in the study of theology, and in 1828 he was settled in the Unitarian ministry at West Cambridge. Afterwards, he was pastor at Bangor, Me.; Providence, R.I.; and Brookline, Mass. He traveled in Europe in 1847–48. In 1857 he was made professor of ecclesiastical history in the Cambridge theological school. In the same year he edited the *Christian Examiner*, a Unitarian journal, and in 1859 was president of the American Unitarian association. In 1872 he was appointed professor of German in Harvard college, where he now remains. He has published *The Prose Writers of Germany; Liturgy for the use of the Church; Reason in Religion; Primeval World of Hebrew Tradition;* and many translations from German poets.

HEDGEBOTE, in English law, means the right of a tenant to cut wood on the farm or land, to repair the hedges or fences.

HEDGEHOG, *Erinaceus*, a genus of insectivorous quadrupeds, the type of the family *erinaceidæ*. The muzzle is rather elongated, the neck short, the limbs short, the feet five-toed, the claws strong, the tail short, the body covered on the upper parts with sharp spines and with hair below, and capable of being rolled up into a ball by means of a powerful muscle extended under the skin. The teeth are 36 in number, 20 in the upper jaw and 16 in the lower, but considerable difference of opinion has existed among naturalists as to the character of some of them. The middle incisors are very long, and stand forward; those of the upper jaw are widely separated; the lateral ones small. Like many other *insectivora*, hedgehogs are by no means limited to insect food, but prey on larger animals, as reptiles, small quadrupeds, and birds; they are fond of eggs and of milk, and in confinement will readily eat soaked bread, cooked vegetables, or porridge. Their power of rolling themselves into a ball, from which the spines project on every side, is their means of protection from enemies. The spines are curiously bent near the root, and so set, that on the contraction of the muscle by which the animal rolls itself up, they are held firmly in their position, their points towards the adversary. They are very strong and sharp; their elasticity is also so very great, that the animal can sustain falls from great heights without apparent injury.

The COMMON HEDGEHOG (*E. Europæus*) is a native of Britain and of most parts of Europe. A particular description is unnecessary. Its short ears are one of its distinctive specific characters. It is seldom above 9½ in. in length. Its spines are about an inch long. It readily kills snakes, and even vipers, which it eats, beginning always at the tail. It is said to be capable of resisting in an extraordinary degree not only the venom of serpents, but other kinds of poison, however administered. A hedgehog has been known to eat great numbers of cantharides (Spanish flies) without injury, although one would have caused great agony to a dog. It brings forth from two to four young at a birth, and provides for the occasion a curiously constructed nest, of which the roof is capable of throwing off the rain, so as to keep them dry. The young are blind at first; their ears are also closed—a thing as unusual as the former is common among animals—their bodies are covered with soft incipient spines. In winter the hedgehog becomes torpid, retiring to some hole at the base of a tree, beneath roots, or in some such situation. It provides no winter store, and no other British animal hibernates so completely.—The hedgehog is easily tamed, becomes very familiar, and is very useful in houses where *black beetles* are troublesome. Night is its period of activity.—The flesh of the hedgehog is eaten in some parts of Europe, but in Britain only by gypsies, who

roll it up in a ball of clay, and so roast it.—Other species of hedgehogs are found in different parts of Asia and Africa.

HEDGEHOG PLANT, a name given to those species of medick (*medicago*) which have the pods spirally twisted and rolled up into a ball, beset with spines. The peculiar appearance of the pods makes them objects of interest, on which account they sometimes find a place on flower-borders: and like the other medicks (q.v.) they are useful in the countries in which they abound, as affording excellent food for sheep and cattle. They are particularly plentiful on sandy grounds near the sea in some parts of South America, and their pods are too plentiful in the South American wool imported into Britain.

HEDGE-MUSTARD, *Sisymbrium*, a genus of plants of the natural order *cruciferæ*, mostly annual or perennial herbaceous plants, with very various foliage, some yellow or white flowers, and a long roundish or 6-angled pod (silique). Several species are natives of Britain, of which one, the COMMON H. (*S. officinale*), was once employed in medicine for catarrhs and other ailments. It is said to be diaphoretic and expectorant. It has a mild pungency. It is sometimes cultivated as a pot-herb. It is an annual plant, plentiful in waste places and by waysides, sometimes 2 ft. high, branched, with runcinate or deeply-lobed leaves, stem and leaves hairy, flowers very small and yellow. The pods are erect, and closely pressed to the stalk.—BROAD-LEAVED H., or LONDON ROCKET (*S. irio*), is said to have sprung up in great abundance on the ground desolated by the fire of London in 1666.—FINE-LEAVED H., or FLIX-WEED (*S. Sophia*), is common in many parts of England and Scotland, growing in waste places. Its leaves are doubly or trebly pinnatifid. It is about 2 ft. high, branched, with yellow flowers. It was formerly administered in dysentery and hysteria, and the seeds as a vermifuge.

HEDGE-SPARROW, HEDGE-WARBLER, HEDGE-ACCENTOR, or DUNNOCK, *Accentor modularis*, a little bird of the family *sylviadæ*, a common native of Britain and of most parts of Europe. It is not quite so large as the house-sparrow, which it somewhat resembles in dull brownish plumage, but, notwithstanding its most common name, in little else; its slenderness of bill, and its whole form, proclaiming it at once to be of a different family. It feeds principally on insects. It is one of the earliest spring songsters, having a sweet plaintive song; and the nest is one of the first that the school-boy finds in spring. The nest, of green moss, roots, and wool, lined with hair, is usually placed rather low in a bush or hedge. The eggs are four or five in number, of a delicate and spotless bluish green. The cuckoo very often lays its egg in the hedge-sparrow's nest. The hedge-sparrow is chiefly found in summer, in the northern temperate parts of Europe, migrating southward in winter; but in Britain it remains all the year. —Another species of the same genus, the ALPINE WARBLER, or ALPINE ACCENTOR (*A. Alpinus*), a rather larger bird, lighter and rather more varied in color, has in a few instances been found in Britain. It is common in the Alps, and other mountains of France, Germany, and Italy.—Other species of accentor are found both in the Old and New World. They are all of dull plumage. In this genus the bill is more conical than in the other *sylviadæ*.

HEDJAZ (the land of pilgrimage), a maritime province of Arabia, extending along the eastern shore of the Red sea, and bounded on the n. by the Syrian desert and the gulf of Akaba, on the e. by the province of Nedjed, and on the s. by that of Yemen. It is almost entirely unproductive, being chiefly sandy or stony. Containing the two sacred cities, Mecca and Medina—the former the birthplace of Mohammed, the latter the place in which he is interred—Hedjaz is the "holy land" of Arabia. It is traversed annually by vast numbers of pilgrims.

HEDJRAH (*Hegirah*), or, more fully, HEDJRAT AL-NABI, Arab. emigration (not *flight*, as commonly translated) of Mohammed (q.v.). The tribe of the Koreish having resolved to slay the new prophet, their kinsman, he secretly left Mecca on Sept. 13, 622 A.D., and repaired to Medina, where, partly from a feeling of jealousy towards Mecca, partly because his new doctrine had already found here many new adherents, he was so well received and so vigorously supported in the wars which he now began to wage against his adversaries, that the rise and progress of Mohammedanism was said to date in reality from the time of Mohammed's leaving Mecca. The Hedjrah, therefore, was made the starting-point of a new era—the Mohammedan (Tarikh Alhijrah)—by Caliph Omar, who, 639 or 640, with the aid of a Persian, Harmozan, instituted the new Moslem calendar. It does not, however, as is generally supposed, begin from the day of the flight itself, but from the first of the Moharram (the first month of the year) preceding it—a date corresponding to our July 15 or 16, 622 A.D.

The Mohammedan year, as a lunar year, is shorter than ours by 10 days 21 hours and $14\frac{3}{5}$ seconds; and this circumstance renders the exact transfer of Mohammedan dates into dates of our own calendar a very difficult task. An elaborate method has been invented for that purpose by Ideler; an easy, although not minutely accurate way of finding the year, but not the month and the day, is by the deduction of 3 per cent from the given Mohammedan year, and the addition of 622 to the sum so obtained; e.g., the year of the Hedjrah corresponding to 1862 A.D. being 1279, deduct 3 per cent, or about 39 = 1240, add 622 = 1862.

HEEM, JAN DAVID DE, the most celebrated painter of what is called "still-life" that the Dutch school has produced, was b. at Utrecht in 1600, studied under his father, and soon obtained immense sums for his pictures. Towards the close of his life he removed to Antwerp, where he died in 1674. Heem's pictures represent, for the most part, splendid vases of fruits and flowers, musical instruments, and ornaments of various kinds. He painted a garland of flowers for a certain Jan Vander Meer, who refused 2000 guilders for it, but afterwards gave it to the Prince of Orange, who brought it with him to England. Heem's coloring is exquisite, and his use of *chiaroscuro* unsurpassable.

HEEN, CHOW, TING, AND **FOO,** Chinese geographical terms, used to designate the relative rank of cities and districts. *Heen* indicates the smallest division, although its city may be an important one; thus, Shanghai-heen is a large city and district, while the department in which it is situated, Sungkiang-*foo*, to which it is subordinate, is a smaller place. Generally speaking, however, the terms designate the rank of cities, from *foo*, the chief, to *heen*, the least in size.

HEEREN, ARNOLD HERMANN LUDWIG, an eminent German scholar, was b. Oct. 25, 1760, at Arbergen, near Bremen, where his father was at that time pastor, and received his education at the cathedral school of Bremen, and at the university of Göttingen. He first made himself known to the literary world by two philological works—viz., an edition of Menander's *De Encomiis* (Göttingen, 1785), and the *Eclogæ Physicæ et Ethicæ* of Stobaeus (4 vols. Göttingen, 1792–1801). In preparing materials for the latter of these works, he visited Italy, the Netherlands, and France, and by intercourse with various learned men of these countries, expanded and enriched his mind. In 1794 he was appointed professor of philosophy, and in 1801, professor of history at Göttingen. He married in 1797 a daughter of Heyne, and died Mar. 7, 1842. His lectures in the university referred, from the very first, more to Greek and Roman antiquities, and to the history of the fine arts, than to philology, strictly so called. The latter, indeed, was finally quite thrown into the background. In 1793–96 appeared at Göttingen his *Ideen über Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt* (4th edit. 5 vols. 1824–26). This work has secured him a place among the most eminent modern historians. If his *Geschichte des Studiums der classichen Literatur seit dem Wiederaufleben der Wissenschaften* (2 vols. Gött. 1797–1802) proved less satisfactory to scholars, his *Geschichte der Staaten des Alterthums* (Gött. 1799; 5th edit. 1826), and his *Geschichte des Europ. Staatensystems und seiner Colonien* (Gött. 1809; 4th edit. 1822) abounded in new views and acute expositions. For his *Untersuchungen über die Kreuzzüge*, he received the prize from the National institute of France. His *Kleine historische Schriften* (3 vols. Gött. 1803–08) contain some very interesting treatises. In 1821–26 he published an edition of all his historical works (*Historischen Werke*) in 15 vols. Heeren was a member of the academies of St. Petersburg, Berlin, Munich, Stockholm, Dublin, and Copenhagen, and of the Asiatic societies of London and Calcutta.

HEFELE, KARL JOSEPH VON, D.D., b. Würtemberg 1809; graduated at Tübingen, and in 1840 received a professorship in the Catholic theological faculty, where he represented the departments of church history, Christian archæology, and patrology. In 1838 he became doctor of divinity, and afterwards knight of the order of the Würtemberg crown. From 1842 to 1845 he was a member of the Würtemberg chamber of deputies. He was consecrated bishop of Rottenberg in 1869, and took part in the Vatican council. In 1874 he declined the archbishopric of Freiburg offered to him by the Baden government on the ground that he could not take the oath which was demanded from the bishops in Prussia and Baden. His most important work of research is the *History of Councils*, based on the study of original materials. It has been translated into English under the title of *A History of the Christian Councils, from the Original Documents, to the close of the Council of Nicæa*, A.D. 325. Among other works are *The Introduction of Christianity into South-Western Germany, Cardinal Ximenes and the Ecclesiastical Condition of Spain in the Fifteenth Century*, and *Contributions to Church History, Archæology, and Liturgy*. He has also published a *Selection of the Homilies of Chrysostom* in a German translation, and an edition of the works of the apostolic fathers. An English translation by the Rev. Canon Dalton, of his *Life of Ximenes*, appeared in 1860.

HEGEL, GEORG WILHELM FRIEDRICH, one of the greatest German philosophers, was b. Aug. 27, 1770, at Stuttgart, and became, in 1788, a student in the Tübingen theological institute, where his speculative abilities, however, were outshone by his younger companion, Schelling. After leaving the university in 1793, he was a family tutor at Bern and Frankfort-on-the-Main for six years, during which period he devoted himself chiefly to the study of Christ's life and the philosophy of religion. In the beginning of 1801 he left Frankfort for Jena, where he published his first work, *Ueber d. Differenz d. Fichte'schen u. Schelling'schen Systems* (1801), and entered the university as *privat-docent*. Next year, he joined Schelling, to whose philosophy he seems at this time to have adhered, in the editorship of *Das Kritische Journal für Philosophie*. His lectures in Jena did not attract much notice, but it was at this place, while the din of the battle in 1806 was sounding through the town, that he completed his first important work, *Die Phänomenologie d. Geistes* (1807), which he used afterwards to call his voyage of discovery. Shortly before the battle, he had been made extraordinary professor of

philosophy; but the disaster which that event brought upon Jena compelled him to seek means of subsistence elsewhere, and he went, accordingly, at Niethammer's request, to Bamberg, where he edited a political paper for two years. In 1808 he was appointed rector of the gymnasium at Nuremberg, and there he had just completed his *Wissenschaft d. Logik* (3 Bde. 1812–16), when he was called in 1816 to a professorship of philosophy in Heidelberg, where he published his *Encyklopädie d. philosophischen Wissenchaften* (1817; 3te Aufl. 1830), in which he first developed his complete system. In 1818, however, he was called to Fichte's place in Berlin, and it was here that he first began to gather around him a new philosophical school. His lectures, which were delivered in a stammering voice, and without rhetorical ornament, yet with the impressiveness of being the expression of laborious thought, attracted hearers from all ranks and professions. He rose to considerable political influence through his official connection with the Prussian government, and his philosophy in some respects lost credit from the generally conservative tendencies of his administration. Still, in his *Rechtsphilosophie* (1821), he demands representation of the people, freedom of the press, publicity of judicial proceedings, trial by jury, and the administrative independence of corporations. In the midst of an active life he was suddenly cut off by cholera, Nov. 14, 1831, and buried beside Fichte. A complete collection of his works was published in 18 vols. (Berlin, 1832–41), and his life written by Rosenkranz (1844).

At first, as has been intimated, Hegel's philosophy started from the same position as Schelling's—the principle of the identity of knowing and being; but at an early period he departed from Schelling's theory, that this identity can be apprehended only through an intellectual intuition, of which the understanding can render no account. Carrying out rigorously the principle from which both started, as embodied in the proposition of Spinoza, that the order and connection of thoughts are the same as the order and connection of things, Hegel sought to find the universal form which characterizes the process both of existence and thought. This universal form he recognized as the process of becoming (*Werden*). But the process of becoming is only the union of position and negation; for all that becomes at once posits, and, by passing into something else, removes itself. Identical with this process is the process of thought; for every thought involves its contradictory. But the contradictory is not a mere negation; it is in itself positive; the conception of unity, e.g., is not more positive than its contradictory, the conception of plurality. Every thought therefore, as it involves its contradictory, adds to its own contents, and by the combination of the two contradictories, we rise to absolute knowledge. This process, involving in it the three stages of position, negation, and the union of both, determines the method of Hegel; for according to this method, his entire system is organically necessitated in all its parts to a threefold division corresponding to the three stages in the process of thought and existence. The point from which all knowledge must start is thought simply and in itself, the science of which, logic forms, therefore, the first part of this system. But thought passes into something other than itself, exists out of itself in nature, and the philosophy of nature accordingly ranks as the second part. Returning again from its estrangement in nature, thought becomes conscious of itself in mind, and consequently the philosophy of mind forms the third part. It would be profitless to give a mere enumeration—and nothing more could be attempted here—of the various subdivisions, in their degrees of subordination, into which these three grand divisions are separated. For an account of the system, consult, besides the ordinary histories of philosophy, Vera's *Introduction à la Philosophie de Hegel* (Paris, 1855), and Haym's *Hegel u. seine Zeit* (Berlin, 1858). For the English student of Hegel, Dr. Hutchison Stirling's *Secret of Hegel* is invaluable.

Hegelianism is commonly employed to denote the direction of philosophical speculation in the large school which arose under the influence of Hegel. During Hegel's life, and on till 1841, when Schelling came to Berlin, Hegelianism found a very efficient organ in the *Jahrbücher für wissenschaftliche Kritik* (1827–47, ed. by Henning); and through the influence of the Prussian minister, Von Altenstein, a large number of the philosophical chairs in the Prussian universities were secured for Hegelian professors. In the second grand department into which Hegel had divided his system, the philosophy of nature, his speculations did not give the same impetus to inquiry as those of Schelling had given; but this may be accounted for from the consideration that the enthusiasm for physical investigations, which was rising when Schelling's early speculations appeared, had reached its culmination before Hegel began to attract notice. In logic, also, owing to Hegel's own exhaustive treatment, little has been done by his disciples, except in the way of explication and apology, of which Schaller's, Erdmann's, and Hinrichs's works on the science are specimens. But in psychology we find developments of the Hegelian principles by Rosenkranz, Michelet, and Erdmann; in jurisprudence, by Gans; in ethics, by Michelet; in æsthetics, by Vischer, Hinrichs, Hotho, Rosenkranz, Ruge, and Schnaase; in the history of philosophy, notwithstanding Hegel's own work, by Erdmann, Michelet, Rosenkranz, Schwegler, Zeller, &c. In the philosophy of religion, however, Hegelian speculation has been more widely and powerfully influential than in any other department; Daub, Marheineke, Rosenkranz, Conradi, Göschel, Vatke, and a host of other more or less known writers, joining with Hegel in seeking to elict the eternal meaning embodied in the historical and symbolical forms of Christianity. But as soon as Hegelianism reached this sphere of speculation, it began

to show antagonistic tendencies. These became especially apparent four years after Hegel's death, in the controversy raised by Strauss's *Leben Jesu* (1835), and continued by his *Christliche Glaubenslehre* (1840). The Hegelians then split into three sections, called severally the right, left, and center, according as they represent supernaturalism, rationalism, or a mediating mysticism. Among those of the extreme left, known also as the *young Hegelians*, and dubbed by Leo with the felicitious but untranslatable diminutive *Hegelingen*, the Hegelian philosophy, which had before been ecclesiastically and politically conservative, became thoroughly radical. In 1838 Ruge began to edit for them a special organ, *Die Halleschen Jahrbücher*, which was very influential among the youth of Germany, but was prohibited in 1847, after having been transferred to Leipsic under the title of *Die Deutschen Jahrbücher*. Weisse, Fichte, (the younger), Ulrici, Fischer, and Carriere, were named pseudo-Hegelians because, though retaining a large element of Hegelianism, they introduced at times an extraneous method and divergent results. Beyond Germany, Hegelianism is represented in France, in Italy, in Denmark, and in Sweden by numerous philosophers of note; and has also exerted an important influence on British and American thought, especially in the region of psychology.

HEGESIP'PUS, the earliest of the Christian church historians. He was b. of a Jewish family in Palestine about the beginning of the 2d c., but became a Christian at an early age, and was a member of the church of Jerusalem. He went to Rome in the pontificate of Anicetus, visiting upon his journey many churches, and especially that of Corinth, where Primus was bishop. He remained in Rome till the death of Soter (176), and is supposed to have died in the year 180. It was during his sojourn in Rome that he composed his history, in five books, entitled *Memorials of Ecclesiastical Affairs*, which, however, appear not to have formed a complete and continuous history, although they extend from the death of Christ down to the writer's own age. Unhappily, the work as a whole has perished, and we know it only from some fragments which Eusebius has embodied in his own history, and the most important of which are his account of the martyrdom of St. James and also of St. Simeon of Jerusalem. Eusebius speaks highly of the doctrinal fidelity of Hegesippus and St. Jerome, of the simplicity and purity of his style. Another work on the wars of the Jews (also in five books), ascribed to Hegesippus, is confessedly spurious. The most complete collection of the fragments of his writings is that of Gallandus in the second volume of his great collection. See also Grabe, *Spicilegium* tom. ii.; and Fabricius, *Bibl. Græca*, vii. 156.

HEGI'RA. See HEDJRAH.

HEIBERG, JOHANN LUDVIG, 1791–1860; a Danish critic and poet, son of Peter Andrea Heiberg, the political writer, and of the famous novelist afterwards the baroness Gyllembourg-Ehrensvärd. Johann was educated at the university of Copenhagen. In 1812 he visited Sweden and made some stay in Stockholm. In 1813 his first publication appeared, a romantic drama for children, entitled *The Theater for Marionettes*. This was followed by *Christmas Jokes and New Year's Tricks*. *The Imitation of Psyche*, and *The Prophecy of Tycho Brahe*. These works were looked upon as the opening of a great career. In 1817 Heiberg took his degree, and in 1819 went abroad with a grant from government. In 1822 he published his drama of *Nina*, and was made professor of the Danish language at the university of Kiel, where he delivered a course of lectures, comparing the Scandinavian mythology as found in the *Edda* with the poems of Oehlenschläger. In 1825 he went to Copenhagen for the purpose of introducing the vaudeville on the Danish stage. In 1828 he brought out the national drama of *Elverhöi;* in 1835 the comedy of *The Elves*, and in 1838 *Fata Morgana*. In 1841 he published a volume of *New Poems*, containing *A Soul after Death*, perhaps his masterpiece, and other pieces. He founded the *Copenhagen Flying Post* in 1827, and continued until 1837. In 1831 he married Johanne Louise Pætges, the greatest actress that Scandinavia has produced. His scathing satire at last begun to make him unpopular; and this antagonism reached its height when in 1845, he published his little malicious drama of *The Nut Cracker*. He received, however, in 1847 the responsible post of director of the national theater. He filled it for seven years, but resigned in 1854.

HEI'DE, a small t. of Prussia, in the province of Sleswick-Holstein, is situated in northern Ditmarsh, 32 m. n.n.w. of Gluckstadt. It is a pleasant, well-built town, with a large market-place. The inhabitants are employed chiefly in agriculture and general trade. Pop. '75, 6,722.

HEI'DELBERG, an ancient city of Germany, in the grand duchy of Baden, is situated on the left bank of the river Neckar, in one of the most beautiful districts in the country, on a narrow strip of ground between the river on the n., and the northern extremity of the Geisberg mountains on the south. It is 13 m. s.e. of Manheim, and about 54 m. s. of Frankfort-on-the-Main. The town consists mainly of one street about 3 m. in length. Among its most important buildings are the church of the Holy Ghost, through which a partition-wall has been run, and in which service according to the Catholic and Protestant rituals, is simultaneously carried on; the church of St. Peter's, on the door of which Jerome of Prague, the companion of Huss, nailed his celebrated *theses*, at the same time publicly expounding his doctrines before a multitude assembled in the churchyard; and the ruins of the castle, which was formerly the residence of the electors

Palatine, and which, in 1764, was set on fire by lightning, and totally consumed. In the cellar under the castle is the famous Heidelberg tun, 36 ft. long and 24 ft. high, and capable of containing 800 hhds. Heidelberg is celebrated for its university, which, after those of Prague and Vienna, is the oldest in Germany. It was founded by the elector Ruprecht I. in 1386, and continued to flourish until the period of the thirty years' war, when it began to decline. In 1802, however, when the town, with the surrounding territory, was assigned to the grand duke of Baden, a new era commenced for the university, and it rapidly became famous. It comprises faculties of theology, law, medicine, and philosophy, has 110 professors and lecturers, and is attended by from 600 to 800 students. Its library consists of about 300,000 volumes and 3,000 manuscripts. The trade and manufactures of the town are inconsiderable. Heidelberg, originally an appanage of the bishopric of Worms, became in 1155 the seat of the counts Palatine, and continued to be so for near six centuries. After the reformation Heidelberg was long the head-quarters of German Calvinism, and gave its name to a famous Calvinistic catechism. Heidelberg suffered much during the thirty years' war, was savagely treated by the French in 1688, and was in 1693 almost totally destroyed by them. Pop. '71, 19,988; '75, 22,335, of whom two-fifths are Catholics, and about 600 Jews.

As the residence of the rulers of the Palatinate, Heidelberg underwent all the vicissitudes of that much-suffering electorate. See PALATINATE.

HEIDENHEIM, a t. in Würtemberg, on the Stuttgart and Nordlingen railroad, 46 m. e.s.e. of Stuttgart; pop. 5,677. There are manufactures of cotton, paper, woolens, etc., and a large trade in cattle and grain.

HEIGHTS, MEASUREMENT OF, may be performed in any one of four ways: by the aid of trigonometry; by leveling; by ascertaining the atmospheric pressure at the top and bottom of the height by the barometer; or by ascertaining the boiling point of water at the top and bottom by the thermometer. As the second and third methods are treated of elsewhere (see LEVELING and BAROMETER), the first and fourth alone are here considered. The first method is often more convenient than any of the others, as it does not require the ascent of the height, nor even a near approach to it. There are two cases of the problem: Case 1 (when there is level ground in front). Let ACD be a height of irregular form, take O and M, two stations on the level ground in front, find the angles AOB, AMB, and measure OM; then as AOM, AMO (which is AMB subtracted from 180°), and OM are known, AO can be found; and since now AO and the angle AOM are known, AB can be found. If the height is regular in form, all that is necessary to be done is to measure OC, calculate CB, find AOB; then AB can at once be calculated by the ordinary rules.—Case 2 (when there is no level ground in front). Suppose the height of A above O (fig. 2) is to be found. Take another station M, from which A and O are visible, measure the angles AOM, OMA, and find OM by leveling (q.v.), then OA can be found; at O take the angle AOB (the angular altitude of A), then from OA and AOB, AB can be known. If the height of one point above another—the latter not being the observer's station—be required, then the height or depression of the first, and the height or depression of the other above or below the observer's station, must be found separately as before, then the difference (if both are above or both below the observer's level) or sum (if one is below it) of these results gives the number required. For instance (fig. 1), the height of A or AB is first found, CE or the height of E is next calculated, and their difference, AB to CE, or AF, is the height of A above E.

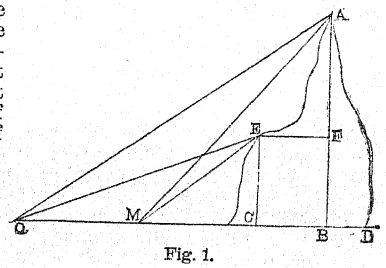

Fig. 1.

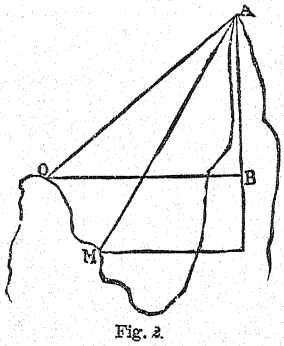

Fig. 2.

Besides this rigorous trigonometrical method, there are many ways of estimating pretty nearly the height of objects, with little or no calculation. For instance, if the height is perpendicular, and the ground in front on a level with the base, take two pieces of wood, hinged or jointed together at an angle of 45°, or a large pair of compasses opened to that angle; place one leg horizontal and directed to the base of the object, and move the instrument towards it, or from it, until the other leg points to the top; then the distance of the angle from the bottom gives the height.

The fourth method is often used in measuring the height of mountains when great accuracy is not required, or when the apparatus requisite in applying the other methods is not at hand; all the apparatus required in this method being two thermometers, a tin pot to boil the water, and a book of tables such as those given by col. Sykes in *Hints to*

Travelers. The method depends upon the fact that vapor of water or steam has a certain tension or elastic force according to its temperature, thus: at 32° it can support 0.2 of an inch of mercury; at 80° it can support 1 in.; at 150°, 7.42 in.; at 180°, 15.5 in.; at 212° (the ordinary boiling-point), 30 in., or the whole pressure of the air. By observing, therefore, the temperature at which water boils, we can find, by means of a table of the elastic force of vapor at different temperatures, the pressure, in inches of mercury, to which it is subject at the time. Now, beginning at the level of the sea, it is found by experiment that a fall of 1° in the boiling-point corresponds to an elevation of 510 ft.; at an elevation of 2,500 ft., the difference for a degree is 520 ft.; at 5,000. it is 530 ft.; at 17,000, it is 590 feet. An approximation for medium elevations may be made by taking 530 ft. on an average for the difference corresponding to 1°, then 530 *multiplied by the number of degrees between the boiling-point and* 212° *will give, approximately, the height.*

HEIJN, or **HEYN**, PETER PETERSEN, a famous Dutch admiral, was b. in 1577, at Delftshaven, near Rotterdam. Of low origin, he gradually advanced himself by his bravery to the highest dignities. As vice-admiral of the fleet of the Dutch West India company, he in 1626 engaged and utterly defeated the Spaniards in All Saints' bay, captured 45 of their ships, and returned to Holland with an immense booty. In consequence of this splendid victory, the company raised him to the rank of admiral. Only two years after this, he captured, almost without requiring to strike a blow, the grand Spanish silver flotilla, the value of which was estimated at 12,000,000 Dutch guilders. As a reward of this unparalleled success, he was, in 1629, named admiral of Holland. Shortly after, he met his death in a fight with two ships off Dunkerque. A marble monument is erected to his memory in the old church at Delft.

HEIL'BRONN (formerly, *Heiligbronn, holy well*), an important trading and manufacturing t. of the kingdom of Würtemberg, in the circle of Neckar, is situated on the right bank of the river Neckar, in a beautiful and fertile valley, 28 m. n. of Stuttgart. The church of St. Kilian, built from 1013 to 1529, a noble edifice, partly Gothic and partly Renaissance; the old town-hall, *der diebsthurm*—the thief's tower—in which Götz von Berlichingen was confined; and the house of the Teutonic knights, now a barrack, are the chief buildings. Though wine and field and garden produce are still cultivated by many of the inhabitants, trade and manufactures are the chief branches of industry now carried on here. Paper, chemical products, silk, dye-stuffs, gold, silver, and iron wares, tobacco, vinegar, etc., are manufactured for export. Gypsum and sandstone are quarried in the vicinity. Pop. '75, 21,208.

HEI'LIGENSTADT, a regularly built and walled t. of Prussian Saxony, is situated on the Leine, near the Hanoverian frontier, 50 m. n.w. of Erfurt. It was the capital of the department of the Harz, in the kingdom of Westphalia, from 1807 to 1814. Weaving, dyeing, and paper-manufacture are carried on. Pop. '75, 5,201.

HEIL'SBERG, a small t. of Prussia, in the province of Prussia, is very beautifully situated on the Alle, 43 m. s. of Königsberg. It was originally the chief town of Ermeland, one of the old divisions of Poland. Pop. '75, 5,770, who manufacture cloth, leather, etc.

HEIL'SBRONN, a small t. in the Bavarian circle of middle Franconia (pop. 1000), worthy of note as the ancient burial-place of the Hohenzollern Burggrafs of Nuremberg. The convent of Heilsbronn owes its origin in 1132 to bishop Otho of Bamberg, and its subsequent rich endowment to the counts of Ahenberg, from whom it passed in heritage to the Nuremberg princes, who thenceforward retained the lay-proprietorship of the institution. Nearly all the members of their house were buried here till the end of the 15th c., when it became the burial-place of the Franconian branch of the Hohenzollerns, till their surrender of their Franconian hereditary lands. Since the suppression of the monasteries in 1555, little has been done to keep up the splendor of Heilsbronn; but the church still retains a large number of highly interesting monuments, at once commemorative of ancient German history, and illustrative of the progress of art in Germany during the middle ages. The village of Heilsbronn, which lies on the Schwabach, possesses mineral springs, and has manufactories of wax-cloth and woolen goods. The history and antiquities of Heilsbronn convent have been made the subject of several interesting treatises, of which the most complete is Hocker's *Heilsbronnisches Antiquitätenschatz*, and Stillfried's sequel to the same work.

HEIMDALL, or HEIMDALER, in Norse mythology, a son of Odin, whose mother was of the Totun race, often said to be the son of the nine virgin sisters. He is called "Goldtooth," his teeth being of that metal; and the "owner of the vaulted arch" (rainbow), and dwells in Himminbjörg, the mountains of heaven at the end of the rainbow. He is the warder of the gods, and keeps watch that the giants do not cross over the rainbow bridge. He sees by day or night, a hundred miles around him; he hears the growing of the grass, and of the wool on a sheep's back. He figures at the death of Badur, and will appear at Ragnarök (the last day), and blow his horn, which will be heard throughout the universe, and will be the signal for the final dissolution.

HEIMR (Icelandic, *home*, or *abode*); in Norse mythology nine worlds are named: Muspelheim, Asaheim, Ljosalfaheim, Vanaheim, Mannaheim, Jötunheim, Svartalfa-

heim, Helheim, and Niflheim. The highest is Muspelheim (world of fire), the home of Surt, in the highest region of which Gimle (heaven) was seated. The lowest is Niflheim (mist-world), the home of cold and darkness, having in its midst the fountain Hvergelmer, where the dragon Nidhogg dwells. Midway between Muspelheim and Niflheim is Mannaheim (man's world), the round plane of the earth surrounded by the ocean. The gods gave Midgard to the first human pair as a home for their descendants. Far above Mannaheim is Asaheim (world of the gods), forming an immense vault above the earth. In the midst of this is Idavold, the place where the gods assemble, containing Odin's throne Hlidskjalf. Beyond the ocean is Jötunheim (home of giants), separated from Asaheim by the river Iting, which never freezes over. Next above the earth is Ljosalfheim (home of the elves of light), and between it and Asaheim is Vanaheim (home of the vans). Further down is Svartalfheim (world of dark elves); further still Mannaheim, and lastly Helheim (world of the dead, or *hel*), doubtless the original of the English "hell."

HEIMSKRINGLA. See SNORRI STURLESSON.

HEINE, HEINRICH, a modern German poet and wit, was b. at Düsseldorf, of Jewish parents; the date of his birth is Dec. 12, 1799, (not, as often asserted, Jan. 1, 1800). In 1819 he proceeded to the university of Bonn for the purpose of studying law; but he devoted himself with greater ardor to the study of modern and ancient German literature, under the auspices of his master and friend, August Wilhelm Schlegel. He subsequently studied at Berlin and at Göttingen, at which latter place he took his degree as doctor of law in 1825. About this time he abandoned Judaism, and was baptized in the Lutheran church of Heiligenstadt. A visit to the Hartz and to Italy supplied him with materials for his *Reisebilder* (Pictures of Travel, Hamb. 4 vols., 1826–31). This book obtained, on its first appearance, an extraordinarily brilliant success. "Young Germany," in particular, became drunk with enthusiasm. His *Buch der Lieder* (Book of Songs, Hamb. 1827; 10th edit. 1852)—a portion of which had first appeared as *Youthful Sorrows* in Berlin, 1822—was no less fortunate. Many of these songs are of the most exquisite and ethereal beauty. They are unmatched in German literature, except by the lyrics which Goethe wrote in his youth. The revolution of July threw Heine into a violent fit of democracy, and in 1831 appeared his *Kahldorf über den Adel, in Briefen an den Grafen M. von Moltke* (Kahldorf on the Aristocracy, in Letters addressed to Count M. von Moltke). He now found it advisable to leave Germany, and at once proceeded to Paris, where he resided for the rest of his life, cultivating *belles-lettres*, both with a brilliancy and malice hitherto almost unheard of. In 1835 he married a certain "Mathilde," who figures much in his writings, and in 1843–44 visited his native country, to see his mother. On his return he published *Deutschland; ein Wintermärchen* (Germany; a Winter's Tale), in which he recounts imaginary adventures and burlesque episodes, and in which a great number of his countrymen, kings, statesmen, professors, authors, artists, etc., are mercilessly satirized and abused. In 1847 Heine was attacked by disease of the spine, and was almost constantly bedridden. He suffered the most acute pain, together with the loss of eyesight, with the most remarkable equanimity and even good humor, till the day of his death, which took place at Paris, Feb. 17, 1856. His will expressed a desire that no religious ceremonies should be celebrated at his funeral. "This," however, he adds, "is not the weak fancy of a freethinker. For the last four years I have cast aside all philosophical pride, and have again felt the power of religious truth." What faith is to be placed in this assertion may easily be concluded from his subsequently designating the Deity as the "mighty Aristophanes of Heaven," who laughs at his calamities. Besides the works already mentioned, Heine wrote *Französische Zustände, Der Salon, Shakespeare's Mädchen und Frauen, Neue Gedichte, Atta Troll, Romanzero*, etc. A complete edition of his works was published at Philadelphia, by John Weik, in 1856; another was published, by Hoffmann Campe, in Hamburg (1861–63). A French edition of his works (Michel Levy, Paris,) was prepared, with his co-operation, by Loewe-Weimars, Gererd de Nerval, and St. Réné-Taillandier, English versions of some of these are Leland's translation of *The Pictures of Travel* (1856), *The Book of Songs*, by J. E. Wallis (1856), the *Poems* complete by E. A. Bowring (1859), and the *Poems and Ballads* by Theodore Martin (1879). See *Heinrich Heine*, by W. Stigand (1876).

HEINECCIUS, JOHANN GOTTLIEB, a learned jurist of Germany, b. Sept. 11, 1681, at Eisenberg, studied theology at Leipsic, and law at Halle, where, in 1713, he was made professor of philosophy, and in 1720 professor of law. In the latter capacity he went, in 1723, to Franeker, in 1727 to Frankfort-on-the-Oder; but in 1733 returned, as professor of law and philosophy, to Halle, where he died Aug. 31, 1741. His works display a thorough acquaintance with all the departments of jurisprudence, but especially with Roman and German law; and their varied learning, logical arrangement, and elegant Latin, long maintained for them a classical character. His *Antiquitatum Jus Romanum Illustrantium Syntagma*, has been re-edited so lately as 1841 by Mühlenbruch, and his *Elementa Juris Civilis secundum Ordinem Institutionum* (edited by Biener, 1815); his *Elementa Juris Civilis secundum Ordinem Pandectarum*, etc., are still studied by jurists. Heineccius's son, JOHANN CHRISTIAN GOTTLIEB HEINECCIUS, b. 1718 at Halle, died 1791 at Sagan, was for a long time professor in the academy for young noblemen

at Liegnitz, and edited, besides several of his father's works separately, a complete collection of them (*H. Opera Omnia*, 9 vols., Geneva, 1771). Heineccius's brother, JOHANN MICHAELIS HEINECCIUS, b. at Eisenberg 1674, died Sept. 11, 1722, was a celebrated pulpit orator in Halle, and also the first who studied seals scientifically. His theological writings are forgotten, but he is remembered by his *De Veteribus Germanorum aliarumque Nationum Sigillis* (Leip. 1710; 2d ed. 1719), and by the work edited in conjunction with Leuckfeld, *Scriptores Rerum Germanicarum* (Frankf. 1707).

HEINECKEN, CHRISTIAN HEINRICH, 1721–25; a child of extraordinary precocity; b. at Lubeck, where his father was a painter. Able to speak at the age of ten months, by the time he was one year old he knew by heart the principal incidents in the Pentateuch. At two years he had mastered the sacred history; at three was acquainted with history and geography, ancient and modern, sacred and profane; besides being able to speak Latin and French; and in his fourth year he devoted himself to the study of religion and church history. He was able to reason on and discuss the knowledge he had acquired. Crowds of people flocked to Lubeck to see the wonderful child; and in 1724 he was taken to Copenhagen at the desire of the king of Denmark. On his return to Lubeck he began to learn writing, but his sickly constitution gave way and he died in his fourth year.

HEINSIUS, ANTONIUS, 1641–1720; grand pensionary of Holland, confidential friend and agent of William of Orange. After the latter became king of England he left the affairs of Holland in the hands of Heinsius, who brought about the participation of Holland in the grand alliance concerning the Spanish succession with England, Prussia, Denmark, Savoy, and Hanover. He sturdily opposed the efforts of Louis XIV. to open negotiations with the allies for peace, and when it was at last effected he was the last to sign the treaty.

HEINSIUS, DANIEL, 1580–1655; a famous Dutch scholar. In 1594, being already remarkable for his attainments, he was sent to the university of Franeker to perfect himself in Greek under Henricus Schotanus. He stayed at Franeker half a year, and then settled at Leyden for the remaining sixty years of his life. There he studied under Joseph Scaliger, and there he became the friend and associate of Marnix de St. Aldegonde, Janus Douza, and Paulus Merula. His proficiency in the classic languages won the praise of all the best scholars in Europe, and offers were vainly made to him to accept honorable positions outside of Holland. He soon rose in dignity at the university of Leyden. In 1602 he was made professor of Latin in the university of Leyden, in 1605 professor of Greek, and at the death of Merula, in 1607, he succeeded that illustrious scholar as librarian. The Dutch poetry of Heinsius is of the school of Roemer Visscher, but attains no very high excellence. It was, however, greatly admired by Martin Opitz, who was the pupil of Heinsius, and who, in translating the poetry of the latter, introduced the German public to the use of the rhyming Alexandrine.

HEINTZELMAN, SAMUEL P., b. Penn., 1805; graduated at West Point, served on the northern frontier in the Florida war and in the war with Mexico, and later in California and on the Texas frontier chiefly against the Indians. In 1861 he was made col., and assigned to duty in Washington. The same year he was appointed brig.gen. of volunteers and commanded at Alexandria, Va. He was wounded in the first battle of Bull Run. In 1862 he commanded the army corps before Yorktown, and was engaged in the battle of Williamsburg. Promoted to maj.gen., he was in the Fair Oaks and the seven days' conflict, and in the second Bull Run battle, as well as at Chantilly. He commanded the defenses at Washington, and in 1864 assumed the command of the northern department, Ohio, Michigan, Indiana, and Illinois, and in the autumn of 1865 was mustered out of the volunteer service. Early in 1869 he was retired from duty, with the rank of maj.gen. in the regular army.

HEIR, in Scotch law, is often used in a loose sense to denote the persons entitled to succeed to the heritable as well as to the movable estate. In Scotland the same rule exists as in England, that if a person do not by deed *mortis causa* (which operates like an English will) dispone or convey his estate to some other person, the law points out who is to take such estate, and that person is the heir-at-law. The rules by which the heir to heritable estate in Scotland is pointed out differ considerably from the English rules. These rules are the same as to the descendants of the deceased person A. But after A's descendants are exhausted, differences begin, for then it is not the father, nor yet the eldest brother of A, but the next younger brother of A, who next succeeds; then the next younger again, until the youngest brother; after whom and his descendants comes A's next elder brother; and so on upwards to the eldest brother of all. In Paterson's *Compendium of English and Scotch Law*, the different order of succession in both countries is shown in a map. There was a difference in Scotland as regards heritable estate which had been purchased by a person (in which case it was called conquest), and who died leaving brothers both elder and younger: in such case, contrary to the general rule, the estate went first to the next elder brother. But after 1874 this distinction was abolished. In Scotland, when females succeed equally, they are called heirs-portioners (q.v.). In Scotland, though not in England, the mother never succeeds in any event, or any relatives, except brothers and sisters german, who trace through her.

There was an important difference in Scotland as to the vesting of the heritable estate of a deceased person. At the death of the owner, his heritable estate did not immediately vest in the heir, but lay in an intermediate state, then called the *hæreditas jacens*, and the person entitled to be the heir had to be served heir, or make up his titles, and enter to the estate. This was altered in 1874, and the estate now vests at once upon the death of the last owner, 37 and 38 Vict. c. 94, s. 9. The general rule also exists in Scotland, that the heir-at-law takes the estates subject to his ancestor's debts; indeed, he used to be liable for all the debts, though far exceeding the property left, provided that he did not take certain precautions to escape this passive representation, as it was called, for the barbarous maxim prevailed, *hæres est eadem persona cum defuncto*. The steps to be taken to guard against liability in such cases are matters of detail which do not require to be described, and are no longer necessary since the act of 1874. Another important distinction exists in Scotland, viz., that an heir need not be born in lawful wedlock, as in England, but it is enough if the father marries the mother afterwards, and so legitimates him.

The word "heir" is often distinguished into several kinds. Thus, an *heir by destination* is a person who is pointed out by a certain deed to succeed in a certain order. So is an *heir of provision*. An heir-at-law is also often called an *heir of line*, because he succeeds according to a certain line or order; and an *heir-general*, because he is the general representative of the ancestor, in contradistinction to an heir-special, who is pointed out by deed. An *heir of entail* is the person who succeeds to an entailed estate by virtue of the deed of entail, which prescribes the order of succession. An *heir of conquest* meant, as above stated, the heir of an ancestor who acquired the estate in question by purchase, and not by succession. See SUCCESSION.

HEIR (*ante*), at common law, one who is born or begotten in lawful wedlock, and upon whom the law devolves an estate immediately upon the ancestor's death. No one is the heir of a living person, but one may be the heir apparent or presumptive. Neither a monster nor a bastard can be an heir. In civil law any one who succeeds to the rights and occupies the place of a deceased person is an heir. An *heir apparent* is one who has an absolute right to an inheritance if outliving the possessor. *Beneficiary heirs* accept succession under the benefit of an inventory, the main purpose of which is to limit liability for debts. A *collateral heir* is one not in direct line, as a brother, uncle, aunt, nephew, or niece. A *conventional heir* takes succession by virtue of a contract, as by marriage contract. A *forced heir* is one who cannot be disinherited. Any heir at common law is a general heir. Irregular heirs are (in Louisiana) those who are neither testamentary nor legal, but are established for the succession by law. The civil code of that state provides that when the deceased has left neither lawful descendants nor ascendants nor collateral relations, the law calls to the inheritor a surviving husband or wife, or his or her natural children, or the state *heirs at law* are the same as heirs general, those who stand in natural succession. *Legal heirs* are persons of the same blood as the deceased who take succession by force of law, thus differing from a testamentary heir who succeeds by the act of the deceased. Three classes of legal heirs are recognized; the children and other lawful descendants; the fathers and mothers and other lawful descendants; and the collateral kindred. An *heir presumptive* is one who may be the legal heir, but whose right may be destroyed by a later born child. A *testamentary heir* succeeds under a regularly made will. *Unconditional heirs* inherit without reservation.

HEIR, or HEIR-AT-LAW, in English law, means the person who, in the event of no will being left by a deceased person which indicates a different person, is entitled by law to succeed to the real estate of such deceased person. The term is never used in the loose sense which prevails in Scotland, as including both heirs, properly so called, and executors or next of kin. When a person in England or Ireland does not think fit to exercise the undoubted right which belongs to him of leaving his real property by will to whomsoever he pleases, to be enjoyed after his own death, the law steps in, and appoints such a person for him, and this person is the heir-at-law. The law, in selecting these heirs, proceeds on certain fixed rules of primogeniture and relationship, preferring males to females. The eldest son is preferred to all the rest of the family, and his descendants; then the next eldest son and his descendants; and so on to the youngest son, after whom the daughters succeed equally or all together, and are then called coparceners. After the descendants of the deceased person, who may be called A, are exhausted, then A's father succeeds; after whom follow A's eldest brother and descendants; then A's next eldest brother; and so on to the youngest brother; after failure of whom and his descendants, then all A's sisters by the full blood succeed equally as coparceners; then A's half-brother by the father's side, and descendants, etc.; then A's half-sisters by the father's side, all as coparceners; after whom succeed A's paternal uncles and aunts in a similar order. Where there are no heirs whose relationship can be traced to the deceased person, then the real estate goes to the crown.

The moment a person dies leaving real estate in England, such real estate vests at once in the heir-at-law, whoever that may be, without any ceremony or formality being required. The heir-at-law, however, takes the property subject to the debts of the deceased, and must pay off all these, provided there is no personal estate sufficient to

pay them, but in no case can he be liable beyond the value of the estate itself. The heir, it is true, may be sued for these debts, in the first instance, by any of the creditors, but he may afterwards have the real estate exonerated, thereby shifting the liability to the personal estate. When the deceased had land which was subject to a mortgage debt, then that debt is a burden on the land, and must be borne by the heir; but the law was otherwise before 1854.

The law of succession in Ireland is entirely the same as in England. See SUCCESSION.

HEIR-APPARENT, in English law, means the person who is certain to succeed if he outlive his ancestor; thus the eldest son is so, because no other person can ever come between and obtain precedence. In Scotland the phrase is sometimes used also popularly in this sense, but the words "apparent heir," when used technically there, mean quite a different thing, viz., the person who, after his ancestor's death, is entitled to succeed, provided he make up his titles, but who has not yet actually done so. The apparent heir has a year to deliberate, called the *annus deliberandi*, whether he will enter upon the property, because the responsibility is so much greater in Scotland than in England.

HEIRESS means a female heir when there are no male heirs to succeed. Where there are several females, all sisters, who are in that case equally entitled, they are sometimes called co-heiresses, but more properly *coparceners* in England, and *heirs-portioners* in Scotland.

HEIRESS. In heraldry, a lady is accounted an heiress if she has no brothers who leave issue. The husband of an heiress is entitled to bear her arms in an escutcheon of pretense, i.e., a small escutcheon in the center of his paternal shield, and the children of an heiress may quarter her arms with their paternal coat. Neither practice is of very early introduction in heraldry. See MARSHALING OF ARMS.

HEIR AND EXECUTOR, a short phrase to denote that branch of the law in which a leading distinction is made between the two kinds of property left by a deceased person, viz., real and personal. All a man's property falls under one or other of these heads. If real, it goes to the heir-at-law; if personal, it goes to the executors or administrators, often called the personal representatives. In Scotland the same leading distinction exists under the head of heritable and movable, but in Scotland some things are classed among heritable, which in England would not be classed among real property. Thus, in Scotland, a lease is heritable property, and goes to the heir-at-law, while in England it is personal, and goes to the executor or administrator. So annuities in England are personalty, and in Scotland are heritable subjects, and there are some other differences not easily to be explained popularly.

HEIR-FEMALE means the female heir connected through a female.

HEIRLOOM, in English law, means certain chattels which go to the heir-at-law by special custom, and have already come through several descents. The chattels included are the best of everything, as pots, pans, tables, &c. But the right is obscure. The word is more frequently used now to designate some chattel which a testator has bequeathed to the person, whoever he may be, who is to take the real estate. In Scotland a somewhat similar, but by no means identical, phrase is used, viz., *heirship movables*, which is a wider right, and includes the best articles of furniture in the house of a person who left heritable property. The extent of this right is also not clearly settled.

HEIR-MALE means the male heir connected through a male.

HEIR-PRESUMP'TIVE, in English law, means the person who would succeed if the ancestor were to die immediately, but who may ultimately be displaced if the ancestor live longer. Thus, an only daughter is the heir-presumptive until a son is born, who thereupon displaces her. In Scotland, though the phrase is also used popularly in this sense, yet in its technical sense it means the person who is certain to be heir if he outlive his ancestor. In short, a presumptive heir in Scotland would be called an heir-apparent in England.

HEIRSHIP MOVABLES. See HEIRLOOM.

HEIRS-PORTIONERS, in Scotch law, mean either two or more females, being sisters, or sisters and the children, male and female, of deceased sisters, who are entitled to succeed to heritable estate. Thus, if A dies leaving three daughters, all three succeed equally if alive; or if some had already died leaving children, then the children represent the parent, and succeed to the parent's share along with the surviving sisters, all being called heirs-portioners. In such cases, the eldest heir-portioner is entitled to the mansion-house over and above her equal share of the rest. She alone also takes a peerage or dignity, if there is any in the family. In England coparceners, though resembling heirs-portioners, have not identical rights. See Paterson's *Comp. of E. and S. Law*, s. 777.

HEL, the northern goddess of the dead, who dwelt beneath one of the three roots of the sacred ash Yggdrasil, was the daughter of the evil-hearted Loki (q.v.), by the giantess Angurboda. Hel, together with her brothers, the wolf Fenrir, and the serpent

Jormundgand, was bred up in the giant's home of Jötunheim, where she remained, till at the request of the Æsir, or gods, the All-father sent for her and her brothers; when, knowing that by their origin these children must prove a great source of calamity, he resolved upon their destruction, and after casting the serpent into the deep ocean, which surrounds all lands, and where it has grown so large that it encircles the whole world, and bites its own tail, he hurled Hel into Niflheim (q.v.), over which he gave her authority, and in which she was to assign places to all who die of sickness and age. Her vast abode is surrounded by a high inclosure with massive gates. Her dwelling is *elindnir*, dark clouds; her dish, *hungr*, hunger; her knife, *sultr*, starvation; her servants, *gangliti*, slow-moving; her bed, *kör*, sickness; and her curtains, *blikiandabli*, splendid misery. She is easily recognized by her fierce aspect, and her half-black, half flesh-colored skin. Hel was inexorable, and would release no one who had once entered her domain. See BALDER.

After the introduction and diffusion of Christianity, the ideas personified in Hel gradually merged, among all the races of northern and German descent, in the local conception of a hell, or dark abode of the dead. See Thorpe's *Northern Mythology*, Grimm's *Mythologie*.

HEL, in Norse mythology, a goddess or giantess who dwells in Niflheim under the roots of Yggdrasil, and rules over nine worlds. Her residence is called Helheim, and the Hel-way thither is long. Its course is northward and downward; gloomy rivers surround her world, one of which flows through valleys filled with swords. A dog stands outside of a cave, and with loud howling greeted Odin when he rode down to Hel to wake the prophetess in her grave-mound e. of the Hel-gate to inquire the fate of Balder. Hel binds the dying with chains that cannot be broken. She receives all who die of sickness or old age. Her company is large, but her shadowy realm has room for all. The worst go into Niflheim; or the ninth and lowest world, into the place named Anguish, the threshold of which is Precipice, their table is Famine, their waiters Slowness and Delay, and their bed is Care. Hel rides a horse with only three feet. Faith in this goddess is not yet extinct. Hel-shoes (hell-shoon) are still put on the feet of the dead, and her dog is heard barking to give warning that death is at hand. In Norway when any one recovers from dangerous illness he is said to have given Hel a bushel of oats, in allusion to the belief that she wanders around in the form of a horse. That the English noun "hell" is derived from the name of this goddess seems beyond doubt.

HELAMYS, *Pedetes capenses*, the Jerboa or jumping hare; a rodent of s. Africa, of the family *pedetidæ*. Its length is 12 to 15 inches; it occasionally jumps over 30 feet. It is exceedingly timid, and its habits are nocturnal.

HEL'DER, a thriving seaport and strongly fortified t. in the province of Holland, Netherlands, stands on the *Marsdiep*, which unites the Zuyder Zee and the German ocean, and separates n. Holland from Texel. It is 45 m. n.n.w. of Amsterdam, with which it is connected by the grand ship canal. See AMSTERDAM. Helder is protected from the inroads of the sea by an enormous dike, six m. in length, 40 ft. broad at the top, on which there is a good road, and which presents to the sea a sloping side of 200 ft., inclined at an angle of 40°. This dike is built entirely of huge blocks of Norwegian granite. Here alone, along the whole coast, is deep water found close to the shore, a fact accounted for by the rush or "race" of the tide, the violence of which is so great here that no sand is allowed to accumulate. Fort Kykduin is surmounted by a tower and light-house. Its harbor, which is well sheltered by the dike, can easily contain 300 large vessels. Pop. (Dec. 31, '74), 20,729.

HELEN, the daughter of Zeus and Leda, wife of Tyndareus, king of Sparta. According to the ancient legend, she was so exceedingly beautiful, that at the age of ten she was carried off by Theseus and Pirithous, but was recovered subsequently by her brothers, Castor and Pollux. Tyndareus afterwards engaged her suitors, who numbered about 30, by a solemn oath, to unite together to aid the husband whom Helen should choose, in case of any attempts being again made to carry her off. In accordance with this oath, her husband, Menelaus, when she was afterwards carried off by Paris, son of Priam, king of Troy, summoned all the princes of Greece to avenge the injury he had sustained, and thus gave rise to the Trojan war. The stories concerning the fate of Helen are inexhaustible. The ordinary legend states that after the death of Paris, she voluntarily married his brother Deiphobus, and that on the taking of Troy, in order to recover the favor of Menelaus, she betrayed Deiphobus into his hands. On the fall of Troy, she returned with Menelaus to Sparta; but after his death was driven from the country, and having gone to Rhodes, was there murdered by the queen of the island. By her husband Menelaus, she had one daughter, Hermione. Greek artists have represented her in their works as the prototype of female beauty, and she has frequently been celebrated by the tragedians in their dramatic works.

HELENA, a t. in Phillips co., Ark., on the Mississippi, 75 m. below Memphis, at the e. terminus of the Arkansas central railroad; pop. 5,000. It has 9 churches, 2 newspapers, oil mills, and some manufactories, but its main business is in cotton, of which 40,000 to 50,000 bales are shipped yearly.

HELENA, the capital of Montana, in Lewis and Clarke co., 14 m. w. of the Missouri, and near the Rocky mountains; pop. 10,000. Rich gold mines were found in its vicinity about 1864, and since then the city has grown rapidly. It has a court-house, banks, a land office; quartz crushing, flour, and lumber mills; daily and weekly newspapers, a hospital, a Roman Catholic academy and convent, and the public offices of the territory.

HEL'ENA, the name of several female saints of the Catholic church, the most celebrated of whom is the empress Helena, wife of Constantius Chlorus, and mother of Constantine the great. The place of her birth is a subject of controversy: according to one account, she was born in Bithynia; but the English church historians commonly claim her as a native of Britain, to which opinion some probability is added from the fact, that her first-born son, Constantine, was born in that country. She became a Christian during the youth of Constantine, and it is thought not unlikely that her example and her teaching co-operated with public motives in determining Constantine to embrace the Christian religion. It was not, however, till after the defeat of Maxentius that Helena formally received baptism. She was at this time far advanced in years; but she survived her baptism for a considerable time, and deserved the gratitude of the Christian community by her zeal for the advancement of religion, and her many acts of piety and munificence. Among the public events of her Christian life, recorded by Catholic historians, the most remarkable is the discovery (according to the belief of the time) of the cross of our Lord (see HOLY PLACES). She died in the year 328, or, according to another account, in 326.—Two other royal or princely ladies of the same name are honored as saints. The first, whose honors are confined to the Russian church, was the wife of the grand duke Igor, and at her baptism in Constantinople (955), changed her original name, Olga, into Helena. She is held in the highest reputation for sanctity in the Russian church. The other was a native of Skofde, in west Gothland, and lived in the 12th century.

HELE'NA, ST., perhaps the best known of all the lonely islands in the world, is situated in the Atlantic, in lat. 15° 55′ s., and long. 5° 44′ w. Greatest length of the island, 10½ m.; breadth, 7 m.; area, 47 sq. miles. Pop. '71, 6,241. It is 850 m. from the nearest land, the island of Ascension, and about a half more from the nearest point of the African continent. The island was discovered in 1502, on St. Helena's day (May 22), whence its name, by the Portuguese navigator, Juan de Nova Castella. It afterwards became a Dutch possession, was ceded by Holland about the middle of the 17th c. to the English East India company, and made over by them to the British crown in 1833. Its value consisted in its being a convenient halting-place on the homeward voyage from India—a value enhanced by the fact, that the cape of Good Hope had, ten years previously, been colonized by the Dutch. On the outward voyage, however, it was not available for sailing-vessels, which, under the influence of the easterly trade-winds, could reach it at last only after overshooting it far both to the w. and to the s; and this difficulty of access peculiarly fitted it to be the residence of Napoleon Bonaparte, who here lingered in hopeless captivity from 1815 to 1821. The nature of the coast, too, would render a hostile landing next to impracticable, presenting, as it does, either a naturally scarped face of cliffs ranging from 600 to 1200 ft. high, or the mouths of ravines protected by forts and other military works. There is one good inlet, called James's bay, possessing a fine harbor. Here is situated James's town, the only place of any note in the island.

About 6,000 acres—one-fifth of the entire surface—are available for cultivation, but not more than 500 are actually under cultivation; while uplands of volcanic origin, rising in Diana's peak (in the center of the island) to the height of 2,700 ft., feed large numbers of goats. There are several plains, the largest of which is Longwood, where stands the house in which Napoleon lived. Supplies of provisions, properly so called, are mostly imported, more especially for the resident population.

HEL'ENSBURGH, a rising t. and favorite watering-place of Scotland, in the co. of Dumbarton, is pleasantly situated on the right bank of the firth of Clyde, opposite Greenock, from which it is 4 m. distant, and 23 m. w.n.w. of Glasgow by railway. It was founded in 1777 by sir James Colquhoun, and named after his wife Helen. In 1858 direct railway communication was opened up between Helensburgh and Dumbarton and Glasgow, and since that time the town has greatly increased. Pop. '71, 5,975; but in summer, the numbers are nearly doubled.

HELI'ACAL RISING (from Gr. *helios*, the sun). A star is said to rise heliacally when it rises just before the sun. When the sun approaches a star which is near the ecliptic, the star becomes for a season invisible—the heavens being too bright in the quarters of sunrise and sunset, at the times of its rising and setting, to allow it to be seen. But when the sun, progressing in its orbit, separates from the star, and the latter begins to rise first, it in time rises so much earlier than the sun, as just to be visible before daylight. It is then said to rise heliacally.

HELIAND, a Saxon poem of the 9th century. The portion yet preserved sets forth the life of Christ as told by the four evangelists, whose various narratives the author seeks to harmonize. It is thought to have been composed by a Saxon writer of unknown

name at the request of the emperor Louis the pious. Like all the most ancient remains of Teutonic poetry, *Heliand* is written in alliterative verse, of which the writer was perfect master. It is almost the only remnant of the old Saxon dialect, and has therefore a high philological value, but it is still more interesting from a literary point of view. The poet does not merely repeat his authorities; while true to the main facts of the original story, he allows his imagination to play upon them in a free and poetic spirit. He realizes intensely the incidents in the career of the Founder of Christianity, and imparts vitality and definiteness to the received conception of His character. The diction is simple and popular, but marked by an elevation of sentiment adapted to the theme, and the author often succeeds most happily in imparting to his style color, variety, and animation. The 9th c. is remarkable in the history of old English and old Norse poetry; the *Heliand* affords proof of that same impulse which operated also upon the higher minds of Germany. The historical aspects of this great work are hardly less important. Of all the German tribes the Saxons were the last to submit to the influence of Christianity. They regarded baptism as the symbol of Frankish supremacy, and clung tenaciously to the ancient Teutonic faith. It was only when Charlemagne, after more than 30 years of warfare, forced the new creed upon them that it gained acceptance by them, and then when they talked of Christ and the saints, they associated them with Woden and Thor, and took delight in the heathen poetry which had been handed down from remote periods.

HELIAN'THUS. See JERUSALEM ARTICHOKE, and SUNFLOWER.

HELI'CIDÆ (Gr. *helix*, a spiral), a large family of gasteropodous mollusks, of the order *pulmonata*, and of which snails (q.v.) are familiar examples. The order is distinguished by having part of the mantle cavity formed into an air-sac or lung. The helicidæ are land mollusks. They have a spiral shell, into which the body of the animal can be withdrawn. Most of the species pretty much resemble the common snails in their habits, feeding on vegetable substances of various kinds, and often proving troublesome to the farmer and gardener.

HEL'ICON, a mountain, or rather a mountain-range in the s.w. of the province of Bœotia, in Greece, may be regarded as a continuation of the range of Parnassus. It was celebrated by ancient poets as the favorite seat of the Muses. The loftiest summit (now called Paleovúvi) is about 5,000 feet high. At the bottom of Helicon stood the village of Ascra, the residence of Hesiod, and the seat of the earliest school of poetry in Greece. In ascending the mountain from Ascra (now Pyrgáki), the traveler passes the famous fountain of Aganippe, the waters of which were fabled to bestow inspiration. The grove of the Muses is supposed to have been situated in a hollow at the foot of Mount Mirandáli, one of the summits of Helicon. Leake considers that its site is now occupied by the church and convent of St. Nicholas. Twenty stadia above this was the fountain of Hippocrene, probably the modern Makariotissa, where there is still a fine spring.

HE'LIGOLAND, or HELGOLAND (Holy Land), a small island in the North sea, belonging to Great Britain, is situated about 35 or 40 m. n.w. of the mouth of the Elbe, in lat. 54° 11′ n., and long. 7° 53′ east. It is about a m. long from n. to s., and one-third of a m. from e. to w., one-fifth of a sq.m. in superficial area, and about 2¾ m. in circumference. The island consists of an upper and a lower quarter; the former, "The Oberland," is a rock 200 feet in height, and 4,200 paces in circumference, on which stands a town of 350 houses, and 1913 inhabitants; the latter, "Sandy Island," is a patch of shore with 60 houses s.e. of the cliff, and communicating with it by a flight of 173 steps. The surging of the sea, which has already greatly diminished the size of the island, is fast consuming its shores, and will probably, at no great distance of time, reduce it to a mere sand-bank. Heligoland has two good ports, one on its n. and another on its s. side. The inhabitants are supported chiefly by fishing and commerce, by serving as pilots, and by the strangers who visit Heligoland for the excellent sea-bathing Sandy island affords. A light-house stands on the cliff near the village. There is also a prison, but it is never occupied. The annual value of the fisheries is about £5,000, and the chief products are lobsters and haddocks. Heligoland is an important place in time of war, and commands the German trade in the North sea. The island, which was taken by the English from the Danes in 1807, and was formally ceded to them in 1814, has an English governor, but the internal affairs are managed by a council of the islanders. Four batteries, manned by a garrison of British soldiers, are mounted on the cliff. The British establishment maintained on Heligoland costs about £1000 a year. Steam-boats run between this and Hamburg. Heligoland was anciently sacred to the goddess Hertha, and was the island to which the tribe of the Angli who inhabited the mainland opposite, went to perform religious rites in her honor. On a map discovered by sir William Gell, the situation of many temples, villages, and large tracts of country, are delineated, all of which were swallowed up by the sea, between 700 A.D. and 1200 A.D., according to D'Anville. The sea continued its encroachments, and, before the end of the 17th c., had submerged several churches and monastic establishments. Christianity was first preached here by St. Willibrod in the 7th c., after whose time the island received its present name. Before this, it was called Fosetisland, from the Frisian goddess, Foseta, who had a temple here. The inhabitants

of Heligoland are divided into two classes, differing both in race and occupation—the one being fishers, the other merchants, cultivators, etc. The first are Frisians, a tall and muscular race of hardy seaman, simple and primitive in their habits and holding land-labor in contempt. The merchant class consists of immigrants from Hamburg and other places on the mainland, or their descendants.

HELIOCEN'TRIC, a term in astronomy, signifying that the sun (Gr. *helios*) is taken as the center of reference or view. It is opposed to geocentric, which indicates that the earth is taken for center.

HELIODO'RUS, the earliest and best of the Greek romance writers, was b. at Emesa, in Syria. The church historian Socrates says he became a Christian, and was bishop of Trikka, in Thessaly, about the end of the 4th c., A.D. But it now seems more probable that the romance writer was a Neo-Pythagorean sophist of the 3d century. The work by which he is known is entitled *Æthiopica.* It extends to ten books, and narrates in poetic prose, at times with almost epic beauty and simplicity, the loves of Theagenes and Charicleia. The work is distinguished from the later Greek romances by its vigor and its pure morality. See Rohde, *Der Griechische Roman* (1876). There are editions by Korais (1805), Bekker (1855), and Hirschig (1856).

HELIOGA'BALUS. See ELAGABALUS.

HELIOGRAPHY (*sun telegraphy*), a name given to a method of communicating between distant stations by reflections of the sun upon a mirror or system of mirrors. One great advantage of this method over the ordinary signal system is that the apparatus is more portable, but it can be successfully used only in regions where the atmosphere is clear of clouds through considerable periods of time. Anybody who has any idea of the ordinary method of telegraphing by electricity with the ear alphabet, will understand how spaces of time may be employed to indicate letters and words by means of the eye. There are two methods: the reflector may be obscured except when the screen is temporarily removed to produce a flash or letter; or the reflector may be kept exposed except when it is obscured to produce a letter. The first method is said to be the easier for the beginner, but the second less fatiguing to the eye. The distance through which this mode of communication may be carried on varies with the size of the mirrors and the clearness of the atmosphere. From the Himalayas a 5 in. mirror has communicated distinct signals 60 miles. The instrument could be used with good success on the Andes. When the signaling station forms an angle greater than a right angle between the sun and the receiving station, two mirrors are used to prevent too great a loss of rays by oblique reflection. The mirrors are mounted on tripods, and are held by a socket, or a universal joint. Besides its use as a signaling instrument, the heliograph has served to define distant points in a survey, and for this purpose was employed in the triangulation of India. It was also used by the late astronomer-royal of England at the cape of Good Hope in verifying the arc of the meridian.

HELIOM'ETER, "sun measurer" (from *helios,* the sun, and *metron,* a measure), is an instrument invented by M. Bouguer in 1747, by means of which the diameters of the heavenly bodies can be measured with great accuracy. As improved by Dollond, the object-lens of the instrument is in two halves, each of which will form a perfect image in the focus of the eye-piece; and the images may be made to diverge, coincide, or overlap each other, by varying the distance between the half-lenses. If the diameter of the sun is to be measured, the two lenses are adjusted so that the images may touch each other, then the distance between the centers of the two object-glasses measured in seconds gives the diameter of the sun. Fraunhoffer has made many remarkable improvements on the heliometer.

HELIOP'OLIS (*City of the Sun*), the Greek name of the city called by the Egyptians On, stood on the e. side of the Pelusiac branch of the Nile, near the apex of the Delta, and was one of the most ancient and important of Egyptian cities. Here were the headquarters of the wisdom of the Egyptians. From the priests of Heliopolis, Solon, Thales, and Plato are reported to have learned. Manethon, the historiographer of Egypt, was chief priest of Heliopolis, an office filled centuries earlier by the father-in-law of the Hebrew Joseph. The ruins of Heliopolis still cover an area nearly 3 m. square. One of the red granite obelisks, long famous as Pharaoh's needles, is still standing near the hamlet of Matarieh. There is reason to suppose that the obelisk called "Cleopatra's needle," lately brought to England, had originally been brought to Alexandria from Heliopolis.

HELIOP'OLIS SY'RIÆ. See BAALBEK.

HE'LIOS, the Greek name of the sun (the Roman *sol*), who was worshiped as a god. He was, according to Homer, a son of the Titan Hyperion, and of Theia or Euryphaëssa, and is described by the same poet as giving light both to gods and men. He rises in the east, from the marshy borders of Oceanus, into whose dark abysses he also sinks at evening. The later poets, however, gave him a splendid palace in the east, somewhere below Colchis, and describe him as being conveyed, after the termination of the burning labors of the day, in a winged boat of gold, along the northern coasts of the sea back to Colchis. After the time of Æschylus, he began to be identified with Apollo or Phœbus, but the identification was never fully carried out. His worship was widely spread.

He had temples in Corinth, Argos, Trœzene, Elis, and many other cities, but his principal seat was Rhodes, where a four-team was annually sacrified to him. In addition, it was customary to offer up white lambs or boars on his altars. The animals sacred to him were horses, wolves, cocks, and eagles. Sculpture represents him, for the most part, as riding in his chariot, drawn by four horses.

HE'LIOTROPE, *Heliotropium,* a genus of plants of the natural order *borragineæ* (q.v.); of the section, sometimes made a distinct order, *ehretiaceæ,* the fruit separating only when ripe into four carpels. Many of the species have fragrant flowers. The PERUVIAN HELIOTROPE (*Heliotrope Peruvianum*), a small shrub, seldom more than 2 ft. high, with oblong-lanceolate wrinkled leaves, and small lilac-blue flowers, is in almost universal cultivation for its fragrance, which resembles that of vanilla. The EUROPEAN or COMMON HELIOTROPE (*Heliotrope Europæum*), a native of the south and west of Europe, is an annual with small white, or rarely pale red, flowers. Important healing powers were once erroneously ascribed to it in cases of cancerous and scrofulous sores; it is, however, astringent and mucilaginous. Many hybrid heliotropes are now to be seen in flower-gardens and green-houses, exhibiting great variety in the size and color of their flowers. They delight in a rich, light soil. The shrubby kinds are generally propagated by cuttings. Large quantities of the flowers are used by perfumers for making scents. Classical fable accounts for the name heliotrope (Gr. *helios,* the sun, and *trepo,* to turn), by representing Clytia as turned into this flower through gazing at Apollo.

HELIOTROPE, or BLOODSTONE, a variety of chalcedony or of jasper, of a green color with red spots. The finest heliotropes consists of chalcedony, and are translucent, at least at the edges; the jasper bloodstones are opaque. Heliotrope is found in many parts of the world, as in Scotland, but the finest specimens of this mineral are brought from the southern parts of Asia. It is well known to the ancients, who obtained it chiefly from Ethiopia and Cyprus. It is much used for boxes, seals, etc.; and those specimens are most valued in which the ground color is beautiful, and the spots bright and well distributed. It was much used in the early ages of the Christian church for the engraving of sacred subjects, the figures being so managed that the red spots should represent drops of blood. Different accounts are given of the origin of the name heliotrope.

HELIOTROPE AND HELIOSTAT, names applied to instruments used by surveyors for rendering distant stations distinctly visible. This is managed by placing a mirror at the distant station, and adjusting it so that at a particular hour of the day (arranged beforehand), the light of the sun shall be reflected from the mirror directly to the surveyor's station. The surveyor must make his observation almost at the instant he sees the glancing of the mirror, as the constant change of the sun's position in the heavens produces a corresponding change in the direction of the rays reflected by the mirror. Gauss (q. v.) invented such an instrument about 1821, which is used abroad, especially in America, for geodetic surveys, and is said to possess such power, that a mirror 1 in. square is visible 8 m. off, in average sunny weather, and appears as a brilliant star at a distance of 2 m.; while some heliotropes have been used so powerful as to be visible nearly 80 m. off. The term heliostat, applied by capt. Drummond to an instrument invented by him for the same purpose, more properly belongs to an instrument invented by S'Gravesande, consisting of an equatorial revolving on its polar axis, so that the sun, when once accurately in the focus of the telescope, continues *steadily fixed* there. Drummond's heliostat is chiefly used in Britain.

HELIOTYPOGRAPHY (otherwise *photoheliography;* from Gr. *helios,* the sun.) Mr. De la Rue, in the observatory at Kew, has produced, on sheets of paper, pictures in which the solar spots are represented without the aid of drawing or engraving of any kind. In one form of operation (noticed in the *Proceedings* of the Royal astronomical society), the sun's spots were viewed through a Newtonian reflector of 18-inch diameter, and 10 ft. focal length, producing an image that would have made the sun's disk 3 ft. diameter. By a nice adjustment, the image of a portion of the disk was received on a glass plate rendered sensitive by collodion. The first part of the process was then complete—the sun painting a picture of his own spots on a piece of glass. Then came the transfer of this negative to a positive, by the usual photographic means of printing, but with a varnish of very complex chemical nature on the positive plate. This completed the second stage—photography producing a very faint picture on the positive plate. Then came chemistry; by dissolving away certain constituents of the varnish, which had been more affected than the rest by the actinic force of the sun's light, the surface of the positive plate became a series of ridges and hollows, *relievi* and *intaglie,* extremely minute in their differences of level, but still sufficiently marked to convey the notion of a kind of engraving. Next came electrotype, or galvanography. The plate, in the state just described, served as a matrix or foundation on which an electrotype cast could be taken. By Pretsch's process, this cast may be so varied as to be available either for surface-printing or for printing on the copper-plate plan. Other solar phenomena, such as the corona, and the appearance presented during annular and total eclipses, have been made to reproduce themselves in a similar way. See also PHOTOGRAPHIC ENGRAVING and PHOTOGRAPHY.

HELIX, in architecture, a spiral form, as when a flight of steps winds round a cylindrical space or center post. The name is also given to the little volutes under the flowers of the Corinthian capital.

HELL (Heb. *Sheol*, Gr. *Hades*, Sax. *Hell*, Ger. *Hölle*), originally a cavern or deep and dark abyss, and sometimes applied (as Gen. xxxvii. 35; Job xiv. 13) to the grave, is commonly used to signify the place, or the condition after death, of the souls of those who, having failed during life to fulfill the essential obligations imposed by the natural or the positive divine law, are consigned to a state of punishment or purgation. With the same unanimity which has existed as to a state of reward after death (see HEAVEN) almost all the various religions, whether ancient or modern, number among their most prominent doctrines the belief of a state of punishment after death—the nature of which is variously modified according to the peculiar tenets of each religion—for unexpiated guilt. Among early Christian writers, the word hell is variously employed, sometimes to signify a place of temporary purgation, in which sense it comprehends the Roman Catholic purgatory (q. v.); sometimes the place (*limbus patrum*) in which the souls of the just of the old law awaited the coming of Christ, who was to complete their felicity; sometimes the place in which unbaptized children are believed to be detained, on account of the stain of unremitted original sin; and lastly, the prison of those who die stained with the personal guilt of grievous sin. Many controversies, which would be entirely out of place here, have arisen about the details of this doctrine, as to the place, the nature, and the duration of the punishment of hell. It will be enough to say that, although according to the literal sense of more than one passage of Scripture, and the popular notions of the various Christian communities, the place of hell would seem to be assigned to the interior abysses of the earth, or to the depths of the intermundane spaces, yet even the formularies of the Roman Catholic church, with all their rigorous precision of detail, and still more those of other communions, have abstained from any formal declaration as to the locality of the punishment of the damned. As to the nature of the punishment to which they are subjected, whether it is confined to the "pain of loss"—that is, to the remorseful consciousness of having forfeited the presence of God, and the happiness of heaven—or whether and to what degree it further includes the "pain of sense," there is some difference between the eastern and the western churches, and it is sometimes alleged that the eastern church altogether rejects the idea of punishment of sense. This, however, is a mistake; both churches agree that the punishment of hell includes the "pain of sense," the controversy between them having regarded not the existence of the pain of sense, but certain questions as to its nature, and especially whether it consists of material fire, a point which, in the decree for the union of the Greek and Latin churches at the council of Florence, was left undecided. The controversy on the subject of the eternity of the punishment of hell dates from an early period, Origen and his school having taught that the punishment of hell was but purgatorial in its object; that its purifying effect having once been attained, the punishment would cease for all, even for the devils themselves; and that its duration in each case is proportioned to the guilt of the individual. This doctrine of the final restoration of all to the enjoyment of happiness, was the well-known Origenistic theory of the *apocatastasis*, to which so many of the early writers refer. It was rejected, however, by the common judgment of antiquity, and was formally condemned by the second council of Constantinople—a condemnation founded on the literal sense of many passages of the Scripture (see Matt. xviii. 8; xxv. 41 and 46; Mark ix. 43; Luke iii. 7; 2 Thess. i. 9; Apoc. xx. 10, etc.); and in the controversies between the eastern and western churches, on the subject of the punishments of hell, the belief of their eternity, in the most strict sense of the word, was always recognized as a common doctrine of both. In the New Testament, the name *Gehenna* is frequently used to designate the place of punishment of the damned (see Matt. v. 22, 29, 30; x. 28; xviii. 9; xxii. 13; Mark ix. 43; Luke xii. 5; James iii. 6). The latter word, indeed, unlike the Hebrew *sheol* and the Greek *hades*, is never found in any other signification than that of the place of punishment of the sinner after death.

HELL, MAXIMILIAN, 1720-92; b. Hungary; a Jesuit and an astronomer. While in Vienna he studied at the observatory, and at a later period was professor of mathematics in the university of Klausenburg, and afterwards director of the Vienna observatory until his death. He was the author of two works on astronomy.

HELLADOTHERIIDÆ (Gr. "Greek wild beast"), a family of mammals which has been established for an extinct animal found in the miocene formation near Athens. It resembled the giraffe in its high shoulders and neck, which latter, however, was shorter than the giraffe's; and also the antelope in the proportion of its limbs. It was of very great size. The molar teeth were broad, and the plates of enamel on their grinding surfaces were simple curves. The skull shows no signs of having been horned. Generic name, *Helladotherium*.

HELLANICUS, a Greek logographer, or reporter, b. Mytilene, in the 5th c., B.C. As a historian he was greatly in advance of preceding logographers. Not content with repeating the traditions that had gained general acceptance through the poets, he tried to produce them as they were locally current, and availed himself of the few national or priestly registers that presented something like contemporary registration. Thus, in

the first place, he gave in many points accounts quite different from the usual beliefs, e.g., he recorded the local belief in the troad that Troy had not been wholly destroyed by the Greeks, but had continued to exist to his own time; and in the *Atthis*, touching on Spartan affairs, he made no reference to Lycurgus, but attributed the Spartan constitution to Eurysthenes and Procles. Now, it is certain that the Spartan state registers could not have made any mention of Lycurgus on account of the plan on which they were framed. Secondly, Hellanicus laid the foundations of a scientific chronology, though his materials were insufficient, and he often had recourse to the usual rough reckoning by generations. On account of his deviations from common tradition, Hellanicus is often called an untrustworthy writer by the ancients themselves, but probably few authors would have been more useful to a scientific student if his works had been preserved.

HEL'LAS, the original home of the Hellenes, according to the received opinion, was first a town, and afterwards, under the name of Phthiotis, a well-known district of Thessaly. The ancients also sometimes applied this name to the whole of Thessaly. With the spread of the Hellenic people southwards, the term embraced a gradually increasing territory, until it came to denote the whole of middle Greece or Greece proper (modern *Livadia*). At a still later period, the Peloponnesus itself was included under the designation; and finally, Hellas came to be used in the broadest sense, as comprehending the whole of Greece, with its islands and colonies.—The HELLENES, or Greeks, as distinguished from the more ancient Pelasgians, received this name in the belief that they were descended from a certain Hellen. This mythical personage, a son of Deucalion and Pyrrha, or, according to others, of Zeus and Dorippe, and the father of Æolus, Dorus, and Xuthus, was said to have been king of Phthia, and to have ruled over all the country between the rivers Peneius and Asopus.

HELLE, in Greek mythology, a daughter of Athamas, king of Thebes in Bœotia, and the goddess Nephele whom he had married at the command of Hera. The king was secretly in love with Ino, a mortal, and married her. The family dissensions soon became so violent that he consulted a Delphic oracle, where the priestess (bribed by Ino) told him that he must sacrifice Prixus, the brother of Helle. To save her children Nephele dispatched them to Colchis on the back of the ram with the golden fleece; but while crossing a strait Helle fell off and was drowned. The strait was named the Hellespont or sea of Helle.

HELLEBORE, a name applied to two very different genera of plants. The genus to which it more properly belongs, and to which it has belonged, since very ancient times, *hellebŏrus*, is of the natural order *ranunculaceæ*, and is characterized by a calyx of 5 persistent sepals, often resembling petals; a corolla of 8 or 10 very short, tubular, honey-secreting petals; numerous stamens and 3—10 pistils; a leathery capsule, and seeds arranged in two rows. The species are perennial herbaceous plants, mostly European, generally with a short root-stock; the stem mostly leafless, or nearly so, but sometimes very leafy; the leaves more or less evergreen, lobed, the flowers terminal. A familiar example of this genus is the BLACK HELLEBORE—so called from the color of its roots—or CHRISTMAS ROSE (*H. niger*), a favorite in our flower-gardens, because its large white flowers are produced in winter. The leaves are all radical; the stalks generally one-flowered; the flowers white or tinged with red. Black hellebore formerly enjoyed a higher reputation as a medicinal agent than it now possesses. Melampus is represented as employing it in the treatment of madness centuries before the Christian era. The root is the part used in medicine, and it is imported into this country from Hamburg, and sometimes from Marseilles. It consists of two parts—the rhizome or root-stock, and the fibers arising from it. The former is nearly half an inch thick, several inches long, and knotty, with transverse ridges and slight longitudinal striæ; the latter are numerous, cylindrical, brown externally, and whitish internally. The taste is slight at first, then bitter and acrid. The chemical composition of the root is not very accurately known. It is not much employed at the present day, but it has been found of service (1) in mania, melancholia, and epilepsy; (2) as an emmenagogue; (3) in dropsy—its action as a drastic purgative, and its stimulating effect on the vessels of the liver, rendering it useful; (4) in chronic skin diseases; and (5) as an anthelmintic. Ten or fifteen grains of the powdered root act as a sharp purgative. The tincture, which is obtained by maceration in spirit, is usually given when its action as an emmenagogue is required. In an excessive dose, it acts as a narcotic acrid poison, and causes vomiting, purging, burning pain in the stomach and intestines, faintness, paralysis, and death.—STINKING HELLEBORE (*H. fœtidus*) grows on hills and mountains in the south and west of Europe, in some of the chalk districts of England, and in several places in Scotland. It has a very disagreeable smell, and green flowers somewhat tinged with purple. The stem is many-flowered and leafy.—GREEN HELLEBORE (*H. viridis*), also found in the chalk districts of England, has a leafy stem, with a few large greenish-yellow flowers. The celebrated hellebore of the ancients was probably a species peculiar to Greece and the Levant, *Helleborus orientalis* or *Helleborus officinalis;* all the species, however, have similar medicinal qualities. From the abundance of the plant around the city of Anticyra, hypochondriacal persons were said to need a visit to Anticyra.—Closely allied to the genus *helleborus* is *eranthis*, in which the flowers are

surrounded with an involucre, and have a deciduous calyx. A well-known species is the WINTER HELLEBORE, or WINTER ACONITE (*E. hyemalis*), of our gardens, whose yellow flowers, raised only a few inches above the ground, deck the flower-border about the same time with snowdrops. It is a native of the midland parts of Europe, but naturalized in many parts of Britain. It loves shady places.

WHITE HELLEBORE (*Veratrum album*) belongs to the natural order *melanthaceæ*. The genus has polygamous flowers, with 6-leaved perianth, 6 stamens, 3 pistils cohering at the base, a 3-horned capsule separating into 3 many-seeded follicles, and compressed seeds winged at the apex. White hellebore has a leafy stem, sometimes 4 feet high, ovate-oblong leaves, a long terminal compound panicle, and yellowish-white flowers. It abounds in the mountains of the center and south of Europe, but is not found in Britain. The root was once much used in medicine, but now rarely, although it seems to act powerfully in some diseases. It is a very acrid and active poison. Its powder is used to destroy lice, and by gardeners for killing caterpillars. A decoction and ointment of it are sometimes used in itch and ringworm. Caution is necessary even in handling the powder of white hellebore, and very unpleasant effects ensue from its getting into the eyes or nose.—AMERICAN HELLEBORE, or SWAMP HELLEBORE (*V. viride*), known also as Indian poke or itch weed, is frequent in damp grounds from Canada to Carolina Its root has properties similar to those of white hellebore. These properties seem to depend chiefly on an alkaloid called *veratria*.

HELLEN, in Greek tradition the son of Deucalion and Pyrrha, the survivors of the deluge. Hellen had three sons, Dorus, Æolus, and Xuthus; and from Dorus, Æolus, and two sons of Xuthus, the four great branches of the Greek people; while the Greeks collectively are called Hellenes after Hellen.

HEL'LENIST (Gr. *Hellenistes*), the name given to those among the Jews, and afterwards in the Christian church of Judea, who, either by birth or by residence, and by the adoption of the Greek language, manners and usages, were regarded as Greeks, in opposition to the Hebrews properly so called, whether of Palestine or of the dispersion. The name has sometimes been improperly restricted to persons of Greek parentage or descent; but like other Gentile names of the same form, it marks a class distinguished by the peculiar habits and language of Greece rather than by Greek descent. The Hellenists, in this sense, formed a distinct body, and stood in a relation of rivalry, if not of antagonism to the Hebrews (see Acts vi. 1. and ix. 29). There is also a clear distinction between Hellenes (Greeks—from Hellas, q.v.) and Hellenists. The latter might, it is true, be Hellenes by birth, but the prominent idea conveyed by the name was rather the adoption or affectation of Greek manners and language than Greek parentage or blood.

At the time of our Lord's crucifixion, the Jews of the dispersion were to be found in almost every part of the Roman empire; but it was among the Jews settled in Alexandria that the Hellenizing tendency found its freest development; and it is to that city that we must refer the formation as well of that peculiar dialect of the Greek language which is known as the Hellenistic, as of that singularly acute and speculative philosophy which exercised so large an influence on those early Christian schools, of which Origen is the most famous exponent.

The really characteristic element of the Hellenistic Greek consists in its foreign, and especially its Hebrew and Aramaic words and idioms. Although it was in its origin a purely popular form of the language, yet its being employed in the Alexandrian or Septuagint version of the Old Testament, has given to it all the fixedness and definite character of a written language. The Hellenisms of the Septuagint differ in many respects from those of the New Testament, which again present some points of discrepancy with those of the Alexandrian fathers; but there are certain leading characteristics common to them all, which constitute the distinctive forms of the dialect, and which may also be described as peculiarities of structure and forms of thought derived from those Hebrew or Aramaic idioms which were the native modes of speech of the Greek-speaking Hebrews.

The influence of the Hellenistic modes of thought on the philosophy of the Alexandrian schools will be traced under the head of the NEO-PLATONIC PHILOSOPHY. See Frankel, *Monatschrift* (1855); also Winer, *Grammatik des N. Test. Sprachidioms* (2d edition).

HELLER, STEPHAN, b. Hungary, 1814; German composer; studied in Vienna, and in 1829 made a professional tour in Germany. Since 1838 he has been in Paris. His works are chiefly for the pianoforte, and some critics rank him in this respect above Chopin. He has published more than 150 works.

HEL'LESPONT. See DARDANELLES.

HELLEVOETSLUIS, or HELVOETSLUYS, a well-known fortified seaport of the Netherlands, in the province of South Holland, is situated on the Haring Vliet, an arm of the Maas, on the island of Voorne, 17 m. s.w. of Rotterdam. It has an excellent harbor, as well as an arsenal, docks, and a naval school, and it is one of the principal Dutch naval stations. By means of the new canal of Voorden, leading from the Maas to Hellevoetsluis, and so out to sea, large vessels avoid the shallow bar at the mouth of the Maas. Hellevoetsluis is to Rotterdam and the mouth of the Maas what the Helder is to

Amsterdam and the Zuyder Zee. Here William III. embarked for England, Nov. 11, 1688. Pop. (Dec. 31, 1874,) 4,162.

HELL GATE, or HURL GATE, named by the Dutch settlers of New York, *Helle Gat*, is a pass in the East river, between Great Barn island and Long Island, e. of the center of New York island, United States, formerly very dangerous to vessels from its pointed rocks and whirlpools. During 1869–76, extensive submarine galleries and tunnels were excavated in the rock for the purpose of receiving a gigantic charge of dynamite (50,000 lbs.), which was fired by electricity on Sept. 24, 1876, and completely broke up the obstructing rocks.

HELL GATE (*ante*) IMPROVEMENTS. Hell Gate may be more particularly described as that part of the East river between Long island and Manhattan island, also between Long island and Ward's island, and between Ward's island and Manhattan island. (Little Hell Gate is an unimportant small passage between Ward's island and Randall's, lying to the n. and having a transverse direction). The reefs of rock in the main passage, some of which were islands at low tide, caused with the rising and falling of the tide numerous whirlpools and eddies, which rendered navigation at times really dangerous, always difficult; and for large ships impossible, although the depth in the tortuous channel might be sufficient.

A survey was made as long ago as 1848 by (then) lieut.-commanding Charles H. Davis and David Porter, of the U. S. navy, and in their reports they recommended the destruction by blasting of Pot rock, Frying pan, and Way's reef, which lie between Long island and Ward's island. Lieut. Davis proposed also to clear the middle channel, between Long island and Manhattan or New York island, and immediately below Ward's island, which contains Little Mill rock, Great Mill rock, Middle reef, Heel Tap rock, and others; but lieut. Porter advised rather the destruction of a part of Hallett's point, which, in connection with Ward's island, turns the current in the east channel toward Manhattan island, forcing it against the current of the w. channel at right angles. The destruction of the whole of Hallett's point would allow the two currents to meet at a very small angle, but such an operation, it was thought, would require altogether a greater outlay than would be practicable, and the advantages would be slight, because the usefulness of both shores of the river requires the removal of the middle obstructions.

The science of submarine blasting as now understood, had no existence at that time. Where the currents in a stream allowed of the operation, diving-bells were often used as a means of drilling and blasting, but the fierce currents of Hell Gate precluded this method. Physics had taught that the inertia of liquids and even gases could be made available as a reacting force, in mechanical operations, if the primary force or impulse were approximately instantaneous; indeed, ordinary mathematical reasoning leads to this conclusion. The idea of using superjacent water as a "tamping" by simply igniting the explosive upon the surface of the rock was first successfully put into practice by M. Maillefert, with whom a contract was made to remove obstructions in Hell Gate, the money, $14,000, being raised by citizens of New York. He commenced work in Aug., 1851, by a process which consisted in letting down a can of gunpowder on the surface of the rock and exploding it by means of the galvanic current. The can, as a rule, contained about 125 lbs. of gunpowder. He operated upon Pot rock, Frying pan, Way's reef, Shelldrake, Bald-headed Billy, Hoyt's rocks, Diamond reef, and Hallett's point reef. Upon the latter, however, he produced no sensible effect. He reduced the most prominent surfaces of these rocks to an average depth of about 16 ft.; some to 18 ft. depth; one, Way's reef, only to 14. These rocks were originally from 5 to 15 ft. below lowwater mark. He fired in all 620 charges, 284 being upon Pot rock. Bald-headed Billy was blown into deep water with one charge. Six charges, having an aggregate of 750 pounds of powder, and a cost of only $500, deepened Shelldrake from 8 to 16 feet. Other rocks gave more trouble, the deepening of Pot rock from 8 to 18.3 ft. requiring over 34,000 pounds of powder, and costing $6,837.

Congress, in 1851, appropriated to the work $20,000, and of this $18,000 went toward lowering Pot rock to a depth of 20 ft., under the direction of maj. Fraser; the great cost of lowering only two additional feet being in consequence of the considerable increase of surface, and the smoother condition of it. The method was by surface blasting as has been practiced by M. Maillefert. In 1856 it was recommended by the advisory council to the commissioners to further deepen the rocks in Hell Gate, and by the method not of surface blasting, but of drilling. Their statement that this could be easily effected is somewhat remarkable when it is considered that no method of drilling had up to this time been employed, except by use of the diving-bell, impracticable in Hell Gate. Nothing, however, was done until 1866, when brevet maj.gen. John Newton of the U. S. engineers, was ordered to make a survey, the report of which he made to congress in 1867. He proposed the construction of a drilling scow which should be securely moored at the site of operations. A dome made of strong boiler iron, of a hemispherical shape, 30 ft. in diameter, served as a framework for 30 drill tubes. This dome rested upon self-adjustable legs, and was let down to the surface of the rock from amidships of the scow. The self-adjustable legs allowed it to settle in a firm and unmovable position, as regarded the action of the current. The machine was not com-

menced till July, 1869, owing to want of funds. It was constructed, and put into operation on Diamond reef, near the mouth of the East river, in May, 1871. Coenties reef was also operated on with this scow in alternation with the work on Diamond reef. These operations proving satisfactory, the machine was taken to Hell Gate, and 17 holes were drilled into Frying pan rock in July, 1872. Also 11 surface blasts were made. In Aug. of the same year the scow was put to work on Pot rock, where it remained until the close of the year. During this time there happened some sixteen collisions with passing vessels, which caused much delay, so that it was deemed proper to surrender the work until more efficient regulations could be had in regard to pilots. However, during the five months' work on Pot rock, 40 holes were drilled and blasted, and 60 seam blasts and 24 surface blasts were made. The débris had to be removed by divers during slack water. On account of the rapidity of the current at any other time, Way's reef, which had been reduced to a depth of 14 ft. in 1857, and again in 1869 to 17½ ft. by surface blasting, was attacked by the drilling scow in Aug., 1874, and by the end of Jan., 1875, it was reduced to a depth of 26 ft., at mean low water. This rock was 235 ft. long by a maximum width 115 feet. There were 262 holes drilled, having an aggregate depth of 2,130, or an average of a little more than 8 ft. for each hole. The explosives used were over 15,000 pounds of nitro-glycerine for drill blasts and about 1500 pounds for surface blasts; also, 38 pounds of dynamite.

Of the operations which have been completed, those upon Hallett's point reef are by far the most extensive. Hallett's point, the site of fort Stevens, is a considerable peninsula, projecting into the East river immediately above Astoria. The reef, which was dangerous to vessels, ran along the shore about 720 ft., and projected about 300 ft. into the river. This immense mass of rock was removed by tunneling, a process first proposed by Mr. G. C. Reitheimer, and soon after by gen. Alexander of the U. S. engineers, and Mr. A. W. Von Schmidt, C.E., to whom was given the contract for removing Blossom rock in San Francisco harbor, the first operation of the kind ever performed. See SAN FRANCISCO. Blossom rock was, however, of less size than Way's reef, being only 180 by 100 ft. in area, while the latter was 235 by 195 at its greatest breadth. This, as described above, was removed partly by surface blasting, and partly by surface drilling, but at less cost than for removal. For the removal of the reef at Hallett's point, a coffer dam in the form of an irregular pentagon of 140 ft. greatest diameter was erected on the shore, and in this there was sunk a shaft having a diameter of 105 by 95 ft., and a depth of 33 ft. below mean low water. From this shaft diverging tunnels were excavated in the rock, which is a tough gneiss, with nearly a perpendicular dip (the character of all the rock in Hell Gate). As these tunnels extended they were connected by transverse galleries, and afterwards new diverging tunnels, commencing in the galleries were commenced and extended. There were eight concentric galleries, with the addition of two additional partial ones at the periphery, the whole number of tunnels being 35. The mouths of the tunnels were from 17 to 22 ft. high and 12 to 9 ft. wide, but diminishing quite rapidly to keep under the floor of the river. The galleries, which were about 25 ft. from center to center, also varied in height for the same reason. The lineal measure of the tunnels and galleries was 7,425 ft., and the whole area embraced was 2⅝ acres. The ordinary processes now in use for tunneling or excavating rock were employed. See TUNNEL. The mass of rock included in the scope of operation is said to have been something over 110,000 cubic yards; the number of cubic yards of rock removed from the tunnels and galleries being computed to be 47,461 cubic yards. After the excavation was completed, holes were drilled into the piers, which were left standing between the tunnels and galleries, supporting the roof, and also into the roof, and charged with nitro-glycerine held in cans into which the electrodes of a galvanic battery were introduced. Water was let into the mine by a siphon into the shaft the day previous to the explosion, which took place on Sunday, Sept. 24, 1876. It is proper here to state, that the blasting was done on this day, notwithstanding there were protests, because of a delay in the delivery of the explosives, and the charging having been completed, gen. Newton was unwilling to endanger the lives of his men by delay. The time of the explosion was 2 h. 57 m. P.M., at high tide. It lasted about three seconds, the vibration of the earth being slight, but perceptible to a considerable distance. No damage was done to property. The nitro-glycerine used was contained in the following compounds: Dynamite, 28,901 pounds; rend-rock powder, 9,061; vulcan powder, 14,244; making a total of 52,206 pounds, or more than 25 tons. This was contained in 13,596 cartridges. The number of charged holes was 4,427; they were from two to three inches in diameter, with an average depth of 9 ft., and averaged about 8 ft. apart. They were all connected by about 100,000 ft. of wire, and the blasts were exploded by 64 batteries having an aggregate of 960 cells. Three cartridges were usually placed in a cell, with a priming of dynamite which was exploded by the percussion of fulminate of mercury, connected with the voltaic arc. The success may be said to have been perfect. The blasting at first, or before 1874, was principally with pure nitro-glycerine. Afterwards "mica powder," "giant powder," "rend-rock," and "vulcan powder," were used, and although having less power, were found more effective and economical. The amount appropriated by congress between 1868 and 1876 was $1,940,000, of which nearly $1,717,000 was expended upon the operations at Hallett's point.

HELLIN', a t. of Spain, in the province of Albacete, and 40 m. s.s.e. of the town of that name, is situated in a hilly district near the eastern bank of the Mundo, a tributary of the Segura. Its houses are for the most part neatly painted, and, unlike most Spanish towns, it has an air of comfort and cleanliness. In the vicinity are productive royal sulphur mines. Pop. 10,200.

HELLMUTH, ISAAC, D.D., was by birth a Pole and belonged to a Jewish family. Becoming a convert, he entered the Anglican ministry and proceeding to Canada entered upon the duties of his profession. He founded Huron college in 1863, and six years later, at London, Ont., the college and ladies' seminary which bear his name. In 1871 he succeeded to the bishopric of Huron.

HELM, in nautical affairs, denotes the entire steering apparatus of a ship. This apparatus consists of three distinct portions—the rudder, the tiller, and the wheel; although in boats and small vessels the wheel is ordinarily dispensed with. The rudder is the instrument acting directly upon the water, and its mode of action and form will be described under rudder (q.v.). The tiller is a lever, formed into a handle, by means of which the steersman can greatly multiply on the rudder (the position of which is almost identical with the fulcrum, the hinges) the power he exerts against the long end of the tiller. The wheel is an ordinary wheel and axle, moving the long end of the tiller from side to side by the agency of ropes, again multiplying the power, and being otherwise convenient as occupying a smaller space on the upper deck than the long tiller would have taken. To "starboard the helm" is to put the tiller so as to carry the rudder to port; "port the helm," the converse. To "put up the helm," is to let the ship go more fully from the wind; while to "put down the helm," is to exercise a contrary effect.

HELMET, a covering of metal or leather to protect the head in warfare. The earlier Greek and Roman helmets, as shown in many extant sculptures, were surmounted by plumes, but unlike their modern successors, did not protect the face. During the middle ages, helmets were made of the finest steel, often inlaid with gold, and provided with bars and flaps, to cover the face in action, and to allow of being opened at other times. As the employment of firearms became more general, helmets naturally lost their utility, especially as regarded the face. Those still remaining are in military matters limited for the most part to heavy cavalry, afford no protection to the face, and must be considered as rather for ornament than use. Firemen wear a heavy head-piece of leather and brass, to protect them as far as possible from falling ruins at conflagrations In India and other hot climates, helmets of white felt, with the additional screen of rolls of linen, are constantly worn by military men, to protect them from the rays of the sun.

HELMET, in heraldry. From the early simple form known as the Norman, the helmet, at a later period, came to vary in shape according to the degree of the person who wore it, and helmets were set over coats of arms to bear the crest, and indicate by their form the rank of the bearer. The part of the helmet which opens to show the face is called the *visor* or *beaver* (to allow of drinking). The following forms of helmet are in use in English heraldry: 1. The helmet assigned to the king and princes of the blood-royal which is full-faced, composed of gold lined with crimson, and has the vizor divided by six projecting bars. 2. The helmet of the nobility, of steel, with five bars of gold. When placed on the shield, it is exhibited in profile. 3. Knights and baronets have the full-faced steel helmet with the vizor thrown back and without bars. 4. The helmet of esquires, always represented in profile, of steel with the vizor closed. These distinctions are of comparatively recent date. A much greater variety of helmets is in use in continental heraldry. A helmet is never placed over the arms of any woman except the sovereign.

HELMET-SHELL, *Cassis*, a genus of gasteropodous mollusks of the family *buccinidæ;* the animal much resembling the common whelk (q.v.), with which it also nearly agrees in habits; the shell swollen, rather thick and solid, with bold ridges, a short spire and a long aperture, the outer lip toothed, the canal recurved. The species, which are pretty numerous, are all natives of tropical seas. Most of them are beautiful; and they are used by engravers for making cameos, the differently colored layers producing exquisite effects when skillfully cut.

HELMHOLTZ, HERMANN, one of the most distinguished scientific men of the present day, was born at Potsdam in Aug., 1821. He was at first a surgeon in the army, then assistant in the Berlin anatomical museum, and was a professor of physiology, from 1849 at Königsberg, from 1855 at Bonn, and from 1858 at Heidelberg. In 1871 he became professor of physics in Berlin. Helmholtz is equally distinguished in physiology and in experimental and mathematical physics. His physiological works are principally connected with the eye and the nervous system. Thus, we have his exhaustive treatise on *Physiological Optics;* his *Speculum for the Examination of the Retina;* his *Discourse on Human Vision;* and various papers on the means of measuring small periods of time, and their application to find the rate of propagation of nerve disturbances. Of a semi-physical nature, we have his *Analysis of the Spectrum;* his *Explanation of Vowel Sounds* (*Klangfarbe der Vocalen*, see SOUND); and his papers on the

Conservation of Energy with Reference to Muscular Action. In physical science, he is known by his paper on *Conservation of Energy* (*Ueber d. Erhaltung d. Kraft*, 1847, translated [badly] in Taylor's *Scientific Memoirs*, new series); a popular lecture on the same subject (1854); by two memoirs in Crelle's *Journal*, on *Vortex-Motion in Fluids;* and on the *Vibrations of Air in Open Pipes*, etc. His *Populäre wissenschaftlichen Vorträge* appeared in 1865–76.

HELMINTHOL'OGY (Gr. *helmins*, a worm, and *logos*, a discourse) is a term formerly used to denote the science of the natural history of worms generally, but now restricted to the red-blooded worms, such as the medicinal leech and earth-worm.

HEL'MOND, a t. in the Netherlands, province of North Brabant, lies 21 m. s.e. from Bois-le-Duc, on the Aa and South Willemsvaart. It has a good haven. The principal industries are the manufacture of cotton, woolen, and linen fabrics, cotton-printing, dyeing, calendering, beer-brewing, etc. The pop. is nearly 7,000.

HELMONT, JAN BAPTISTA VAN, Lord of Merode, Royenborch, Oorschot, and Pellines, an eminent Belgian chemist, was b. at Brussels in 1577, and d. near Vilvorde in 1674. He went through the regular course of study at the university of Louvain, and on the completion of his education, he was offered and accepted the chair of surgery in that university, the duties of which he discharged for two years. The study of the works of Paracelsus seems to have turned his special attention to chemistry and natural philosophy, and in the pursuit of these sciences he spent several years in the different universities of Italy and France; after which he returned home, married Margaret van Ranst, a noble lady of Brabant, and settled down at his estate near Vilvorde, where he spent the remainder of his life in philosophic investigations of various kinds. It would be impossible, in the limits of this article, to sketch even an outline of his chemical discoveries. Writers of the history of chemistry regard him as the greatest chemist who preceded Lavoisier; and it is much to be regretted that his language is often so obscure, that it is not always easy to ascertain his meaning. He was the first to point out the imperative necessity for employing the balance in chemistry. He paid much attention to the study of the gases, and is supposed by some authorities to have been the first to apply the term *gases* to elastic aeriform fluids. Of these gases he distinguished several kinds. He was also the first to take the melting-point of ice and the boiling-point of water as standards for the measurement of temperature. By means of the balance he showed, in many instances, the indestructibility of matter among chemical changes. For example, he demonstrated that a salt dissolved in water, or silver dissolved in aquafortis, could be recovered unchanged in quantity. It is in his works that the term *saturation* is first employed, to signify the combination of an acid with a base; and he was one of the earliest investigators of the chemistry of the fluids of the human body.

Along with other physiologists of his day, he speculated much on the seat of the soul, which he placed in the stomach. His reasons are chiefly these two: 1. It cannot exist in the brain, because that organ contains (according to Helmont) no blood; 2. It does exist in the stomach, because when we hear bad news, we lose our appetite. Those who wish to know the full value of his contributions to the knowledge of chemistry, may consult the *Histories of Chemistry* written by Kopp and Höfer.

The most important of his works is his *Ortus Medicinæ, id est initia Physicæ inaudita, progressus Medicinæ novus in morborum ultionem ad vitam longam*, which was published by his son four years after his death, passed through a very large number of editions, and was translated into Dutch, French, German, and English. A very curious volume, containing translations of some of his works, was also published by W. Charlton, in 1650, under the title of *The Ternary of Paradoxes; the Magnetic Cure of Wounds; the Nativity of Tartar in Wine; and the Image of God in Man.*

HELM'STEDT, a t. in the n. of Germany, in the duchy of Brunswick, 22 m. e.s.e. of the city of that name, was formerly famous for its university, founded here by Julius, duke of Brunswick, in 1575, and suppressed by Jerome Bonaparte in 1809. The university buildings now serve as court-houses. Manufactures of flannel, soap, hats, and grain-spirits are carried on. Here the first Saxons were baptized by St. Ludgarus. Pop. '75, 7,783. Helmstedt was formerly a member of the Hanseatic league.

HELMUND', a river of Afghanistan, rises 35 m. to the w. of Cabul, at an elevation of 11,500 feet. After a south-westerly course of about 650 m., it loses itself in the salt lake of Seistan or Hamoon by several mouths, about lat. 31° 30′ n., and long. 62° east. The immediate banks, generally bordered by deserts on either side, abound almost everywhere with traces of former cultivation and wealth. Like tropical rivers in general, the Helmund varies largely in volume according to the season, being, in many places, thrice as deep and broad in the rainy season as it is at other times.

HELODERMIDÆ (Gr. *helos*, a nail, and *derma*, skin—nail-skinned), a family of saurians of the group *diploglossæ*, differing from other members of the group by having scales resembling nails over a great portion of the skin; temporal fossæ overarched by skin ossification. They have no premaxillary foramen, and the teeth have short, dilated bases, anchylosed obliquely; mesosternum longitudinal, without lateral limbs; color,

dark, almost black; reticulated spaces between the scales, yellow. It has the name of *scorpion* in southern Arizona. The family was established by Gray and Cope, 1864–66.

HELOISE. See ABELARD.

HELOS, in ancient geography the name of several towns, so called because they were on or near fens. The most important was in Laconia, at the mouth of the Eurotas, in a marshy but fertile plain near the sea. When the Dorians conquered the Peloponnesus they carried the Helots, the inhabitants of Helos, to Sparta as slaves.

HEL OTS. The population of ancient Sparta was divided into four classes, the lowest of which was formed of serfs or slaves, called Helots (probably meaning *captives*, from Gr. *helein*, to capture). These Helots are generally supposed to have formed the original population of the country, and to have been reduced to bondage by their Dorian conquerors, the numbers, however, being swelled from time to time by the conquest of enemies. They belonged to the state, which had the power to set them at liberty; but they toiled for individual proprietors, and were *bound to the soil*, i.e., they could not be sold away from the place of their labor. They were the tillers of the land (for which they paid a rent to their masters), they served at the public meals, and were occupied on the public works. In war they served as light troops, each freeborn Spartan who bore heavy armor being accompanied to battle by a number of them, sometimes as many as seven. On rare occasions they were used as heavy armed soldiers. It is a matter of doubt whether after emancipation they could ever enjoy all the privileges of Spartan citizens. They were treated with much severity by their masters, and were subjected to degradation and indignities. They were whipped every year, to keep them in mind of their servile state; they were obliged to wear a distinctive dress (clothes of sheepskin, and a cap of dog's skin), and to intoxicate themselves, as a warning to the Spartan youth; and when multiplied to an alarming extent, they were often massacred with the most barbarous cruelty. On one occasion, 2,000 of them, who had behaved bravely in war, were encouraged to come forward for emancipation, and were then most treacherously put to death. The Spartans organized, as often as necessity required, *secret service companies* (Gr. *crypteia*) of young men, who went abroad over the country armed with daggers, and both by night and day assassinated the unfortunate Helots, selecting as their special victims the strongest and most vigorous of the oppressed race.

HELPS, Sir ARTHUR, K.C.B., an English essayist and historian, was b. about 1817; and was entered at Trinity college, Cambridge, where he took the degree of A.B. in 1835. On leaving the university he obtained a post in the civil service, and on his resignation, he retired to Bishop's Waltham, in Hampshire, where, in the possession of ample means, he enjoyed lettered ease. His first work of consequence, entitled *Essays Written in the Intervals of Business*, appeared in 1841. It was followed by two dramas, *Catherine Douglas*, and *King Henry the Second* (published in 1843); by an essay on the *Claims of Labor* (1844); and by *Friends in Council* (1847–49). This last work has been, and still is, much admired by the selecter class of readers, and has gone through many editions. His *Conquerors of the New World and their Bondsmen* appeared in 1848, and *Companions of my Solitude* in 1851. Among his subsequent works are—*Oulita*, a play; *The Spanish Conquest in America* (1855–57); *Friends in Council*, 2d series (1859); *Essay on Organization; Life of Pizarro* (1869); *Casimer Maremna*, and *Brevia* (1870); *Life of Hernando Cortes; Thoughts upon Government* (1871); *Life and Labors of Thomas Brassey* (1872); and *Social Pressure* (1874). He was clerk to the privy council, and became a K.C.B. in 1872. He died in 1875.

Helps is the most delightful essayist since Lamb and Hunt. He everywhere exbibits acuteness, humor, a satire which gives no pain, and a quiet depth of moral feeling manifesting itself mainly in an earnest recognition of man's social responsibilities; while his style, in qualities of purity and clearness, can hardly be matched amongst his contemporaries.

HEL'SINGBORG, an ancient fortified seaport t. of south Sweden, 33 m. n.n.w. of the town Malmö, on the sound, opposite Elsinore. Steamers leave Helsingborg almost daily for Copenhagen, Malmö, Elsinore, and other places. There is a good harbor. Earthenware and iron goods are manufactured. Pop. about 6,600.

HEL'SINGFORS, a fortified seaport of Russia, capital of the government of Finland, and after Cronstadt, the most important naval station on the Baltic, is beautifully situated on a peninsula, surrounded by islands and rocky cliffs, in the gulf of Finland, 191 m. w. from St. Petersburg by sea. A series of formidable batteries, called the fortifications of Sveaborg, and consisting of seven strongly fortified islands and numerous islets, protect the entrance to the harbor, and are of such strength, and so well appointed, as to warrant the application to them of the name of the northern Gibraltar. The whole front presented by the successive works is about a mile in length, and, besides the casemates for small arms, the united fortresses mount about 1000 guns, and are garrisoned by 12,000 men. The harbor itself is further defended by two forts. Helsingfors is the largest and handsomest town of Finland; the broad streets, consisting of houses painted externally yellow and green, intersect at right angles, and there are several fine public squares. Of the public buildings, the most striking are the residence of the governor, the senate house, and the university buildings. The university, removed hither from

Abo in 1829, where it had been founded in 1640, comprises four faculties, has 40 professors, and generally about 700 students. In connection with it are a library of 150,000 volumes, a hospital, a botanic garden, and a valuable observatory. Since 1840 Helsingfors has been a favorite bathing-place, and attracts many visitors during summer from St. Petersburg. The town carries on a considerable trade in Baltic produce: it exports chiefly corn, fish, deals, and iron; and manufactures sailcloth and linen. Pop. '70, 32,113, including the garrison.

Helsingfors was founded by Gustavus I. of Sweden in the 16th c., but the site of the town was removed nearer the shore in 1639. In 1819 it became the capital of Finland. During the late Russian war, Sveaborg was bombarded for two days and nights (Aug. 9 and 10, 1855) by a section of the allied fleet, without any material impression being made upon the forts.

HELSINGÖR. See ELSINORE, *ante.*

HELST, BARTHOLOMEW VAN DER, a Dutch painter, was b. at Haarlem in 1613, and d. at Amsterdam in 1670. He attained great celebrity as a portrait painter. One of his works (in the chamber of justice at Amsterdam), representing 30 full-length figures of a train-band with the Spanish ambassador in the midst, was pronounced by sir Joshua Reynolds to be "the first picture of portraits in the world." His "Militia Dinner" is also a splendid piece of art.

HEL'STONE, an old market t. and municipal and parliamentary borough in the county of Cornwall, England, is pleasantly situated on an elevation, at the head of a pretty valley opening to the sea, about 10 m. w.s.w. of Falmouth. It was made a borough by king John in 1201, and from the reign of Edward I. to the passing of the reform act, it sent two members to parliament; since that, one only. May-games, or *floralia,* once common throughout England, are still kept up here. Pop. '71, 8,760.

HELVEL'LA, a genus of fungi, of the order *ascomycetes* (see FUNGI), closely allied to morels, but differing from them in having the *pileus* turned downwards, lobed and olded, and the surface of the *hymenium* even. Some of the helvellæ are edible, and much used in Germany.

HELVEL'LYN, one of the highest mountains of England, in the lake district, Cumberland, between Keswick and Ambleside. It is 3,055 ft. high, is easy of ascent, and commands magnificent views of the surrounding country.

HELVE'TIAN REPUBLIC. See SWITZERLAND, *ante.*

HELVE'TIC CONFESSIONS. See CREEDS AND CONFESSIONS.

HELVE'TII, a Celtic people inhabiting, according to Cæsar, the region between the mountains of Jura on the w., the Rhone on the s., and the Rhine on the e. and n., the region corresponding pretty closely with modern Switzerland. They had 12 towns and 400 villages. The great and fatal event in their history is their attempted irruption into and conquest of southern Gaul, in which they were repulsed by Cæsar with frightful slaughter. The story of this expedition is circumstantially narrated by the Roman commander. They collected three months' provisions, burned their 12 cities, 400 villages, and all isolated dwellings, and made a general rendezvous by lake Leman in the spring of 58 B. C. Cæsar hastened to Geneva, destroyed the bridge, raised two legions in Cisalpine Gaul, and when the Helvetians sent delegates to demand a passage, delayed them until he had built a wall along the Rhone, 16 ft. high and about 19 Roman m. in length, flanked with redoubts. Having vainly attempted to pass this barrier, the Helvetii took another route, but were followed and defeated with a terrible slaughter at Bibracte (modern Autun, in Burgundy), and the remnant obliged to return to their own country, where they became subject to the Romans. Of 368,000 who left their homes, including 92,000 fighting-men, only 110,000 returned. In the commotions which followed the death of Nero, the Helvetians met with another terrible catastrophe. Remaining faithful to Galba, they were fallen upon by Cacina, a general of Vitellius, who gave them to the rapacity of his legions. They were massacred by thousands, multitudes were sold to slavery, and their towns pillaged and burned, their capital destroyed, and their governor executed. From this time they scarcely appear as a distinct people.

HELVE'TIUS, CLAUDE-ADRIEN, sprung from a family of Swiss origin, as the name Helvetius implies, was b. at Paris in 1715, and received a careful education. Intended for a financial career, he was sent, after the conclusion of his studies, to his uncle, D'Armancourt, *Directeur des Fermes,* at Caen, to obtain a practical knowledge of the subject, and at the age of 23 was appointed to the lucrative office of *Fermier-Général;* but the oppressive nature of the duties which it involved was not at all to the liking of Helvetius, who was of a very humane and easy disposition, and he quickly resigned it for the situation of chamberlain to the queen's household. He now led, like every other courtier of his time, a life of mere gallantry, which looks odious enough at this distance of time; but happily he soon grew tired of it, and after marrying in 1751 the beautiful and accomplished daughter of comte de Ligneville, he withdrew to a small estate at Voré, where he spent the most of his life in the education of his family, the improvement of his peasantry, and literary labors. In 1758 appeared his celebrated work, *De l' Esprit,* in which he endeavors to prove feeling (*sensibilité*) to be the source

of all intellectual activity, and that the grand lever of all human conduct is self-satisfaction. But he admits, at the same time, that self-satisfaction assumes different forms; e.g., the self-satisfaction of a good man consists in the subordination of private to more general interests—first to the circle among which he lives; then to the community; and, finally, to the world at large. The philosophy of the book is, of course, materialistic. It was denounced by the doctors of the Sorbonne, and condemned by the parliament of Paris to be publicly burned. Helvetius was much disgusted, and in 1764 left France to visit England and Germany, where Frederick II. received him with distinction. He died at Paris, Dec. 26, 1771, leaving behind him a work, *De l' Homme, de ses Facultés, et de son Education*, which was published by prince Galyzin (2 vols. London, 1773). Among the editions of his collected works, two deserve special notice, both published at Paris in 1795, the one in 5 and the other in 13 volumes. His wife, who survived him many years, resided at Auteuil, near Paris, where she was visited by the most distinguished personages, and is often mentioned in the memoirs of that brilliant period.

HEMADYNAMOM'ETER (derived from the Greek words *hæma*, blood, *dynamis*, force, and *metron*, a measure) is the name of an instrument devised about 30 years ago by Poisseville for determining the pressure of the blood in the arteries and veins of the living body. The pressure of the blood is measured, as in the barometer, by the column of mercury that it balances. The instrument has been recently improved in various ways, and a contrivance has been added by which the oscillations of the mercury are inscribed in the form of an undulating curve on a cylinder made to revolve by clock-work; the height of the undulations denoting the *pressure*, and their horizontal amplitude the *time*.

HEMANS, Felicia Dorothea, an English poetess, was b. at Liverpool, Sept. 25, 1794. At an early age she manifested a taste for poetry, in which she was encouraged by her mother. Her first volume was published in 1808, when she was only 14 years of age, and contained a few pieces written about four years earlier; her second, entitled *The Domestic Affections*, appeared in 1812. In the same year she married capt. Hemans of the 4th regiment, whose health had suffered in the retreat on Corunna, and afterwards in the Walcheren expedition, and who found it necessary a few years after to remove to Italy. After that period they never met. Although five sons were born of this marriage, it was not understood to have been happy. Mrs. Hemans spent the rest of her life in North Wales, Lancashire, and latterly at Dublin, where she died April 26, 1835. Her principal works are: *The Vespers of Palermo*, a tragedy (1823); *The Siege of Valencia; The Last Constantine, and other Poems* (1828); *The Forest Sanctuary* (1827); *The Songs of the Affections* (1830); and *Hymns for Childhood; National Lyrics and Songs for Music*, and *Scenes and Hymns of Life*. A volume of *Poetical Remains* was published after her death, and subsequently a complete edition of her works, with a memoir by her sister, was issued by Messrs. Blackwood.

Mrs. Hemans, without great daring or force, is sweet, natural, and pleasing. But she was too fluent, and wrote much and hastily; her lyrics are her best productions; her more ambitious poems, especially her tragedies, being, in fact, quite insipid. Still, she was a woman of true genius, and one or two of her little pieces, *The Graves of a Household; The Treasures of the Deep; The Homes of England*, and some others, are perfect in pathos and sentiment, and will live as long as the English language.

HEMASTAT'ICS and **HEMADYNAM'ICS**, the statics (q.v.) and dynamics (q.v.) of the blood Gr. *haima*). See Blood, Circulation of the Blood.

HEMATEM'ESIS (Gr. *haima*, blood, and *emesis*, vomiting), a rejection of blood from the stomach, usually in consequence of some morbid change in its mucous membrane. See Stomach, Diseases of. Hematemesis is apt to be mistaken for hemoptysis (q.v.), unless careful attention is given to the mode in which the blood is ejected. The proper remedies are the liberal use of ice or ice-cold water; acetate of lead, in doses of two to five grains; tannin, five to ten grains (it must not, however, be given with acetate of lead); oil of turpentine, six to ten drops, repeated every hour or two. The first and the last are perhaps the most effectual means, which can be used in combination. The turpentine may be given whipped up with the white of an egg. It must be discontinued when the symptoms of urinary irritation begin to appear.

HEM'ATINE, or **HEMATO'SINE**, is the term applied by chemists to the red coloring matter of the blood of the higher animals. In the normal state, it occurs in solution in the interior of the blood corpuscles or cells; but in certain morbid conditions, in which the blood undergoes a species of decomposition, it is deposited in a solid form in the tissues surrounding the smaller vessels through whose walls it has percolated. It can only be isolated in a coagulated form, in which state it has been submitted to analysis by Mulder, who assigns to it the formula $C_{44}H_{22}N_2O_6Fe$. Its chief peculiarity is, that it contains a comparatively large percentage of iron (very nearly 7 per cent). It is the only constituent of the body (if we except the hair) which does contain this metal.

HEMATINE (*ante*), the coloring matter which, when combined with a certain proteid body (probably the globuline of the older physiologists, since called by Preyer globine), forms hemoglobine (q.v.). All the iron belonging to the hemoglobin is a constituent of the hematine; still it is held by modern physiologists that the body hemo-

globin is the real coloring matter of the blood, the hematine not being able to perform the functions of a colorizer and oxygen carrier alone. It must share that power with the proteid body. See HEMOGLOBINE.

HEMATITE (Gr. *haima*, blood), a mineral consisting chiefly of peroxide of iron, often occurs in large quantity, and is a valuable iron ore. See IRON. There are two principal varieties, *red hematite* and *brown hematite*. The former frequently occurs in globular and grape-like masses, with a radiating fibrous structure. It is sometimes of a dull reddish-brown, sometimes of a brilliant bluish-gray color; the streak is blood-red. An earthy kind is called *iron froth*, and consists almost entirely of peroxide of iron. Brown hematite contains about 14 per cent. of water. Its color is generally some shade of brown, sometimes almost black. Different shades of color are often presented in concentric wavy bands. The surface is often covered with a beautiful black varnish, which is sometimes iridescent. It is not unfrequently found crystallized in rhombohedric, prismatic, or tabular crystals. The primary form is a right rhombic prism. Both red hematite and brown hematite are found in Britain, but the former more abundantly.

HEMATOCELE (Gr. *haima*, blood, and *kēlē*, tumor), a tumor containing blood; opposed to hydrocele (q.v.).

HEMATOZO'A (Gr. *hæma*, blood, and *zoön*, a living creature) is the term applied by helminthologists to the entozoa existing in the blood. They occur in mammals, birds, reptiles, fishes, and many invertebrate animals. Some of them belong to the nematoidea, others to the trematoidea, and others to the protozoa. Most of them are microscopic, devoid of generative organs, and exist in the blood, circulating both in the arteries and in the veins. A very small number attain a considerable size, and are provided with organs of reproduction. These larger ones are generally found in some definite part of the circulating system. Thus, for example, in man the *distoma hæmatobium* is almost entirely restricted to the abdominal venous system; in the horse, the *sclerostoma aneurysmaticum* to the abdominal arterial system; and in the porpoise, the *pseudalius filum* to the pulmonary artery and its branches.

Nothing definite is known regarding the origin of these parasites, but certain observations made upon the hematozoa of the frog by Valentin (and subsequently confirmed by Vulpian), lead to the belief, that some of the more minute forms are the larvæ of a worm living in the organs surrounding the vessels. We shall restrict our remarks to the hematozoa occurring in man, the horse, and the dog. By far the most important of human hematozoa is the *distoma hæmatobium* already mentioned. It has only been observed in Egypt, where it is very common, and where it was found by Griesinger 117 times in 363 autopsies. The male, which is the larger of the two, is about three-tenths of an inch in length. The common liver fluke (*D. hepaticum*) has, in one instance at least, been found in the interior of the portal vein. In the various cases in which distomata have occurred in tumors, they must have been conveyed to the places in which they were found by the blood.

In the year 1665 Ruysch discovered a large number of small worms in a dilatation of the mesenteric artery of a horse. Sixty years afterwards, a second case was noticed, and it is now known that such cases are of extreme frequency. These verminous aneurisms of the abdominal arteries occur in the ass and in the mule, as well as in the horse. The worm found in them is the *sclerostoma armatum*, one of the nematoidea, and often more than an inch in length. It is old horses that are chiefly affected; indeed they scarcely ever seem to escape, for Rayer found these tumors 48 times in the examination of 50 worn-out horses. For much very interesting information on this curious subject, the reader is referred to Rayer's memoir in the *Archiv. de Médecine comparée* for 1842.

In the dog, hematozoa sufficiently large to be visible to the naked eye are rare. Thirteen such cases are collected by Davaine in his *Traité des Entozoaires*, 1860, the worm generally being a filaria. The microscopic larvæ of a nematoid worm are sometimes found in enormous quantities circulating in the blood of this animal. From the examination of the blood of 480 dogs, Gruby and Delafond believe that 1 in every 20 of these animals presents this peculiarity.

In none of the above cases does the presence of these entozoa appear to affect the general health of the individual in whom they reside, whether he be man, horse, or dog.—For further information on this subject, the reader may be referred to Davaine, *op. cit.* pp. 308–342, and Vogel's *Pathological Anatomy*, p. 442, etc.

HEMATU'RIA (Gr. *haima*, blood, and *ouron*, urine), the discharge of blood with the urine, usually from disease of the kidneys or bladder. It is rather a symptom than a disease, and takes its character from the associated morbid conditions of the parts concerned. It is a symptom always of some gravity, but not very often directly fatal. Perhaps the best general remedy is the tincture of the muriate of iron, given in water in doses of twenty drops.

HEMEROBAPTISTS, an ancient Jewish sect who made daily ablution an essential part of religion. Epiphanius, who mentions their doctrine as the fourth heresy among the Jews, classes the Hemerobaptists doctrinally with the Pharisees, from whom they

differed only in that, like the Sadducees, they denied the resurrection of the dead. The name has been sometimes given to the Mendæans on account of their frequent ablutions; and in the *Clementine Homilies* St. John the Baptist is spoken of a Hemerobaptist. Mention of the sect is made by Hegesippus and by Justin Martyr in the *Dialogue with Tryphon.*

HEMEROCAL'LIS. See DAY-LILY.

HEMIBRANCHIATES, a group of bony fishes belonging to the order of TELEOSTS, which by some naturalists has been erected into an order, while the teleosts have been raised to the rank of a sub-class. The classification adopted in this work treats the teleosts (q.v.) as the third order in which are found the sticklebacks and pipe fishes (q.v.). The hemibranchiates, as the name implies, have imperfect gills or branchiæ connected with peculiarities of the skeleton.

HEMICRA'NIA (Gr. *hemi*, one half, and *kranion*, the skull; Fr. *migraine;* Eng. *megrims*), a variety of headache (q.v.), distinguished by its affecting only one side at a time, and also frequently by its intermittent character; whence it has been termed, not very accurately, brow-ague.

HEMIDES'MUS, a genus of plants of the natural order *asclepiadaceæ*. The root of *Hemidesmus Indicus* is used in medicine, chiefly in India, and is known as Indian sarsaparilla. It is in some cases a good substitute for sarsaparilla, and appears to derive its properties from a crystallizable and volatile principle called *hemidesmin* or *hemidesmic* acid. The plant is a climbing shrub, with leathery leaves and axillary umbels of flowers. It is common in almost all parts of India.

HEMIGALE, a mammal of the family *viverridæ*, having a body resembling that of the weasel. Its fur is a grayish brown, with six or seven dark wide stripes across the back. It has a pointed head and nose, short ears, long tail, and strong thighs. It is about the size of the ichneumon, and feeds on eggs and small animals including birds. It is a native of the East Indies.

HEMIO'PIA (Gr. *hemi*, one-half, and *ops*, the eye), vision limited to one-half of an object—a peculiar and rare form of disease, very imperfectly understoood.

HEMIPLE'GIA (Gr. *hemi*, one-half, and *plēssō*, I strike), paralysis (q.v.) limited to one side of the face and body, and usually depending upon disease of the brain. Opposed in signification to paraplegia (q.v.).

HEM'IPODE, *Hemipodius*, a genus of gallinaceous birds, nearly allied to quails, but distinguished by a more slender beak, and by the want of a hind-toe. They are the smallest of gallinaceous birds, and inhabit cultivated grounds and sterile sandy plains in warm countries. One species, the ANDALUSIAN HEMIPODE (*H. tachydromus*), is found in Spain, Italy, Sicily, Africa, and Australia. Its whole length is about 6 inches.

HEMIP'TERA (Gr. half-winged), an order of insects, with four wings, a mouth formed for sucking, undergoing imperfect metamorphoses, and having the first pair of wings either of a firm membranous substance without scales, or leathery at their base, and membranous at their tips. Those with the first pair of wings of the former character are the order *homoptera* (q.v.) of many entomologists; the latter are the *hemiptera* proper, the section or sub-order *heteroptera* of Cuvier and others. The wings of the hemiptera proper in general partly overlap each other, and are horizontal or slightly inclined when at rest. Some kinds are wingless, which, however, otherwise exhibit the characters of this order. Some of the hemiptera feed on vegetable, and some on animal juices. The principal changes which they undergo in their metamorphoses are increase of size and development of wings. They are active in all stages. Some of them are aquatic. They are most abundant in tropical countries, and some of the tropical kinds are very splendid. Examples of this order are bugs, water-bugs, boat-flies, and water scorpions.

HEMISPHERE, the half of a sphere, when it is bisected by a plane passing through its center.

HEMLOCK, *Conium*, a genus of plants of the natural order *umbelliferæ*, having compound umbels of small white flowers, small general and partial involucres, the limb of the calyx merely rudimentary, and a compressed ovate fruit with five prominent wavy ridges and no *vittæ*. The best known and only important species is the COMMON HEMLOCK (*C. maculatum*), which grows by waysides, on heaps of rubbish, and in other similar situations in Britain and on the continent of Europe, in some parts of Asia, and now also as a naturalized plant in North America and in Chili. It has a root somewhat resembling a small parsnip; a round, branched, hollow, bright-green stem, 2 to 7 ft. high, generally spotted with dark purple; the leaves large, tripinnate, of a dark shining green color; the leaflets lanceolate, pinnatifid. All parts of the plant are perfectly destitute of hairs, and it is the only British species of the order *umbelliferæ* which has the stem smooth and spotted with purple. Both the general and partial umbels have many rays. The general involucres consist of several small leaflets; the partial involucres of three small leaflets, all on one side. The whole plant has a nauseous smell, particularly if rubbed or bruised. The leaves are the only part of the plant employed in medicine. They should be gathered just before the time or at the commencement of

flowering, and after the removal of the larger stalks they should be quickly dried by a heat not exceeding 120°. They should then be preserved in perfectly closed tin canisters. As, however, the dried leaves sometimes yield no *conia, conylia,* or *coniine* (a volatile alkaloid, which is the active principle in the plant), the fresh leaves are much more certain in their action.

The most important ingredient in hemlock is the *conia,* which is more abundant in the fruit (seeds) than in the leaves. From 40 lbs. of the ripe but green seeds, Dr. Christison obtained two ounces and a half of hydrated conia. As it is volatile, it is obtained by distilling the seeds with water which contains a little potash in solution; conia then passes over with the water in the form of a yellowish oil, and when purified by redistillation, it is obtained as a colorless, transparent, oily liquid, having a specific gravity of 0.8, a penetrating, hemlock-like odor, communicating a burning sensation when applied to the tongue, and acting as a very energetic poison. It exhibits a powerful alkaline reaction, and precipitates many metallic oxides from their salts. Strong sulphuric acid causes its compounds to assume first a purple-red and then an olive-green color; while nitric acid gives a blood-red color, fading into an orange. Its composition is represented by the formula $C_{16}H_{15}N$. Wertheim has recently discovered a second alkaloid in hemlock, which contains the elements of two equivalents more of water than conia. This substance, whose formula is $C_{16}H_{17}NO_2$, he names *conidrin.* It may be sublimed in beautiful colorless needles, and is much less poisonous than conia.

Conia has been introduced into the *pharmacopœia Norvegica* under the name of *coniinum,* the dose being from one-fortieth to the one-sixtieth part of a grain. The following illustrations will give an idea of its activity as a poison: One drop placed in the eye of a rabbit killed it in nine minutes; three drops employed in the same way killed a strong cat in a minute and a half; while five drops poured into the throat of a small dog began to act in thirty seconds, and in as many more, motion and respiration had ceased. It seems to exhaust the energy of the spinal cord, and thus to cause muscular paralysis.

The uses of hemlock in medicine may be arranged under two distinct heads: 1. Those which depend upon its resolvent and alterative powers; and, 2. Those which have reference to its influence over the nervous system. 1. It has been found useful in mammary tumors and profuse secretion of milk, in bronchocele, in enlargements of the liver, spleen, and pancreas, in scrofulous affections, etc., and at one time had a high reputation in cases of cancer. 2. It is useful as an antispasmodic and anodyne in whooping-cough, spasmodic cough generally, asthma, neuralgia, etc.

In large or poisonous doses it sometimes gives rise to coma (such as opium does), and sometimes to convulsions or violent delirium. Kercher relates the following singular instance of delirium from its use: Two priests ate hemlock-root by mistake; they became raving mad, and fancying that they were geese, plunged into the water. For three years they were afflicted with partial palsy and violent pain.

It may be administered internally in the form of powder (of the leaves), tincture, or extract, while externally it may be applied as a soothing application to ulcers, painful piles, etc., in the form of ointment or poultice. The conia being volatile, often escapes from the powdered leaves and from the extract, and of the three preparations named, the tincture is the best. The *succus conii,* or *preserved juice of hemlock,* prepared by Bentley and other pharmaceutical chemists, is more certain in its action than any of the pharmacopœial preparations.

In cases of poisoning by hemlock, the evacuation of the stomach is the first thing to be attended to. Among the ancient Greeks poisoning by hemlock was a common mode of death for condemned criminals, and thus it was that Socrates died; but whether it was the juice of the common hemlock or the water hemlock that was used, is unknown. —WATER HEMLOCK, or COWBANE (*cicūta virosa*), is also an umbelliferous plant, of a genus having much vaulted umbels, a 5-toothed calyx, and almost globose fruit, each carpel with five broad flattened ribs and evident single *vittæ.* Water hemlock grows in ditches, the margins of ponds, and wet grounds in Europe and the n. of Asia. It is more common in Scotland than in England. It has a large fleshy white root, covered externally with fibers; an erect much branched stem, 2 to 5 ft. high; tripinnate leaves, with linear-lanceolate regularly and sharply serrated leaflets, no general involucre or only a single small leaflet, partial involucres of many short narrow leaflets, and white flowers. It is a virulent narcotic acrid poison. Serious accidents have occurred from eating the root. Another species, *C. maculata,* is common in North America, growing in marshy places. It has a spotted stem, like that of true hemlock, the name of which it very generally receives in North America. The leaves are tri-ternate, the leaflets ternate. It is a very poisonous plant, and is the cause of many deaths.—*Cicuta,* in Latin, seems to have been the name of the same plant called *conēion* by the Greeks, but it is not known whether this or the previous plant was so denominated.

HEMLOCK SPRUCE. See FIR.

HEMODORA'CEÆ, a natural order of endogenous plants, consisting of herbaceous plants with fibrous roots, and sword-shaped leaves; differing from *iridaceæ* in habit, and in having the stamens six in number, or if only three, opposite to the petals. There are about 50 known species, chiefly natives of North and South America, south Africa,

the Mascarene islands, and New Holland. Some of them have beautiful flowers. A red color exists in the roots of some; hence the name BLOOD-ROOT has been given to them. In this order are ranked the *vellozias* or tree lilies.

HEMOGLOBINE, the principal constituent of the red blood-corpuscles. It is the coloring matter of these bodies and consequently the coloring matter of the blood. It was formerly supposed that *hematine*, a substance which is intimately combined with a proteid body to form hemoglobine, was the coloring matter of the blood; but although iron plays an important part in respiration and in the changes of the color of the blood which take place in the various functions of nutrition, and although the iron is specially a constituent of the hematine factor of hemoglobine, it does not perform the functions connected with oxidation and with dioxidation except when in combination with that proteid body; in other words, except as it forms a part of the body called hemoglobine. The exact nature of the proteid constituent has not been precisely determined, but has been regarded as the globuline(q.v.) of the older physiologists; whence the name hemoglobine, contracted from hematoglobuline. Hematine is therefore regarded as a derivative of hemoglobine, and not as a true proximate principle. Hemoglobine obtained from the rat, guinea-pig, squirrel, hedgehog, horse, dog, cat, and goose, crystallizes readily, in slender four-sided rhombic prisms. Those from the blood of the guinea-pig are rhombic octahedrons. Those of the squirrel are six-sided plates. Hemoglobine obtained from the blood of the ox, sheep, rabbit, pig, and man, crystallizes with difficulty. The causes of these differences are not known, but may depend upon the slight difference in the proportion of water of crystallization which has been found to exist. The crystals, when examined with the microscope, are of a bright scarlet, like that of arterial blood when viewed with the naked eye, but when the crystals are in mass they have a darker, more purplish appearance; but a solution in water has the same tint as arterial blood. Examined with the spectroscope, a dilute solution is observed to absorb certain rays of light in a peculiar way, a portion of the red end of the spectrum being absorbed, and a larger portion of the blue end; but the most characteristic phenomenon is the appearance of two strongly marked absorption bands between the letters D and E on Fraunhoffer's scale, the narrow band being the most intense, and in extremely dilute solution the only one visible. By increasing the strength of the solution the bands are intensified and broadened, and the absorption spaces at each end of the spectrum also increase, and by further increasing the strength of the solution the bands may be brought together, so as to form one broad band, when the only rays of light which pass through the spectrum will be in the green and red portions, on either side of the combined bands. By still increasing the strength of the solution the green light becomes absorbed, leaving only the red rays to pass through, these being the last to disappear, which accounts for the natural red color of the solution when seen by transmitted light. Carefully prepared crystals of hemoglobine when placed in the vacuum of an air-pump part with a certain quantity of oxygen and change color. The quantity of oxygen given off is definite, 1 gramme of crystals parting with 1.76 cubic centimeters of oxygen. This oxygen is held in a rather loose state of combination, not forming a part of the permanent hemoglobine crystal, as in the following analysis by Hoppe-Seyler of the crystals taken from the blood of the dog: carbon 53.85; hydrogen 7.32; nitrogen 16.17; oxygen 21.84; sulphur 0.39; iron 0.43, with 3 or 4 per cent of water of crystallization. An ordinary solution of hemoglobine contains also a definite quantity of oxygen in a loose state (added to the quantity given in the above analysis), and which under the air-pump is yielded up, the color passing from scarlet to purple (oxyhemoglobine passing to reduced hemoglobine). This excess oxygen may also be discharged by passing hydrogen gas, which causes dissociation between the permanent hemoglobine and the loosely held oxygen. It may be also expelled by the use of reducing agents, such as ammonium sulphide, or an alkaline solution of sulphate of iron. When a reduced solution of hemoglobine is examined by the spectroscope the spectrum is changed from that of the unreduced solution which contains the excess of oxygen. The two absorption bands are absent, their place being occupied by a single, broader, though fainter band, and there is also less absorption at the blue end of the spectrum. Even in strong solutions much bluish light passes through, which explains the bluish color of reduced hemoglobine. When reduced hemoglobine, either in solution or in crystals, is exposed to the air it immediately absorbs oxygen, and if sufficient is present it returns to the state of oxyhemoglobine, each gramme absorbing 1.76 cubic centimeters of the gas. If this proportion of oxygen is not present the reduced hemoglobine takes up all there is, regaining the scarlet of oxyhemoglobine in proportion to the amount of oxygen absorbed. If oxyhemoglobine has been deoxidized by a reducing agent, and this latter is in excess, curious phenomena of alternate change of color will be observed on letting the tube stand for a time and then shaking it with air. When it has become purple, the act of shaking will be immediately followed by a change of color to scarlet. On standing a short time the solution will resume its purple color, again to be changed to scarlet on shaking. This experiment explains the change of color which takes place in the blood while performing its physiological functions in the system and in the lungs, parting and combining with oxygen alternately. The venous blood which is thrown from the right ventricle into the lungs has lost much of its excess of oxygen; its oxyhemoglobine is reduced to

permanent hemoglobine, and it has a dark purplish color. It is only in asphyxiated blood, however, that the excess oxygen is wholly discharged, when the opaque blood looks almost black. In the lungs, where the blood meets with the inspired air, the carbonic acid gas which had been held in solution is given off, and the reduced hemoglobine receives again a quantity of excess oxygen and becomes scarlet in color. The oxygenated blood returns to the heart, whence it is thrown into the arteries, and thence into the capillaries, where an interchange takes place between their contents and the outlying tissue fluids which results in the reduction of the oxyhemoglobine to permanent hemoglobine, and of course a return to the purple color of venous blood. See RESPIRATION and NUTRITION.

HEMOP'TYSIS (Gr. *ptysis*, spitting), expectoration of blood, a very significant and often dangerous symptom of disease of the lungs or heart, in all cases of great importance, and requiring immediate attention, but apt to be viewed popularly with a somewhat exaggerated alarm. It is seldom directly fatal. It is rather as an indication of dangerous disease, than from its immediate danger, that it requires such careful attention; but unquestionably, it is a matter of common prudence to seek medical advice on the appearance of even the slightest tinge of blood in the expectoration from the lungs. The gravity of this symptom depends very much on its cause. The treatment can scarcely be undertaken without a medical examination; but in case of extremity, it may be desirable to know that repeated doses of ipecacuanha (q.v.), carried even up to the emetic effect, have often been found serviceable.

HEMORRHAGE (Gr. a bursting forth of blood), a flux of blood from ruptured arteries, veins, or capillaries. See BLEEDING.

HEMORRHOIDS (Gr. flowing of blood). See PILES, for which disease hemorrhoids is a technical synonym.

HEMP, *Can'nabis*, a genus of plants of the natural order *cannabinaceæ* (q.v.), having the male and female flowers on different plants; the male flowers with 5-partite calyx and 5 stamens; the female flowers with a spathe-like calyx of one leaf, rolled round the ovary and partially split along one side, and two threadlike stigmas. There is only one known species (*C. sativa*), varying considerably, however, from soil, climate, and cultivation. It is an annual plant, a native of the warmer parts of Asia, but has been cultivated in Europe from the earliest historic times, and is now naturalized in many parts of Europe and America. Like flax, it wonderfully adapts itself to diversities of climate, and is cultivated equally under the burning sun of the tropics, and in the northern parts of Russia. It is, however, readily injured by frost, particularly when young; and in many countries where it is cultivated, it succeeds only because their summer is sufficient for its whole life. Hemp varies very much in height, according to the soil and climate, being sometimes only 3 or 4 feet, and sometimes 15 or 20 ft., or even more. Notwithstanding the nettle-like coarseness of its leaves, it is an elegant plant, and is sometimes sown on this account in shrubberies and large flower-borders. The stem is erect, more or less branched; the leaves are 5—9-fingered. The flowers are yellowish green, small, and numerous; the male flowers in axillary racemes on the upper parts of the plant; the female flowers in short axillary, and rather crowded spikes. The female plants are higher and stronger than the male, for which reason the female plants are popularly known in Germany as *mastelhopfen*, and the male as *femelhopfen*, the names been derived from the Latin *mas* and *femella*, and perpetuating an error which probably is as old as the time of the Romans. The stem of hemp is hollow, or only filled with a soft pith. This pith is surrounded by a tender brittle substance, consisting chiefly of cellular tissue, with some woody fiber, which is called the *reed, boon,* or *shove* of hemp. Over this is the thin bark, composed chiefly of fibers extending in a parallel direction along the stalk, with an outer membrane or cuticle. Hemp is cultivated for its fiber in almost all countries in Europe, and in many other temperate parts of the world; most extensively in Poland, and in the center and south of European Russia, which are the chief hemp exporting countries. French hemp is much esteemed in the market, as is also that of England and Ireland, of which, however, the quantity is comparatively inconsiderable. *Bolognese hemp* and *Rhenish hemp* are varieties remarkable for their height; and a fiber of very fine quality, 8 or 9 ft. long, is known in commerce by the name of *Italian garden hemp*. In Britain the cultivation of hemp is almost confined to Lincolnshire, Holderness, and a few other districts of England, of which the moist alluvial soil is particularly suited to it. In cultivating hemp it is very necessary to have the soil so rich, and to sow the seed at such a season, that the plants shall grow rapidly at first, as they thus form long fibers. A crop of short scrubby hemp is almost worthless. The finer kinds of hemp are used for making cloth; the coarser, for sail-cloth and ropes. Hemp sown thin produces a coarser fiber than hemp sown thick. Something also depends on the time of pulling, for the crop is pulled by the hand. When a rather fine fiber is wanted, and the seed is not regarded, the whole crop is pulled at once, soon after flowering; otherwise, it is usual to pull the male plants as soon as they have shed their pollen, and to leave the female plants to ripen their seed, in which case the fiber of the female plants is much coarser. The treatment of hemp, by *retting*, etc., is similar to that of flax (q.v.) The fiber of hemp is generally used for

coarser purposes than that of flax, particularly for sail-cloth, pack-sheet, ropes, and the caulking of ships.

The seed of hemp is produced in great abundance. It is commonly sold as food for cage-birds; and birds are so fond of it, that not only the ripening fields, but the newly sown fields, must be carefully guarded against their depredations. A fixed oil, *oil of hempseed*, is obtained from it by expression, which is at first greenish yellow and afterwards yellow, and has an acrid odor, but a mild taste. This oil is used in Russia for burning in lamps, although the wick is apt to get clogged; also for making paints, varnish, and a kind of soft soap.

Hemp is cultivated in warm countries, not so much for its fiber as for a resinous secretion, which has narcotic or intoxicating qualities. See HASHISH.

Hemp is also used as a therapeutic agent under the name of INDIAN HEMP, or BHANG. In this country it is administered in the form of resinous extract or of tincture; and it is usually prescribed (like opium) for its hypnotic, anodyne, and antispasmodic properties. Although less certain in its action than opium, it possesses these advantages over that drug—that it does not constipate the bowels, create nausea, or check the secretions, and that it is less likely to occasion headache.

The name hemp (Ger. *hanf*) is probably derived, along with the Greek and Latin *cannabis*, from an oriental name, of which one form is the Arabic *kinnub*. The name hemp is often extended with some distinctive prefix to many of the fibers used for ropes and coarse fabrics, a practice which produces not a little confusion. Thus the fiber of *Apocynum cannabium* (see APOCYNACEÆ) is called CANADIAN HEMP, as well as the plant itself; bowstring hemp (q.v.) is the fiber of the species of *sanseviera;* sunn (q.v.) is often called SUNN HEMP; it is also known as BENGAL HEMP, BOMBAY HEMP, MADRAS HEMP, and BROWN HEMP; JUBBULPORE HEMP is the produce of another species of *crotalaria* (q.v.); the fiber of *hibiscus cannabinus* (see HIBISCUS) is called BROWN HEMP and DECKANEE HEMP at Bombay; Manila hemp or abaca (q.v.) is the fiber of a *musa*.

HEMPEL, CHARLES JULIUS, b. Prussia, 1811; studied medicine in Paris, and in 1835 emigrated to New York, where he graduated at the New York university. In 1857 he was made prof. of materia medica in the homœopathic college of Pennsylvania. He has written a number of important manuals and other works on homœpathic practice.

HEMP PALM (*Chamærops excelsa;* see CHAMÆROPS), a palm of China and Japan, the fiber of the leaves of which is much employed in these countries for making cordage. Hats are also made of its leaves, and even cloaks and other garments for wet weather.

HEMS, HOMS, or **HUMS** (Lat. *Emesa*), a city of Syria, is situated about a m. e. of the right bank of the Orontes, in lat. about 34° 44′ n., long. 36° 43′ east. It is 65 m. n.e. of Baalbek and 110 m. w.n.w. of Tadmor (Palmyra). It is clean, compactly built, and surrounded by old walls; and although there are now no ancient buildings remaining, the antiquity of the city is attested by numerous fragments of columns, by several Greek inscriptions, and the foundations of ancient baths with specimens of mosaic pavement. In ancient times it was chiefly celebrated for its splendid temple of the Sun, one of the priests of which, Elagabalus or Heliogabalus, was raised to the imperial throne of Rome. Under the walls of Hems, Zenobia was defeated by the emperor Aurelian in 272 A.D. In 636 the city was taken by the Saracens, when its old Semitic name Hems was revived; and in 1099 the Crusaders rode through its opened gates. Since then Hems has experienced many vicissitudes of fortune, all of which, however, it has survived, and is now the seat of a flourishing trade, and of several manufactures. Pop. between 20,000 and 30,000.

HEMPSTEAD, a co. in s.w. Arkansas, on Little Missouri, Red, and Little rivers, intersected by the Cairo and Fulton railroads; 700 sq.m. Pop. '70, 13,768. The surface is hilly, soil fertile, producing cotton, corn, etc. Co. seat, Washington.

HEMPSTEAD, a township and village in Queens co., N. Y.; pop. '70, of the township, 13,999; of the village, 2,316. The township originally extended n. and s. across Long Island, from the sound to the ocean, but was afterwards divided about midway, and the name Hempstead now belongs to the southern half. It contains the villages of Pearsalls, Rockville Center, Baldwins, Freeport, Garden City, Hempstead, and several smaller villages. There are few manufactures, the population being mainly engaged in farming and market-gardening. The main line and southern central branches of the Long Island railroad pass through the town. The county agricultural fair grounds are in the n. part of the town at Mineola, on the main line of the railroad. The fairs held there have a high reputation for the exhibition of horses, cattle, and poultry, comparing to advantage with the state fairs. On the ocean the island of Long Beach, belonging to the town, has been leased for a long term of years, and is occupied by one of the largest summer hotels near New York. The main hotel building is 900 ft. long, and there are large pavilions and bathing houses, and special railroad trains secure rapid access from New York and Brooklyn. Hempstead village is regularly laid out, with flagged sidewalks, and is lighted with gas. The dwellings are generally of wood, but well-built, and some very elegant. There are 5 churches, the Presbyterian church claiming to be the oldest Presbyterian society in the United States, organized in 1644. The Epis-

copal church has in its possession a charter of incorporation signed by king George II., and some communion plate given by queen Anne. There are two public halls, four engine-houses, with an excellent volunteer fire department, three principal hotels, a steam flour mill, molding mill, and about 20 places of mercantile business.

HEMSTERHUIS, TIBERIUS, a celebrated Dutch philologist, was b. at Groningen, Jan. 9, 1685. He became professor of Greek and of history at Leyden in 1740, where he died April 7, 1766. One of the greatest Greek scholars of his time, Hemsterhuis may be said to have created a new school of Greek philology, to which belong his distinguished pupils Ruhnken and Valkenaer. His editions of the *Onomasticon* of Pollux (1706), of the *Select Dialogues* of Lucian (1708 and 1732), and of the *Plutus* of Aristophanes (1744, by Schäfer, 1811), are his principal literary works. A beautiful picture of his life is given in Ruhnken's *Elogium Hemsterhusii* (Leyd. 1768 and 1789), republished in Lindemann's *Vitæ duumvirorum T. Hemsterhusii et D. Ruhnkenii* (Leip. 1822). From Hemsterhuis's MSS., *Anecdota Hemsterhusiana* (1825) have been edited by Geel, and *Orationes et Epistolæ* (1839) by Friedemann.

HEMSTERHUYS, or HEMSTERHUIS, FRANÇOIS, 1720-90; a Dutch writer on moral philosophy and æsthetics, studied at the university of Leyden, and for many years acted as secretary to the state council of the united provinces. He continued, however, the study of philosophy partly by social intercourse with a few similarly disposed friends, and partly by correspondence with philosophical writers of other countries, mainly with Jacobi. His writings, though not of high speculative worth, are distinguished by elegance of form and by a touch of refined sentiment. His most direct contributions to philosophy are in the department of æsthetics.

HEN. See FOWL, *ante.*

HENAULT, CHARLES JEAN FRANÇOIS, 1685-1770; a French historian, educated at the Jesuit college des Quatre-Nations. Captivated by the eloquence of Massillon, he entered the oratory with the view of becoming a preacher, but after two years' residence he changed his intention, and, inheriting a position which secured him access to the most select society of Paris, he at an early period achieved distinction by his gay, witty, and graceful manners, and by various light poetical pieces, and two discourses which respectively gained a prize at the French academy in 1707, and at the academie des Jeux Floraux in 1708. In 1706 he became councilor of the parliament of Paris, and in 1710 was chosen president of the court of *enquêtes.* He was admitted into the French academy in 1723, and subsequently into the leading literary societies of Europe. After the death of Bernard de Coubert he became superintendent of the household of queen Marie Leczinska, whose intimate friendship he had previously enjoyed. On his recovery in his fiftieth year from a dangerous malady, he professed to have undergone religious conversion and retired into private life, devoting the remainder of his days to study and devotion. His devotion, however, did not prevent his continuing a near friendship with Voltaire. His chief literary work was the *Abrégé Chronologique,* first published in 1744 without the author's name. It is valuable both for popular use and as a work of reference. In the compass of two volumes he has comprised the whole history of France from the earliest times to the death of Louis XIV. His information is for the most part drawn from original sources, and for such a work the number of errors is remarkably small. Besides some other historical works of minor importance, Henault wrote several dramatic pieces of no particular merit. His *Mémoires* published in 1854, are fragmentary and disconnected, but contain many interesting anecdotes and details regarding persons of note.

HENBANE, *Hyoscyamus,* a genus of plants of the natural order *solanaceæ,* having a five-toothed calyx, an irregular funnel-shaped corolla, and a capsule opening by a lid, and inclosed in the hardened calyx. The species are mostly annual and biennial herbaceous plants, and natives of the countries near the Mediterranean sea. The only species found in Britain is the COMMON HENBANE (*H. niger*), which is not uncommon in waste places, and in the neighborhood of towns and villages, particularly in calcareous soils, and on the sandy shores of Scotland. It is an annual or biennial plant, somewhat bushy, about two feet high; with large sinuated or sharply-lobed leaves without leaf-stalks, and large dingy yellow flowers, with brownish-red or purple veins. The whole plant is covered with unctuous hairs, and has a nauseous smell, which gives warning of its strong narcotic poisonous quality. Cases of poisoning by henbane are, however, not rare; but are more frequently owing to the proceedings of quacks, than to any mistake of the plant for an esculent.

The seeds contain in largest quantity the peculiar alkaloid on which the properties of the plant chiefly depend, *hyoscyamia* or *hyoscyamine,* which crystallizes in stellated acicular crystals of a silky luster. The symptoms of poisoning by henbane are similar to those produced by other narcotic poisons, and the proper treatment is the same as in cases of poisoning by opium. In medicine, henbane is employed both externally and internally. The leaves are the part commonly used; they are gathered and quickly dried when the plant is in full flower. Fomentations of henbane are applied to painful glandular swellings, parts affected with neuralgia, etc., and are often found to afford relief. An extract of henbane is sometimes employed instead of belladona to dilate the

pupil of the eye. Tincture and extract of henbane are often administered in cases of annoying cough, spasmodic asthma, and other diseases requiring sedatives and antispasmodics. Henbane is also employed to calm mental irritation, and to induce sleep. For many cases, it has one great advantage over laudanum, in not producing constipation. The smoke from the burning seeds of henbane is sometimes introduced into a carious tooth, to relieve toothache.

The other species of henbane possess similar properties. The dried stalks of *H. albus* are used by smoking in Greece to allay toothache.

HENDERSON, a co. in Illinois on the Mississippi, intersected by Henderson river, and the Chicago, Burlington, and Quincy railroad; 366 sq.m.; pop. '70, 12,582. The surface is hilly and to a large extent covered with forests, soil fertile; chief productions: corn, wheat, and pork. Co. seat, Oquawka.

HENDERSON, a co. in w. Kentucky on the Ohio and Green rivers, crossed by the St. Louis and Southwestern railroad; 550 sq.m.; pop. '70, 18,457—5,990 colored. It has a hilly surface and is to a large extent covered with forests. The soil is fertile, producing tobacco, corn, pork, etc. Co. seat, Henderson.

HENDERSON, a co. in w. North Carolina, w. and n. of the Blue Ridge and e. of French Broad river; 350 sq.m.; pop. '70, 7,706—1,208 colored. The surface is rough, and in large part forest land. The valleys are fertile, producing chiefly corn. Co. seat, Hendersonville.

HENDERSON, a co. in w. Tennessee drained by affluents of Tennessee river; 600 sq.m.; pop. '70, 14,217—2,408 colored. It is level, with large forests of oak, chestnut, etc. The soil is fertile, producing cotton, corn, etc. Co. seat, Lexington.

HENDERSON, a co. in n.e. Texas on Trinity and Natchez rivers; 934 sq.m.; pop. '70, 6,786—1654 colored. It has an undulating surface and fertile soil; chief productions: cotton, corn, and pork. Co. seat, Athens.

HENDERSON, a city in Henderson co., Ky., on the St. Louis and Southwestern railroad and the Ohio river; pop. 4,171. It has a court-house, 10 churches, schools, foundries, car-works, grist mills, saw mills, a woolen factory, and a planing mill.

HENDERSON, ALEXANDER (1583–1646), was a Scotch ecclesiastic, who became professor of rhetoric and philosophy at St. Andrews in 1610. He was presented to the living of Leuchars by archbishop Gladstanes, where as his religious principles were antagonistic to those of his parishioners he was for a long time unpopular, but as he later in life changed his views he became one of the most influential ministers of Scotland. He took an active part against Episcopal innovations, and was mainly responsible for the "National Convention" which was publicly signed in Greyfriars church, Edinburgh, 1638. During the troubled times of king Charles I.'s reign, Henderson's influence was greatly felt, in the negotiations for peace between the Scottish ecclesiastics and the court, and he had a personal interview with the king, when he accompanied the commissioners to London, and when Charles visited Scotland in state (1641) Henderson attended him as chaplain, and later on went to Oxford to mediate between the king and his parliament. In 1643 Henderson was elected moderator for the third time in the Edinburgh assembly, and in that capacity presented a draft of the famous "Solemn League and Covenant." He, with Baillie, Rutherford, and others, was sent to London to represent Scotland in the Westminster assembly, when the "Solemn League" with slight modifications passed both houses and became law for the two kingdoms. When in 1646 the king joined the Scottish army and retired with it to Newcastle, he sent for Henderson, and discussed the systems of church government in a number of papers. But Henderson's health was failing; he set off on his return to Scotland, and eight days after his arrival died at Edinburgh, and his death was the occasion of a national mourning in Scotland. Henderson is one of the greatest men in Scottish history, and next to Knox the most renowned ecclesiastic of Scotland. His political genius was great, and he was, as prof. Mason observed, "a cabinet minister without office." He has left a deep mark in the history both of England and Scotland, and the Presbyterian church of to-day owes much to his influence. He is justly looked upon as the second founder of the Scottish Reformed Church.

HENDERSON, EBENEZER, 1784–1858; a Scotch dissenting minister, and a prolific miscellaneous writer. He accompanied the rev. John Paterson to India (1805), and as the East India company would not allow British vessels to convey missionaries to India, Henderson and his colleague were forced to go to Denmark and await the chance of a passage to Serampore. Being delayed, they decided to remain where they were, and Henderson was fixed at Elsinore, and devoted himself to the distribution of Bibles in the Scandinavian countries. In the course of his labors he visited Sweden and Lapland, Iceland, Denmark, and Germany. A greater part of the time he acted as agent for the British and Foreign Bible society. In 1818 he accompanied Dr. Paterson through Russia as far as Tiflis, and in 1822 was asked by prince Galetzen to assist in translating the Scriptures into the various languages spoken in the Russian empire. Returning to England after 20 years foreign labor, Henderson was appointed tutor of the Mission college, Gosport. He succeeded Dr. Harrison, 1830, as professor of oriental languages in Highbury Congregational college, which position he retained until 1850, when he

was forced to resign on account of his infirmities. His last work was a translation of the book of Ezekiel. His linguistic attainments were very great; he made himself acquainted not only with the ordinary languages of scholarship, but also with Hebrew, Syraic, Ethiopian, Russian, Arabic, Tartar, Persic, Turkish, Armenian, Manchoo, Mongolian, and Coptic. The first Bible society in Denmark was organized by him, 1814; he was associated both with the London religious tract society and the society for the propagation of the Gospel among the Jews. He published an account of his travels in Iceland, and amongst many other works was the author of *Biblical Research and Travel in Russia, Divine Inspiration*, and the annotations of many of the Scriptures.

HENDERSON, JAMES PINCKNEY, 1808–58; b. N. C., but passed his life chiefly in Texas and Mississippi. He was a general in the army of Texas during the revolution of 1836; afterwards secretary of state; minister to England, and in same capacity to the United States to secure annexation. He was the first governor after the annexation. He served in the Mexican war, and was presented with a sword by congress. In 1857 he was chosen senator from Texas.

HENDRICKEN, THOMAS FRANCIS, D.D., b. Ireland, 1827; graduated at a college in Kilkenny, and was ordained a Roman Catholic priest in Dublin. He was one of the American mission in 1853, and served in several parishes in Rhode Island and Connecticut. In 1872 he was made bishop of Providence.

HENDRICKS, a co. in w. central Indiana, drained by tributaries of Eel river, and intersected by three railroads; 400 sq.m.; pop. '70, 20,277. It is mostly level, with large forests, and the soil is fertile; chief productions: corn, wheat, pork, and cattle. Co. seat, Danville.

HENDRICKS, THOMAS ANDREWS, b. Ohio, 1819; graduated at South Hanover college, and was admitted to the Pennsylvania bar in 1843. He pursued his profession in Indiana. He became a member of the legislature and of the state constitutional convention; was twice chosen to congress; was commissioner of the general land office, and in 1863 became a U. S. senator. In 1868 he was before the democratic national convention as a candidate for president, but the nomination was given to Horatio Seymour. In 1876 he was candidate for vice-president on the democratic ticket, but was not elected.

HENGSTENBERG, ERNST WILHELM, a celebrated modern German theologian, was b. Oct. 20, 1802, at Fröndenberg, in Westphalia, where his father was clergyman. Prepared by his father for the university, he devoted himself at Bonn chiefly to oriental and philosophical studies, whilst at the same time he took an enthusiastic part in the *Burschenschaften*. Though sympathizing thus in his early years with liberal and rationalistic movements in Germany, soon after going to Basel, in 1823, he came under the influence of the missionary institution there, and, before he had begun the professional study of theology, was drawn into the theological tendency which he afterwards represented. Going to Berlin, in 1824, as theological *privat-docent*, he put himself at the head of a rising orthodox party, and, with most conscientious devotedness, made the scientific defense of their principles the aim of his labors in the university, and through the press. Though known as a theological author only by two little treatises—*Ueber d. Verhältniss d. innern Wortes zum äussern* (1825), and *Ueber Mysticismus, Pietismus und Separatismus* (1826)—he was made, in 1826, extraordinary, in 1828 ordinary, professor; and in 1829, doctor of theology. Through the press, his influence was exerted chiefly as editor of the *Evangelische Kirchenzeitung*, which was begun in 1827, and still combats rationalism even in its mildest forms, seeking to restore the orthodoxy and church discipline of the 16th and 17th centuries. With the same view were written all his principal works; his *Christologie d. A. T.* (3 Bde. 1829–35; 2te Aufl. 1854–57); *Beiträge zur Einleitung ins A. T.* (3 Bde. 1831–39); *Commentar über d. Psalmen* (4 Bde. 1842–45; 2te. Aufl. 1850); *Die Geschichte Bileams u. Seiner Weissagung* (1842); *Das Hohelied Salomonis ausgelegt* (1853); and others are devoted to the defense of the old interpretation and criticism of the Scriptures against the results of modern biblical science in Germany. Hengstenberg's influence in ecclesiastical matters also, which was very great during the reign of the late king of Prussia, was employed in the carrying out of the high Lutheran dogmas of the church, of church-offices, and of the sacraments, by persecution of sectaries, by opposition to the union of Lutherans and Reformed, and by attempts to depose from their chairs Gesenius, Wegscheider, De Wette, and other rationalistic teachers in the universities. His latest works were *Evangelium des heil. Johannes* (1869); *Geschichte des Reiches Gottes unter dem Alten Bunde; Das Buch Hiob erläutert* (1870). A number of his works have been translated. Hengstenberg died May 28, 1869.

HENGST AND HORSA. See ANGLO-SAXONS.

HEN'NA, or HINNA, a name originally Arabic, and sometimes found with the Arabic article incorporated in the form *alhenna* or *alkanna*, belongs equally to *Lawsonia inermis* and *L. spinosa*, shrubs of the natural order *lythraceæ*. They differ in little, but that the one is unarmed and the other thorny, the latter being also the larger plant. Many botanists unite them into one species, under the name *L. alba*. Henna grows in moist situations throughout the north of Africa, Arabia, Persia, and the East Indies. It is cultivated in many places for the sake of its flowers, which are much prized for their fra-

grance, particularly by the Egyptian ladies; but still more for the sake of the leaves, which abound in coloring matter, and which, being dried, powdered, and made into a paste with hot water and catechu, are very generally employed by women throughout the east to stain the nails and tips of the fingers of an orange color; also by men to dye their beards, the orange color being converted into a deep black by indigo; and for dyeing the manes and hoofs of horses, and to dye skins and leather reddish-yellow. Powdered henna leaves form a large article of export from Egypt to Persia, and to various parts of Turkey, from which they find their way to more northern countries, and even to Germany, to be employed in dyeing furs and some kinds of leather. The use of henna for staining the nails appears—from allusions in ancient poets, and from some of the Egyptian mummies—to have prevailed from very ancient times.

HENLE, Friedrich Gustav Jakob, b. Bavaria, 1809, a physician and physiologist; in 1852 professor of anatomy and director of the anatomical institute at Göttingen; noted for the use of the microscope in anatomical research. He has published several works on anatomy and pathology.

HENLEY, John, 1692–1759; an English clergyman known as "Orator Henley," noted for his eccentricities; while at college in Cambridge, Feb., 1712, he under the pseudonym of Peter de Quir addressed a letter to the *Spectator* displaying no small wit and humor. After graduating he became assistant and then head-master of the grammar school of his native town, uniting with these duties those of assistant curate, besides publishing in 1714 a poem entitled *Esther, Queen of Persia*. He also compiled a grammar of ten languages entitled *The Complete Linguist*. Removing to London, he was appointed assistant preacher in Ormond street and Bloomsbury chapels, and in 1723 was presented to the rectory of Chelmondiston in Suffolk; but residence being insisted upon, he resigned both his appointments, and July 3, 1726, opened what he called an "oratory" in Newport market, which he licensed under the toleration act. He introduced many peculiar alterations into his service, and drew up a "primitive liturgy," in which he substituted for the Nicene and Athanasian creeds two creeds taken from the apostolic constitutions; for the Eucharist he made use of unleavened bread and mixed wine; he distributed at the price of one shilling medals of admission to his oratory. He is described by Pope in the *Dunciad* as "preacher at once and zany of his age." Besides his sermons on Sunday he delivered lectures on Wednesday chiefly on social and political subjects; and he also projected a scheme for connecting with the "oratory" a university intended to be the foster-mother of the arts and sciences. For some time he edited the *Hyp Doctor*, a weekly paper established in opposition to the *Craftsman*, and for this service he enjoyed a pension of £100 a year from sir Robert Walpole. At first his orations drew great crowds, but his audience latterly dwindled almost entirely away.

HENLEY-ON-THAMES, a t. of Oxfordshire, England, on the left bank of the Thames, 35 m. w. from London. The Thames is here crossed by a handsome bridge. Henley-on-Thames is on the branch of the Great Western railway. There are several charities, and a reading-room and valuable library, open to all ratepayers, bequeathed by Dean Aldrich of Henley, who died in 1757. Malting is a principal branch of industry; there are also breweries; and there is a considerable trade in corn, flour, and timber. Pop. '71, 4,523.

HEN'NEGAU. See Hainaut, or Hainault.

HENNEPIN, a co. in e. Minnesota, on the Mississippi and Minnesota rivers, crossed by the St. Paul and Pacific, and the Minneapolis and St. Louis railroads; 600 sq.m.; pop. '75, 48,725. The surface is undulating, and dotted with small lakes. The soil is fertile; chief productions: wheat, corn, oats, and butter. Co. seat, Minneapolis.

HENNEPIN, Louis, 1640–1701; b. Belgium; a Roman Catholic (Franciscan) missionary among the American Indians. He preached for some years in Holland, and in 1675 was sent to Canada with La Salle, and bishop Laval. The next year he was in the Indian mission of fort Frontenac, and visited the Mohawk country. Two years later he accompanied La Salle's expedition to Niagara and the upper lakes, and constructed a vessel in which they proceeded by the Erie, Huron, and Michigan lakes, to St. Joseph's river, which they navigated in canoes. Reaching the Illinois, they built fort Crèvecoeur. Here La Salle left them in search of supplies, and Hennepin and his party proceeded down the Mississippi till in April, 1680, they were captured by Sioux Indians and taken to the native villages. During this journey Hennepin discovered the falls of St. Anthony, and one of his party penetrated as far as lake Superior and made a treaty of peace. Not long afterwards Hennepin returned to Quebec and sailed for France where he published his *Description de la Louisiane*, and *Nouvelle decouverte au Sud-ouest de la Nouvelle-France*, containing an account of La Salle's expedition and of the missionary's own discoveries. Hennepin refused to return to America, though ordered to do so by his superiors of the church, and took refuge in Holland. After La Salle's death Hennepin published his *Nouvelle decouverte d'un très grand pays situé dan l'Amerique*. In this he claimed to have been the first man to descend to the mouth of the Mississippi; a statement which was long ago shown incorrect. His works won great popularity and were printed in several languages.

HENOTICUM, an edict of the emperor Zeno, published A.D. 482, and intended to unite the Eutychians with the Catholics. It was procured from the emperor by Acacius, patriarch of Constantinople; and was in the form of a letter, addressed by Zeno to the clergy and the people of Egypt and Libya. As it contained a favorable mention of the council of Chalcedon, it was supposed to favor the Eutychian party; and after much opposition, was at length formally condemned by pope Felix II.

HENRICIANS, or HENRICANS, a sect founded by Henry of Lausanne in the 12th century. Grieved at the corruption of the times, he abandoned the order to which he belonged, and became an earnest preacher of righteousness. His consistent life and the eloquence of his discourses deeply moved the people. At first, Hildebert the bishop favored him, but afterwards drove him from Mans. Joining the disciples of Peter of Bruys in Provençe, he was arrested by the archbishop of Arles, and at the second council of Pisa, 1134, was declared a heretic, and placed in a cell. Subsequently released, he again went to the south of France, where he had great influence over the lower classes. He was arrested by pope Eugenius III., and at the council of Rheims condemned to perpetual imprisonment, but died in prison, 1149.

HENRICO, a co. in e. Virginia between Chickahominy and James rivers, intersected by the Chesapeake and Ohio railroad; 250 sq.m.; pop. '70, 66,179—31,031 colored. The surface is hilly and the scenery picturesque. The chief productions are corn, wheat, and oats. Bituminous coal is found. Co. seat, Richmond (the state capital).

HENRIETTA, ANNA, 1644–70; daughter of Charles I. of England and queen Henrietta Maria; reared by her mother in a convent in France. Louis XIV. was her cousin, but she found no favor in his eyes until her brother Charles II. became reigning king of England. She then (1661) married the only brother of the French king, Philip, duke of Orleans. She was a great favorite at the French court, but her husband treated her with aversion. She died suddenly after intense suffering, and the general belief prevailed that she was poisoned. Bossuet's funeral discourse in her honor is a masterpiece of oratory.

HENRIETTA MARIA, 1609–66; queen consort of England, wife of Charles I. She was a daughter of Henry IV. of France. When the first overtures for her hand were made on behalf of Charles, then prince of Wales, 1624, she was but just 14 years of age. Her brother, Louis XIII., only consented to the marriage on the condition that the English Roman Catholics were relieved from the operation of the penal laws. When, therefore, she set out for her new home in June, 1625, she had already pledged the husband to whom she had been married by proxy on May 1, to a course of action which was certain to bring unpopularity upon him as well as upon herself. That husband was now king of England. The early years of the married life of Charles I. were most unhappy. He soon found an excuse for breaking his promise to relieve the Roman Catholics. His young wife was deeply offended, and the favorite Buckingham did all in his power to promote disunion between the king and queen. After the assassination of Buckingham in 1628, the barrier between them was broken down, and the affection which from that moment united them never lessened. For some years Henrietta Maria's chief interests lay in her young family, and in the amusements of a gay and brilliant court. She loved dramatic entertainments, and her participation in the private rehearsals of the *Shepherd's Pastoral*, written by her favorite Walter Montague, probably subjected her to the savage attack of Prynne. With political matters she scarcely interfered. Even her co-religionists obtained little aid from her until 1637. She then appointed an agent to reside at Rome, and a papal agent, a Scotchman named Con, accredited to her, was soon engaged in effecting conversions amongst English gentry and nobility, but Protestant England took alarm. When the Scottish troubles broke out, she raised money from her fellow Catholics to support the king's army on the borders in 1639. During the session of the short parliament in 1640, the queen urged the king to oppose himself to the house of commons in defense of the Catholics. When the long parliament met, the Catholics were assumed to be the authors of every arbitrary scheme in the plans of Strafford or Laud. Before it had sat for two months, the queen was urging upon the pope the duty of lending money to enable her to restore her husband's authority. She threw herself heart and soul into the schemes for rescuing Strafford and coercing the parliament. The army plot, the scheme for using Scotland against England, and the attempt upon the five members were results of her political activity. In the following year she crossed over to the continent, and in Feb., 1643, she landed at Burlington quay, placed herself at the head of a force of loyalists, and marched through England to join the king near Oxford. After a little more than a year's residence there, April 3, 1644, she left her husband to see his face no more. At Exeter she gave birth to her youngest child who was one day to be duchess of Orleans, and to negotiate the treaty of Dover. Henrietta Maria found a refuge in France. Richelieu was dead, and Anne of Austria was compassionate. As long as her husband was alive the queen never ceased to encourage him to resistance. During her exile in France she had much to suffer. She brought up her youngest child Henrietta in her own faith, but her efforts to induce her youngest son, the duke of Gloucester, to take the same course only produced discomfort in the exiled family. The story of her marriage with her attached servant lord Jermyn, needs more confirmation than it has yet received to be accepted, but all

information which has reached us of her relations with her children point to the estrangement which had grown up between them. When after the restoration she returned to England, she found she had no place in the new court. She received from parliament a grant of £30,000 a year in compensation for the loss of her dower lands, and the king added a similar sum as a pension from himself. In Jan., 1661, she returned to France to be present at the marriage of her daughter Henrietta to the duke of Orleans. In July, 1662, she set out again for England, and took up her residence once more at Somerset house. Her health failed her, and on June 24, 1665, she departed in search of the clearer air of her native country. She died Aug. 31.

HENRIQUEL-DUPONT, Louis Pierre, b. Paris 1797. He entered the studio of M. Pierre Guérin, and after remaining there three years, turned his attention to engraving. His first production, the "Portrait of a Young Woman with her Infant," gained the second medal at the exhibition of 1822. He produced in succession a "Portrait of M. de Pastoret," "Strafford," "The Interment of Christ," after Paul Delaroche; "The Abdication of Gustavus Vasa," after Hersent; "The Disciples at Emmaus," after Paul Veronese, etc.; and is considered the most eminent French engraver of the day. In 1853 and 1855 he received the grand medal of honor, was decorated Aug. 14, 1831, and succeeded Richomme at the *académie des Beaux-Arts* in 1849. He was elected an honorary member of the Royal academy of London in 1869.

HENRY, a co. in Alabama, between Georgia on the e. and Florida on the s.; 930 sq.m.; pop. '70, 14,191. On the e. flows the Chattahooche. The county is fertile, but abounds in immense pine forests. Co. seat, Abbeville.

HENRY, a co. in n.w. Georgia, bounded n.e. by South river; 450 sq.m.; pop. '70, 14,193—6,236 colored. It has a hilly surface, and much forest land. Chief productions: cotton, corn, and wheat. Co. seat, McDonough.

HENRY, a co. in n.w. Illinois, on Rock river, and its affluents intersected by the Chicago, Rock island and Pacific, and two other railroads; 830 sq.m.; pop. '70, 35,413. The surface is mostly prairie, and the soil is fertile. Corn, wheat, oats, cattle, and pork are the main products. Co. seat, Cambridge.

HENRY, a co. in e. Indiana, on Big Blue river and the Pittsburg, St. Louis, and Cincinnati, and the Fort Wayne, Muncie, and Cincinnati railroads; 400 sq.m.; pop. '70, 24,986. The surface is undulating, and much of it is covered with forests. The soil is fertile, producing corn, wheat, oats, and pork. Co. seat, Newcastle.

HENRY, a co. in s.e. Iowa, on Skunk river, traversed by the Burlington and Missouri river railroad; 432 sq.m.; pop. '75, 21,594. It has a prairie and woodland surface, and the soil is fertile. Chief productions: corn, wheat, oats, hay, and pork. Co. seat, Mount Pleasant.

HENRY, a co. in n. Kentucky, s.w. of Kentucky river which is here navigable, and traversed by the Louisville, Cincinnati and Lexington railroad; 220 sq.m.; pop. '70, 11,066—2,438 colored. It has an undulating surface with abundant forests. The soil is fertile; chief productions: tobacco, corn, wheat, and pork. Co. seat, Newcastle.

HENRY, a co. in w. Missouri on Grand river, crossed by the Missouri, Kansas and Texas railroad; 750 sq.m.; pop. '70, 17,401—642 colored. The surface is chiefly prairie, with forests of oak, hickory, etc. Chief productions, corn, wheat, oats, and bituminous coal. Co. seat, Clinton.

HENRY, a co. in n.w. Ohio, on Maumee river, crossed by a division of the Baltimore and Ohio, and the Wabash railroads; 420 sq.m.; pop. '70, 14,028. It has a level surface, and much of it is covered with forests. Corn, oats, and hay are the main products. Co. seat, Napoleon.

HENRY, a co. in w. Tennessee, on the Kentucky border, bounded e. by Tennessee river; 600 sq.m.; pop. '70, 20,380—5,204 colored. The surface is level, and the soil fertile; chief productions: tobacco, cotton, and corn. Co. seat, Paris.

HENRY, a co. in s. Virginia on the North Carolina border, intersected by Smith river; 450 sq.m.; pop. '70, 12,303—5,581 colored. It has a rough surface with large forests. Productions: tobacco, corn, and oats. Co. seat, Martinsville.

HENRY, a post village in Marshall co., Ill., on the Illinois river and a branch of the Chicago, Rock island and Pacific railroad; 33 m. n.n.e. of Peoria; pop. 2,162. It has 8 churches, a bank, a newspaper, and some manufactories. Marshall college, founded in 1855, is the principal institution.

HENRY I., king of England, the youngest son of William the conqueror, was b. in 1068. When his brother, William II., was found dead in the new forest, where they had both been hunting, on Aug. 2, 1100, with a broken arrow in his breast, prince Henry at once seized the reins of government, which, according to the then but imperfectly understood law of primogeniture, should have passed into the hands of his elder brother, Robert, duke of Normandy, who was at the time in Italy, on his way home from crusading in Palestine. Henry was crowned at Westminster, the third day after his brother's violent death. Regarding it he instituted no inquiry, possibly because he was privy to it; and he successfully held the crown against his brother Robert, at first

negotiating with him, and granting him a pension to resign his pretensions, but finally making war upon his badly-governed duchy. Robert was defeated in a bloody battle before the walls of Tenchebray, on Sept. 28, 1106, taken prisoner, and shut up in Cardiff castle during the remaining 28 years of his life. The acquisition of Normandy, the ancient patrimony of his family, had been a point of ambition with Henry, as he despised England and the English; but he had some trouble in keeping it, as the French king, Louis VI., and the counts of Anjou and Flanders, took part with William, Robert's youthful son, whose virtues and misfortunes secured him friends. Henry, however, brought over to himself the count of Anjou, by betrothing his only son to the count's daughter; he rendered neutral, by his eloquence and fair promises, pope Calixtus II., whose intervention in the interests of justice had been besought; and he defeated the French king and his mailed knights in the almost bloodless battle of Brenneville, in 1119. Next year his successes in arms and intrigue were darkened for life by the death of his only son William, who was drowned at sea on his passage from Normandy to England, unregretted by the English, who knew of his hatred towards them, his arrogance, and his gross vices. Henry himself died from a surfeit of lampreys, on Dec. 1, 1135, as he was preparing to leave Normandy, to repress an incursion of the Welsh. He was very anxious that his daughter Matilda, who had married Geoffrey Plantagenet, the boy count of Anjou, on the death of her first husband, Henry V., emperor of Germany, should succeed him on the throne, and had twice made the English nobles swear fealty to her; but on his death the crown was seized by Stephen of Blois, the son of Adela, the conqueror's youngest daughter.

Henry I. was styled Beauclerc, or the scholar, in honor of his learning, which, for a king in his age, was not undeserving of distinction. He had great natural ability, especially in the line of state intrigue. Law was administered with considerable fairness, and not a little rigor, during his reign, and his administrative ability restrained the spirit of rebellion which had been seething incessantly since the conquest. The punishment of crimes during his reign was capricious and barbarous; death, the loss of eyesight (which he is alleged to have inflicted on more than one of his relatives), and perpetual imprisonment, being the most usual penalties of the law.

HENRY II. of England was the grandson of Henry I. by his daughter Matilda, and her second husband Geoffrey Plantagenet, and was b. in 1133. His mother, assisted by her illegitimate brother, the earl of Gloucester, in the early part of Stephen's reign, and towards its close by Henry himself, had made war against Stephen, as a usurper, who had no good title to the throne. In 1153, when the rival armies were drawing near each other, a treaty for a compromise was set on foot, and in the course of it the only son of Stephen having died, it was agreed that Stephen should reign during his life, and that Henry should succeed him, which he did on Stephen's death next year. He was crowned Dec. 19, 1154, along with his queen Eleanor, whom, at the age of 18, he had married within six weeks after she was divorced by Louis VII. of France. She was countess of Poitou, and duchess of Aquitaine, in her own right. Henry inherited from his father Anjou, Touraine, and Maine, and his father and mother succeeded by force of arms, in keeping and taking possession of Normandy for themselves and him; so that, by one method and another, he came to be possessed of a large portion of France as well as England. His chief rivals in power were the clergy, who could use their weapon of excommunication with terrible effect, and who being tried by their own courts were not amenable to the common laws of the realm, and were protected from the punishment due to their crimes, which were too often of the deepest dye. To aid him in reducing the church to subjection to the civil power, he appointed his trusted chancellor, Thomas à-Becket, to the see of Canterbury, and compelled him and the other ecclesiastics to agree to the "constitutions of Clarendon;" a set of laws enacted by a sort of prototype of a parliament, or council of the barons, and having for their object to render the crown and the civil law (such as it had grown to be) superior to the church. Becket, however, proved to be a true churchman, and the long and obstinate struggle between him and his monarch was only terminated by his murder. See BECKET, THOMAS À. Henry did penance at his grave, allowing himself to be scourged by monks; but though the "constitutions of Clarendon" were formally repealed, the king was ultimately successful in reducing the church to subordination in civil matters. During his reign, occurred the conquest of Ireland. That country was then the home of a number of tribes or clans of the ordinary feudal type, and pope Adrian IV., in 1156, by a bull, gave Henry authority over the entire island, and ordered the inhabitants to obey him. He had not leisure at the time to conquer them, but afterwards, English aid being solicited by one of the Irish petty kings, Dermot of Leinster, Henry gave leave to any of his subjects to aid him; and Robert Fitzstephens, constable of Albertivi, Maurice Fitzgerald, and Richard de Clare, surnamed Strong-bow, earl of Strigul, went over with a very few hundred trained Englishmen, and in one year conquered Ireland. They succeeded so well, that Henry became jealous, and recalled them; and next year (1172) he went over himself, to conquer in a royal way, and was everywhere loyally received, except in Ulster. This was the nominal conquest of Ireland, but the majority of the Irish tribes and chieftains continued to be independent barbarians for centuries.

During this reign, also, the first considerable ascendency of England over Scotland

was gained. Henry's sons, incited by their jealous mother, queen Eleanor, rebelled against him, and their cause was espoused by the kings of France and Scotland. The latter, William the lion, was ravaging the n. of England with an army, when he was surprised at Alnwick, and taken prisoner, July 12, 1174. To obtain his liberty, he stipulated to do homage to Henry for Scotland, to cede for ever to him the fortresses of Roxburgh and Berwick, and the castle of Edinburgh for a limited time. In the course of this filial rebellion, Henry, the eldest son, died of a fever, exhibiting great remorse, and Geoffrey was killed in a tournament at Paris. Richard, surnamed Cœur de Lion, with king Philip of France, obtained some advantages over his father. A treaty of peace was concluded between them, of which one of the stipulations was for an indemnity for all the followers of Richard. The sight of the name of his favorite son John in the list, acting upon a constitution weakened by many cares, threw the king into a fever, of which he died, July 6, 1189.

Upon the whole, Henry was an able and enlightened sovereign. The barons were indeed overawed, but the monarch did not use his power despotically. Law made very great progress in his reign; circuit courts were established, and other improvements effected. The earliest writer on English law, Ranulph de Glanville, was Henry's chief justiciary. In intellect and character, he resembled his grandfather, Henry I., but his violations of the moral law were fewer, and less heinous. Still he had some illegitimate children, his mistress, the fair Rosamond, being the mother of two that are remembered: William Longsword, earl of Salisbury, and Geoffrey, who became archbishop of York, and who was faithful to him when his four legitimate sons took up arms against him.

HENRY III. of England, grandson of Henry II., and eldest son of king John, was b. Oct. 1, 1206, and succeeded to the throne on his father's death at the age of ten. He inherited his father's weakness, and he managed everything ill both at home and abroad. A war with France cost him Poitou, and might have been more disastrous, but for the virtuous disposition of the French king, Louis IX., commonly called St. Louis. In his boyhood, under the direction of the judicious earl of Pembroke, he ratified the magna charta; and he did so in manhood, to appease the discontent of his parliament, and obtain allowances of money. But he kept no vows. He was beset with favorites chiefly from the country of his queen, Eleanor of Provence, and he allowed exorbitant exactions on the part of the clergy and the pope. His misrule roused the people and the barons in parliament, headed by his brother-in-law, Simon de Montfort, earl of Leicester, who forced him to transfer his power temporarily to a commission of barons. He agreed to this by the provisions of Oxford in 1258. The barons were somewhat tardy in reforming the state, and the king desired to regain a power which he alleged, with truth, had been taken from him by compulsion, though wearing the appearance of free-will. The question of the validity of these provisions was submitted by both parties to St. Louis of France, whose conscientiousness was such that foreigners could trust him. He annulled the provisions. Leicester and his party disregarded their agreement to be bound by his judgment, and took up arms against the king. They defeated him, and took him prisoner in the battle of Lewes, on May 14, 1264. The battle was followed by an agreement called the mise of Lewes, more humiliating to the king than the provisions of Oxford. Leicester, being virtually king, summoned a sort of parliament; and to extend his popularity, which was already great, he intimated that boroughs should be represented, and this kind of representation was realized in embryo for the first time in English history. But his supremacy did not last long. Within a year, the powerful earl of Gloucester deserted his party, and enabled prince Edward, the talented son of the king, who had been taken prisoner at Lewes, to escape from captivity. They led an overwhelming army against Leicester, who was defeated and slain at Evesham, on Aug. 4, 1265. The king died on Nov. 16, 1272, and was succeeded by his son Edward. The weakness of Henry and his father had allowed the development of the power of the barons, and the counterpoise of these two forces, regal and aristocratic, was approached in these reigns by a method which has developed into the British parliament. Statute law dates from the time of Henry III.; the "provisions of Merton," passed in the twentieth year of Henry's reign, being the first enactment on the English statute-book.

HENRY IV., of the house of Lancaster, on the deposition of his cousin Richard II. by the parliament, usurped the crown in 1399, in the beginning of which year he had succeeded his father, John of Gaunt, in the duchy of Lancaster. He was surnamed Bolingbroke, from the place (in Lincolnshire) where he was born, in 1366, and had no valid title to the crown, or the pretense of it, except that he was the son of the fourth son of Edward III. The peace of his reign was disturbed by the Welsh, under Owen Glendower (q.v.), and by the Scotch, who were defeated, however, at Nesbit Moor on June 22, and at Homildon hill on Sept. 14, 1402. Henry Percy (surnamed Hotspur), the conqueror in the latter engagement, and his family shortly after broke with the king, and leagued with the Scotch earl Douglas and Glendower against him; but this coalition was destroyed by the battle of Shrewsbury on July 21, 1403. Other two insurrections followed, which were easily suppressed. The king grew to be afflicted with leprosy and epilepsy, and died of a fit in Westminster abbey on Mar. 20, 1413, in the

forty-seventh year of his age, having found a usurped crown to be a heavy burden even for a strong head.

HENRY V., who succeeded his father Henry IV., was b. at Monmouth (whence his surname), in 1388. In his youth he had acquired great military distinction in operations against Glendower, and after his military work was put an end to, through his father's jealousy and distrust of him, he became almost equally celebrated for dissipation. But when he became king (April 21, 1413), he shook himself in great measure free of bad habits and companions, and in an endeavor at the outset of his reign to be both just and generous, he liberated from the confinement in which his father had placed him the young earl of March, who was the true heir to the crown, and restored the son of Hotspur to the lands and honors which his father had lost by rebellion. He paid a tribute to religion also, or rather to the orthodoxy of the age, by persecuting the Lollards by fire and halter. The great effort of his reign was an attempted conquest of France, in which he virtually succeeded. He had no right to the French crown; but in these days of usurpation and unsettled laws of succession, when might and right were practically identical, he seems to have believed sincerely that he had a right. In his first campaign to vindicate it, he besieged and took the town of Harfleur, and gained the battle of Agincourt (q.v.), Oct. 25, 1415, against such enormous odds as to make his victory one of the most notable in history. Two years after, he again invaded France, and made Normandy once more subject to the English crown. An incapable king and civil discord aided him greatly. On May 20, 1420, there was ratified at Troyes "perpetual peace" between Henry and the French. Henry demanded and had conceded to him the regency of France, the eldest daughter of the king and queen to be his queen, and the succession to the French crown on the death of the king. He had hardly returned to England, and been married to this French princess, Catherine, when the defeat at Baugé, in Mar., 1421, of his brother the duke of Clarence, whom he had left governor of Normandy, by a force consisting largely of Scotch, and commanded by the Scotch earl of Buchan, who killed the duke with his own hand, rekindled the hopes of the French, who supported the contention of Charles the dauphin against the treaty of Troyes, to which he had not agreed. Henry returned to France for a third campaign, and his wonted success in arms was following him, when he was seized with illness, and died in a month on Aug. 31, 1422, in the thirty-fourth year of his age, leaving an infant to succeed him, and a splendid reputation for all those qualities that constitute a magnanimous monarch.

HENRY VI., the only child of Henry V. and Catherine of France, was b. at Windsor, Dec. 6, 1421. As he was not quite nine months old when his father died, his uncle John, duke of Bedford, was appointed to govern France, and another uncle, Humphrey, duke of Gloucester, to be "protector of the realm and church of England," with a council appointed by parliament to aid and control him, the parliament declining to appoint him regent, though the late king had desired it. The incapable Charles VI. of France having died, his son the dauphin assumed the title of Charles VII., and went on fighting with the English. His army, commanded by the Scotch earl of Buchan, who had been appointed constable of France for his victory over the duke of Clarence in the previous reign, and consisting of 14,000, half Scotch and half French, was almost annihilated by the English under Bedford, at Verneuil, Aug. 27, 1424. The Scotch auxiliaries ought not to have been there, as peace had been made with the Scots a year before, and their young king, James I., had been set at liberty, after a useful captivity of twenty years, and had returned to his kingdom with lady Jane Beaufort, a daughter of the duke of Somerset, and relation of the royal family, as his queen.

The victory of Verneuil was the last great success obtained by the English in France, and their power, which only force could support or justify, gradually crumbled down. In 1428 they laid siege to Orleans, but the siege was raised next year by the French, inspired by Joan of Arc (q.v.); and although she was burned as a witch by the English in 1431, their power continued to decline. Normandy was completely lost by the fall of Cherbourg in 1450; and ultimately, in 1453, they were expelled from all France (Calais excepted), greatly to the true advantage of both that country and England.

Disputes between Gloucester, the regent, and his uncle, the powerful bishop of Winchester, as well as war with France, prevailed during the minority of the king. As he grew up, he manifested no tendency to either vicious or intellectual activity. He inherited, in fact, the imbecility of his grandfather, Charles VI. of France. In 1445 the weak king found a wife in the strong-minded Margaret of Anjou; and in 1447 the Winchester party, supported by her, succeeded in having Gloucester thrown into prison for high treason, where he was soon found dead in his bed, without external mark of violence, but most likely murdered, as Edward II. had been, by thrusting a red-hot iron through his bowels. Winchester did not long survive his nephew and rival; and in 1450 the duke of Suffolk, the queen's favorite minister, being impeached by the Commons, was condemned to be banished from the kingdom, but was shortly after taken, and executed on board one of the king's ships. The want of strength in the king, as well as in his title to the crown, was an invitation to every form of faction to display itself. Jack Cade, an Irish adventurer, who pretended to be a Mortimer, obtained a temporary possession of London; but the citizens overcame him and his pillaging fol-

lowers, and he was taken and beheaded in a garden by the sheriff of Kent. The true representative of the Mortimers was Richard, duke of York, and he was one of the unquiet spirits of the reign. As a descendant of Lionel, duke of Clarence, the third son of Edward III., his title to the crown was superior to that of the king, who was descended from the duke of Lancaster, the fourth son of that monarch, and he laid claim to the crown with more or less openness, according to circumstances. His influence and address was so great that in 1454, on the occasion of the king's weak mind being entirely eclipsed, he was appointed protector by parliament. On the king's recovery, he was indisposed to give up his power, and levied an army to maintain it. On May 22, 1455, the battle of St. Albans was fought, and the Yorkists were victors; 5,000 of the supporters of the house of Lancaster being killed, the duke of Somerset, the queen's favorite minister for the time, being among them; and the king himself being taken prisoner. This was the first battle of twelve that was fought between the houses of York and Lancaster, in the wars commonly called the wars of the roses, from the emblem of York being a white rose, and of Lancaster a red rose. (For a brief account of the struggle, see EDWARD IV.) Henry, after a checkered career, died May 22, 1471. In his cradle, he was proclaimed king of both France and England; but he lost both, having in intellect scarcely advanced from his cradle all his days, though throughout amiable and pious.

HENRY VII., the conqueror and successor of Richard III., was b. at Pembroke Castle, the seat of his father, the earl of Pembroke, on Jan. 21, 1456. His father, Edmund Tudor, was the son of Owen Tudor, and of his wife, queen Catherine, the widow of Henry V. His mother was a granddaughter of John of Gaunt, parent of the house of Lancaster, and through her he derived his right (such as it was) to the crown. He was, indeed, the nearest heir, after Richard III. had murdered his nephews, the sons of Edward IV., except their sister Elizabeth, and Richard himself. The popular detestation against Richard's crimes was so great in England, that Henry VII., while residing abroad and bearing the title of earl of Richmond, was invited to invade England, and rescue it from the tyrant. On Aug. 7, 1485, he landed at Milford Haven, and marched across the country to Bosworth, in Leicestershire, where a battle took place on Aug. 22, in which Richard was slain. Henry VII. now ascended the throne. His reign was troubled by several impostors claiming the crown: first, Lambert Simnel, a joiner's son, who professed to be earl of Warwick, was proclaimed king in Ireland, but was defeated at Stoke in 1487, taken prisoner, and turned into a scullion in the king's kitchen by Henry VII., who had a talent for turning everything to the most profitable purpose; second, Perkin Warbeck, who pretended to be the boy duke of York, who had *not* been murdered in the tower by Richard III., and was patronized by the duchess of Burgundy, and supported by James IV., of Scotland, but was finally captured; and third, Ralph Wulfurd, who also pretended to be earl of Warwick, but did not succeed in carrying his enterprise far, being almost at once taken and hanged in 1499. In this year Henry VII., apparently to free himself from further trouble from pretenders, had Warbeck, whom he had pardoned, and the true earl of Warwick, a youth who had known captivity only all his days, convicted of a plot to recover their liberty, and executed. The execution of the latter is the chief blot in Henry VII.'s conduct, but his execution of lord Stanley, who had helped him to the throne, also showed a callous heart. Indeed this king was cunning and selfish, but prudent and not intemperate in revenge or in any vice except avarice, which led him to sell offices and pardons, commuting sentences passed by his corrupt and infamous exchequer judges, Empson and Dudley. His avarice kept him from engaging in foreign war, a very small quarrel with France being all that he attempted in that way. It also kept him from returning the dowry of Catharine of Aragon, who had married his son Arthur, prince of Wales, a boy of 14, just before he died, and led him to betroth her to his next son, who became Henry VIII., a betrothal from which flowed most important consequences. He married his eldest daughter, Margaret, to James IV., of Scotland, foreseeing that it might bring about a union of the crowns, and this was one of the most fortunate and prudent schemes of his reign. His wife having died, he was engaged looking out for another for himself, with a large dowry, when he died of consumption, on April 22, 1509. Bacon wrote a history of his reign, in which he represents him as a wise king, but does not conceal his avarice, explaining it rather by observing that the necessities and shifts of other great princes abroad set off to him the felicity of full coffers. Hume reckons his reign "the dawn of civility and science in England. Bacon says, that in it "justice was well administered, save when the king was partie." Some fresh light is thrown upon this and the preceding reign by the recent publication of state papers.

HENRY VIII., king of England, second son of Henry VII. and Elizabeth of York, was b. in 1491. On the death of his elder brother Arthur in 1502, he became heir-apparent to the throne. In his 12th year, he was betrothed to his brother's widow, Catharine of Aragon, sister of Philip I. of Spain, thus early commencing a union afterwards so fertile in evil-fortune. On his father's death, in 1509, Henry VIII. was found to possess many accomplishments with no practical ability. Leaving Dudley and Empson, the instruments of his father's economic extortions, to fall a sacrifice to popular indignation, he proceeded to squander his treasures to his own high satisfaction, and to

the great content of his people. He indolently allowed his ministers to manage everything for him, even to his marriage with Catharine. But if he knew nothing of the foreign relations of the kingdom, he could speak several languages with ease; and if he despised domestic business, never was there a monarch who presided more gracefully in the court, or behaved more gallantly at the jousts or in the hunting-field. His tastes were otherwise innocent enough. He was passionately fond of music and of display, and he indulged in no other excess than that of physical exercise, sometimes, it is said, exhausting four or five horses in the field in one day. It is especially noteworthy, that the early years of the king were spent with scarce a stain on the purity of his life.

For the first 20 years of his reign, England had no reason to be dissatisfied. The period, indeed, was not an eventful one. In the beginning of it (1513) there were two short wars—one with France, in which Terouenne and Tournay were taken, and one with Scotland, in which the victory of Flodden was won. The following years were of that calm which comes before the storm. Wolsey was then minister; and from 1515, when he was made archbishop of York and chancellor, till his fall in 1529, he is wholly responsible for the government, and it was the best governed portion of Henry VIII.'s reign. The foreign policy, it is true, was somewhat tortuous, guided to some extent, perhaps, by the aspirations of the cardinal to the triple crown; and it may be that, in his home-government, Wolsey often exhibited a Jesuitical preference for accomplishing honest ends by dishonest means. The country, notwithstanding, was kept free from foreign embarrassments, and at home justice was administered.

Of the king, it cannot be said that during this period he did anything of consequence. When satiety and diminished means had checked the pursuits of his youth, he had betaken himself to those well-known theological studies which earned for him (1521) the honor of defender of the faith. His book, in defense of the seven sacraments, against Luther, although a work of some erudition, contributed nothing to the solution of the questions it touched. Timidity in examining received opinions was accompanied by corresponding vigor in denouncing those who, possessed of more courage, had proceeded from examination to dissent.

It is impossible not to connect these theological studies with the origin of the suit between Henry VIII. and Catharine. The joyous temperament of Henry VIII. had passed away, and in its place had come discontented gloom. In his now superstitious mind the fancy dwelt, that the early deaths of all his male children had been the judgment of Providence on some sin. From these dark thoughts the queen had not the power of weaning him. Older by 6 years than he was, her beauty had faded, and, haughty in her manners, she exacted all the stately etiquette of the Spanish court from one who had at no time felt for her more affection than was due to a bride selected for him by others. The nation, too, had grown dissatisfied with the union. The prospect of a succession left to be disputed around the person of a girl—the princess Mary, who was the immediate heiress to the throne—was viewed with anxiety. Men remembered the horrors of the wars of the Roses, and feared that their children might see them repeated. The doubt as to the validity of Henry VIII.'s marriage with his brother's widow, which had been started at the time of its celebration, was one certain to be revived on the slightest occasion. A strange mixture of public spirit, religious or superstitious feeling, and selfish desire, now determined Henry VIII. to seek a divorce.

In suing for the divorce, the king unexpectedly found a zealous assistant. Wolsey saw in it a means of detaching England from the alliance with Spain, odious to him as the power that thwarted his ambition, and ruled the papacy while pretending to obey it. Already his acute mind saw that the influence of the priesthood was decaying. Enthusiast as he was, he believed he could restore it. While sounds of reformation were echoing from Germany from beyond the walls of the church, Wolsey, almost alone in England, saw the danger; but he believed there was strength enough within the church to accomplish her own amendment, and he trusted now that the lost affections of the people might be brought back by a gracious exercise of the dispensing power, freeing them from a felt danger. Already the active schemer had arranged that when the work was done, the king should marry a daughter of France, converting an old enemy into a strong ally. With such ends in view, Wolsey (1527) prosecuted the divorce before Clement.

The pope found himself in difficulty. On the one hand, Francis I. supported England; on the other, Charles V. threatened. Clement pursued the traditional policy of Rome, and temporized. To gain time, he issued a commission to cardinal Campeggio and to Wolsey to try the question. Meanwhile, Wolsey's fair projects were rendered impossible. Anne Boleyn had been for many years about court, and when Henry VIII.'s conscience grew too scrupulous to permit his cohabiting longer with Catharine, Anne lived constantly with him. When the king announced his intention of marrying her, Wolsey's desire for the divorce was at an end. The connection promised little to the nation, and he himself had every reason to dislike her, as her relatives belonged to those reformers who sought reform from without, and as such religious sympathies as could find a place in her frivolous mind leaned also to the new learning. He was now as anxious to procrastinate as Clement. The legates' court had been opened, argument had been heard; but on one excuse or another, judgment was delayed, till the changeable Clement revoked the commission, and (1529 A.D.) advocated the cause to Rome.

The revocation of the papal commission to try the divorce question, virtually ended the papal power in England, and the steps that follow are merely the working out of inevitable results. Wolsey, suspected on the best of grounds of having thwarted the divorce, was deprived of power, and a new ministry was formed (Oct., 1529), in which, for the first time, laymen held the highest places. Sir Thomas More was chancellor. The chief adviser of the king was Wolsey's old servant, Cromwell. Parliament was called, and the members, finding that royal approbation was now given to their complaints, made out a formal list of grievances against the clergy. Their humble petition to his majesty set forth how the bishops cared for nothing but the episcopal revenues, and how they converted everything, from the powers of the diocesan courts downwards, into a means of extorting money. The king solemnly sent the document to convocation, and while the reply was under consideration, the commons proceeded. Bills were passed, with little opposition, dealing with what were wont to be thought purely ecclesiastical matters, such as fixing the fees to be exacted in the probate courts, and abating some peculiarly obnoxious imposts made in performing the last ceremonies for the dead. Parliament touched the clergy more closely still when they forbade them to follow secular employments, or to hold pluralities, and enjoined them to live in their parishes and perform their duties. These bills passed the lower house with little opposition; in the upper house, where the spiritual lords were numerous, they passed with difficulty. The king gave his assent willingly. When the bills became law, they were received by the people with great satisfaction.

Though these measures were significant enough of what might follow from his refusal, the pope still delayed. Time was suffered to wear on, and nothing made progress except the unpopularity of the clergy. Rome still showing no symptoms of yielding, the king's political necessities again made him a reformer, and that of a very unscrupulous kind. He imposed a heavy fine on the clergy, under an old statute, for having recognized the legatine authority of Wolsey without express royal sanction. Going still further, the defender of the faith declared himself the head of the church, and induced the clergy to recognize the title in consideration of his graciously remitting a portion of their fine (22 Hen. VIII. c. 15).

Parliament having again met (1530), advantage was taken of the king's disposition still more to limit the clerical power. The clergy had long ago forced the state to give up to them the right to try their brethren when accused of crimes. Their theory was, that he on whom consecration had wrought its mystic office, was too high for the secular arm. The practice was, that every one who claimed the character of clerk, from the highest dignitaries of the church to the crowds of mendicant friars, escaped with small fines after committing the gravest crimes. Parliament was thought to have gone far when it enacted that all below the rank of priest should be dealt with by the ordinary courts of the realm. The same parliament passed other acts, regulating the jurisdiction of the ecclesiastical courts, and making stricter provisions against bequests to the church.

These measures, bold and unusual as they were, affected Rome only indirectly. As it was evident that something to be more closely felt was requisite, one of the pope's highest and most lucrative privileges was attacked. The pope had long maintained that no high ecclesiastical dignity could be conferred without his approval, and in return for granting it, he received the first year's fruits of the benefice. These payments, called annates, amounted to a large sum, increased even beyond its legitimate amount by the dishonorable expedient of sanctioning the appointment of none but very old men. A bill passed both houses abolishing these payments (23 Hen. VIII., c. 20). To make the measure serve its purpose more effectually, power was given to the king to call it into effect at any future time, while the hope was privately held out that this power would not be exercised if the divorce were granted.

While such measures were being passed, it may be believed that sir Thomas More held office with pain and reluctance. Finding at last his influence powerless to restrain the advancing tide of secularism, he resigned, and a ministry was formed (1532) of which Cromwell was now the nominal as well as real head. The new ministry were prepared to push measures of reform as far as the temper of the king and the nation would permit. They desired nothing better than an open rupture with Rome. Henry, on the other hand, exhausted every effort of diplomacy to preserve the alliance with the church. Embassies, intrigues, plots of all kind, in Paris and Rome, abounded in endless confusion at this time, making it impossible to determine the immediate cause of the separation, long since certain to ensue.

In the beginning of 1533, Henry either impatient at the long delay, or as others say, and as the dates render not improbable, discovering that an illicit intercourse he carried on with Anne Boleyn had resulted in her pregnancy, was privately married to her. Within three months afterwards, the marriage was made public; and to complete matters, Cranmer, recently appointed archbishop of Canterbury, held a court, as the highest ecclesiastical authority in England, and pronounced sentence of divorce, declaring the marriage of Henry and Catharine to have been null from the beginning. In England, these doings were accompanied by much rejoicing, and the king's former taste for pageantry revived in the magnificent ceremonial of crowning his new queen.

The news produced other effects in Italy and Germany. When the news of the

marriage reached the vatican, Henry was cited to appear before the papal court. He refused, and appealed to a general council. When Cranmer's sentence reached Rome, the pope at once declared it illegal, and soon after, almost closed the door for further negotiation by rejecting the appeal to the council. The next steps on each side were taken almost simultaneously. The English parliament met, and under Cromwell's guidance, far outdid its predecessors. It passed an act entirely abolishing the papal authority within the realm (24 Hen. VIII. c. 12), giving the king, as on a former occasion, power to call the act into operation when he pleased. It then settled the succession on the issue of Anne Boleyn, to the exclusion of that of Catharine. Scarcely had these measures passed, when news came from Rome that the pope had pronounced judgment in the long pending divorce case, finding Henry's marriage to Catharine to have been valid. On the day following Henry called into operation the act abolishing the pope's authority.

Henry having as yet done comparatively little to forfeit his early popularity, the sympathy of most was with him in the steps taken against those of his subjects who were disaffected with these changes. Among these steps, however, were some not easily defended, even according to the standard of the times. Minor victims fell unheeded, but all Europe was shocked when More and Fisher (bishop of Rochester) were put to death for refusing to acknowledge the new succession, and to admit the king's right to the headship of the church. Even Henry's ally, Francis I., remonstrated. The worst effect of the cruelty was the alienation of the German Protestants, who ever afterwards held aloof from Henry in spite of all Cromwell's efforts to cement an alliance. After this and other similar acts, which were not unfrequent, it may be said that Henry never again received human sympathy. He pursued his course, however, aided by those from whom the dust of the conflict concealed his cruelty.

The state of the monasteries having long been a public scandal, Cromwell (1535) sent a commission to examine them. Acting on the reports of the commission, parliament abolished the smaller monasteries, which happened to be at once the weakest and the worst (27 Hen. VIII. c. 28). The disbanded monks made a large addition, both directly and indirectly, to the ranks of the disaffected; and to create further discontent, the swarms of vagabonds who had subsisted on the monastic alms were suddenly thrown for support on the yeomen.

The disaffection burst out in the rebellion known as the pilgrimage of grace (1536). Crowds who had collected in Lincolnshire with hardly a definite aim, dispersed on the promise of redress in a parliament to be held at York. Redress, however, came not, and the crowds again gathered, this time under more skillful leaders, and with more definite purposes. The king's forces sent against them were insufficient. The whole of the north of England was in the hands of the rebels. Their grievances were a strange medley. Complaints of the law regarding the tenure of land were mixed with complaints that low-born men (such as Cromwell) advised the king, that the monasteries were being dissolved, and that the old faith was being altered. Henry, through certain commissioners, again negotiated with the insurgents, and terms were agreed on, the most important of which was a general amnesty, the benefit of which, however, Aske and the other leaders did not receive. The suppression of this rebellion was followed by the dissolution (in 1537) of the larger monasteries (31 Hen. VIII. c. 13).

In the midst of these civil commotions, two events took place, both bearing on the reformation, but of a very different import. An order in council (1537) appointed the English translation of the Bible to be placed in every church, that all might read it. But as if to correct the idea that every one was thus to have the right of judging for himself in religious questions, an act of uniformity was passed. Henry having now broken with many old professions, reduced his new professions to a creed, to be enforced by penalties, if more rational means should fail to commend it to the nation. Certain articles of religion were drawn up, and after some modifications, were framed into those known as the "bloody six articles." The statute (31 Hen. VIII. c. 14) containing these articles—named, with much simplicity, "An act for abolishing diversity of opinions"—is very brief but very formidable. The doctrines were substantially those of the Roman Catholic church. The articles made no pretensions to form a complete or systematic creed; they embodied the points as to which most conflict of opinion prevailed; and formidable, indeed, were the sanctions enforcing them. Whoever denied the first article (that embodying the doctrine of transubstantiation) was to be declared a heretic, and burned without opportunity of abjuration; whoso spoke against the other five articles should, for the first offense, forfeit his property; and whosoever refused to abjure his first offense, or committed a second, was to die like a felon. To this act Cromwell himself fell a victim. He had been silent in face of the combination which carried it; but having secretly used all his influence as a member of government to thwart its execution, by staying proceedings and giving pardons, he lost Henry's confidence, and was put to death.

The last years of the reign of Henry were disturbed with small wars with Scotland and France, inimical to progress. He died on Jan. 28, 1547, unhonored, unmourned; and yet few rejoiced, for his policy had left England so divided at home, so friendless abroad, that no man could look with confidence to the future.

The character of Henry has of late been discussed at greater length than the subject

deserved. The mere recital of the occurrences of his private life is sufficient to justify most of the infamy which tradition has attached to his name. The divorce of Catharine and the marriage of Anne Boleyn have already been told. Within a short time after the birth of the princess (afterwards queen) Elizabeth, Henry's affection for Anne ceased. He suspected her—not, it must be admitted, without ground—of adultery, and after a hurried trial, had her condemned and executed (1536). On the day after the execution, he married Jane Seymour, against whom nothing more is known than that she was the king's partner in this revolting proceeding. Jane Seymour died (1537) in giving birth to Edward VI. The story of Anne of Cleves follows. The marriage, a political one, arranged by Cromwell to connect Henry with the German Protestants, was unfortunate from the beginning. Henry was deceived as to her personal attractions, and (1540) obtained a divorce to free himself. His fifth wife, Catharine Howard, was (1541) within a few months divorced and executed for an adultery well enough established. His sixth wife, Catharine Parr, survived him, and so the catalogue ends. Passing from the domestic circle to that of his immediate associates, Henry is found as incapable of friendship as he was either of feeling or of evoking love. He had three great ministers—Wolsey, More, and Cromwell—all men of high talent and worth, and all on terms of the closest intimacy with the king, yet all in the hour of need thrown aside. Disease and a broken spirit saved Wolsey from a worse fate; but it is little wonder that every Catholic should detest the memory of him who sent More to the scaffold for adhering to opinions which he himself had held shortly before, or that Protestants should execrate the memory of the man who violated justice and consistency to put to death the first great Protestant minister. If such were the mercies he vouchsafed to those who were with him, it may easily be imagined how he dealt with those who were against him. Claims of political necessity cannot excuse the cruelty with which he persecuted every relative of cardinal Pole, from the aged countess of Salisbury to lesser victims. It may, however, be safely admitted, that tradition has exaggerated Henry's cruelties—that there is no truth, for example, in the tale which gives 73,000 as the number of executions in his reign; and it may be further admitted that he did not wantonly commit murders—that he had always before him in his crimes some object, either of misconceived justice, or of policy; but after allowing for everything, enough remains to explain the universal detestation in which Protestant and Catholic have combined to hold his name.

HENRY I., 1005-60; king of France, grandson of Hugh Capet. On the accession of his mother (Constance of Aquitaine) who favored her youngest son (Robert) Henry took refuge at the court of duke Robert II. of Normandy. With the duke's help he soon compelled her to acknowledge his rights. Constance died in 1032, and Henry, by granting the duchy of Burgundy to his brother, secured his good-will. After the death of Robert "the devil," Henry, who had first supported William the bastard, in 1053 and 1054, tried to weaken the power of the Normans. Leaguing himself with the count of Anjou, and calling his brother Eudes into the field, he invaded Normandy from Evreux. When, however, Eudes had been defeated at Mortemer, Henry drew back in haste, and left the Normans to themselves. In 1059 he caused his eldest son Philip to be crowned as joint king, and died in 1060. He was an active prince, with his sword rarely in the scabbard. Henry's acts and character did little to strengthen the monarchy. The Normans were independent of him, with their frontier barely 25 m. w. of Paris; while to the s. his authority was bounded by the Loire, and in the e. the count of Champagne was only nominally his subject. Henry's first wife Maud, daughter (or niece) of Conrad the Salic, died childless; his second, Anne, daughter of Jaroslay, granduke of Russia, bore him two sons—Philip his successor, and Hugh, count of Vermandois.

HENRY II., king of France, was b. in 1518; married Catharine de' Medici in 1533; succeeded his father, Francis I., in 1547. The money which his father left was rapidly squandered among his favorites and mistresses. A revolt in Guienne, where the people had risen against the *gabeleurs*, or collectors of the salt-duty, was the first event that roused the king and court from their slothful ease. This disturbance was, however, speedily put down by Montmorency. Through the influence of the Guises, whose sister, the dowager-queen of James V., sought the aid of France to support her against the ambitious designs of the English government, a French alliance was cemented with Scotland, and war declared against England, which began in 1550 with the recovery of Boulogne, and ended in 1558 with the taking of Calais, after that city had been 210 years in the hands of the English. Curiously enough, while the king tried to put down heresy with fire and sword at home, he made treaties of alliance with the German reformers, and sent an army of 38,000 men to aid Maurice of Saxony against the emperor; and taking the command in person, made himself master of Toul and Verdun, while Montmorency, through the treachery of the garrison, seized upon Metz. After the abdication of Charles V. (1556), and the division of his vast empire between his brother Ferdinand and his son Philip II., Henry seized the opportune occasion of attacking the Netherlands and Italy before Philip II. had time to consolidate his newly acquired powers, but the results of this step were disastrous to France at every point. In Italy, the attack on Naples, made by Guise at the head of 20,000 men, utterly failed

through the pusillanimity of the pope, and the energetic advance of Alva; while in the low countries, the French under Montmorency sustained a total defeat, in 1557, at St. Quentin, where the flower of the French chivalry were either slain or taken captive by the troops of Philip, who were commanded by Philibert-Emmanuel, duke of Savoy.

These reverses were followed by the treaty of Château-Cambresis (1559), in which Henry agreed, in exchange for the restoration of Ham, St. Quentin, and Castelet, and the liberation of Montmorency, to resign nearly all his conquests in the low countries, Piedmont, and southern Italy, including 190 fortresses and strongholds. Shortly after, he was mortally but accidentally wounded in a tournament by count Montgomery, a Scottish nobleman, and capt. of his guard. He died July 10, 1559.

HENRY III., the third son of Henry II. and Catharine de' Medici, was b. in 1551, and succeeded his brother Charles IX. in 1574. On the death of the constable Montmorency, he received the chief command of the army, and his first campaign, fought in his 16th year, was signalized by two decisive victories, gained over the Protestants at Jarnac and Moncontour. In 1573 the intrigues of the queen-regent secured to him the election to the vacant throne of Poland. He failed, however, to secure the attachment of the Polish nobles; and on receiving the tidings of his brother's death, he fled by night from Cracow, and on his return to France, was proclaimed king of that country. His mother and the Guises had little difficulty in persuading him to continue the religious civil war. The union of the Protestants with the party of discontented nobles, headed by the king's brother, the duke d' Alençon, compelled the alarmed sovereign to grant the former the free exercise of their religion, and various other rights. This exasperated the Catholic party, who, headed by Henry of Guise, formed the confederation known as the *Sainte Ligue*, the object of which was not merely to assert the undivided supremacy of Catholicism, but also to secure the reversion of the throne to Guise, and civil war again and again burst out with renewed violence.

Henry availed himself of his intervals of quiet to indulge his own vicious propensities; and while his mother ruled the state, and the Guises were undermining his throne, his days and nights were spent in an alternation of the most dissolute excesses, and the wildest outbreaks of fanaticism. One day he might be seen passing, to the sound of music, through the streets of Paris, accompanied by a band of young men as effeminate as himself, known as the mignons, and surrounded by parrots, monkeys, and pet dogs, while the next day he and his companions would show themselves clad in a penitent's dress, wearing masks, and carrying in their hands scourges, with which they flaggelated one another as they sang aloud penitential psalms.

The assassination of the duke of Guise in 1588 finally aroused the hatred of the nation. The doctors of the Sorbonne declared the people to be relieved of the duty of obedience to the king, and the leaguers dissolved the parliament. Henry, who was now, for the first time, thrown on his own resources—his mother had just died—was distracted by the difficulties of his position; and in his perplexity at hearing that Guise's brother, the duke of Mayenne, had been declared lieut.gen. of the kingdom, threw himself under the protection of Henry of Navarre. The newly reconciled kings advanced at the head of 40,000 Huguenots on Paris, which, although gallantly defended by Mayenne, would probably have had to capitulate, had not the current of events been suddenly checked through the agency of a fanatical young Dominican-brother, named Jacques Clement, who, on Aug. 1, 1589, on pretense of having important tidings to communicate to Henry, killed him by plunging a knife into his body. The murderer was slain on the spot by the royal guard, and his victim died the following day, after having declared his kinsman, Henry Bourbon of Navarre, his successor.

HENRY IV., king of France and Navarre, surnamed "The Great," and "The Good," was born in Bearn in 1553. Henry was the third son of Antoine de Bourbon and Jeanne d'Albret, daughter and heiress of Henry, king of Navarre and Bearn. His father's death placed him under the sole control of his mother and grandfather, at whose court he was trained to the practice of knightly and athletic exercises, and inured to the active habits and rude fare common to the Bernais mountaineers. His mother, who was a zealous Calvanist, was careful to select learned men holding her own tenets for his instructors; and having discovered that a plot was brooding to remove him to Spain by force, to train him in the Catholic faith, she conducted him, in 1569, to La Rochelle, and presented him to the assembled Huguenot army, with whom he participated in the battle of Jarnac. Henry was now chosen chief of the Protestant party, although, on account of his youth, the principal command was vested in Coligny (q.v.). Notwithstanding the defeats which the Huguenots had experienced in this campaign, the peace of St. Germain which followed was apparently most advantageous to their cause, and was speedily followed by a contract of marriage between Henry and Margaret of Valois, the sister of Charles IX. After much opposition on the part of both Catholics and Protestants, the marriage was celebrated with great pomp in 1572, two months after the sudden death of the queen Jeanne, which was probably due to poison, and within less than a week of the massacre of St. Bartholomew. It had been originally intended that Henry was to share the fate of his friends and co-religionists; but his life was spared on condition of his professing himself a Catholic. Three years he remained at the French court, virtually a prisoner; but at length, in 1576, Henry contrived to elude the vigi-

lance of the queen-mother, and escaped to the camp of the Huguenots in Alençon, where, having revoked his compulsory conversion, he resumed the command of the army, and by his address gained several signal advantages, which constrained the king to consent to a peace highly favorable to the cause of the reformers. The death of the duke of Anjou (late Alençon) gave Henry the rank as first prince of the blood-royal, of presumptive heir to the crown, while the murder of Henry III., in 1589, made him, in right of the Salic law, and as the nearest lineal male descendant of the royal house of France, rightful king of France. As a Protestant, lying under the ban of papal excommunication, he was obnoxious to the greater part of the nation; and finding that the dukes of Lorraine and Savoy, and Philip II. of Spain, were prepared, each on his own account, to dispute his claims, he retired to the south until he could collect more troops and obtain reinforcements from England and Germany. His nearly hopeless cause, however, gradually gained strength through the weakness and internal dissensions of the Liguists, who, in their anxiety to circumvent the ambitious designs which Philip II. cherished in favor of his daughter (niece of Henry III.), notwithstanding her exclusion by the Salic law, proclaimed the aged cardinal Bourbon king, with the duke of Mayenne lieutenant-general of the kingdom, and thus still further complicated the interests of their party. In 1590 Henry won a splendid victory over Mayenne at Ivry. In 1593 the assembly of the states-general, by rejecting the pretensions of Philip II., and insisting on the integrity of the Salic law, smoothed Henry's way to the succession, although it is probable that he would never have been generally acknowledged had he not, by the advice of his friend and minister, De Rosny, afterwards duke de Sully (q.v.), formally professed himself a member of the church of Rome. The ceremony of his recantation of Protestantism, which was celebrated with great pomp at St. Denis in July, 1593, filled the Catholics with joy, and was followed by the speedy surrender of the most important cities of the kingdom, including even Paris, which opened its gates to him in 1594. The civil war was not, however, wholly put down till four years later. In the same year, 1598, peace was concluded between Spain and France by the treaty of Vervins, which restored to the latter many important places in Picardy, and was otherwise favorable to the French king; but important as was this event, it was preceded by a still more memorable act, for on April 15, Henry had signed an edict at Nantes, by which he secured to Protestants perfect liberty of conscience, and the administration of impartial justice. Henry was now left at liberty to direct his attention to the internal improvements of the kingdom, which had been thoroughly disorganized through the long continuance of civil war. The narrow-minded policy that had been followed during the preceding reigns had left the provinces remote from the capital very much at the mercy of the civic governors and large landed proprietors, who, in the absence of a general administrative vigilance, arrogated almost sovereign power to themselves, raising taxes, and exacting compulsory services. These abuses Henry completely stopped, and by making canals and roads, and thus opening all parts of his kingdom to traffic and commerce, he established new sources of wealth and prosperity for all classes of his subjects. The mainspring of these improvements was, however, the reorganization of the finances under Sully, who, in the course of ten years, reduced the national debt from 330 millions to 50 millions of livres, although arrears of taxes to the amount of 20 millions were remitted by the king during that period. On May 14, the day after the coronation of his second wife, Mary de' Medici, and when about to set out to commence war in Germany, Henry was assassinated by a fanatic named Ravaillac. Nineteen times before attempts had been made on his life, most of which had been traced to the agency of the papal and imperial courts, and hence the people, in their grief and consternation, laid Ravaillac's crime to the charge of the same influences. The grief of the Parisians was well-nigh delirious, and in their fury they wreaked the most horrible vengeance on the murderer, who, however, had been a mere tool in the hands of the Jesuits, Henry's implacable foes, notwithstanding the many concessions which he made to their order.

Time has strengthened the high estimate which the lower classes had formed of their favorite king, for although his faults were numerous, they were eclipsed by his great qualities. Inordinate love of women was his worst fault, and the cause of much evil in his own and succeding reigns, for his prodigality and weak indulgence to his favorite mistresses, Gabrielle d'Estrées and Henrietta d'Entragues, and his affection for the natural children which they bore him, were a scandal to the nation, and a source of impoverishing embarrassment to the government. As authorities in regard to Henry II., III., and IV., in addition to the general histories of France, the following works may be consulted: Anquetil, *Esprit de la Ligue;* Petitot's *Collection of Mémoires;* De la Saussaye, *Histoire de Blois; Documents de l'Hist. de France;* Matthieu, *Hist. de Henri IV.;* Memoirs and letters of De Thou, D'Aubigné, Pasquier, Duplessis-Mornay; Capefigue, *Hist. de la Réforme et de la Ligue;* Péréfixe, *Hist. de Henri IV.*

HENRY I., 876–936; king of Germany, son of Otto duke of Saxony. Henry was distinguished in early youth for the courage and energy with which he warred against the Slavonic tribes to the east of his native duchy. Otto, who died in 912, appointed Henry his successor, not only as duke of Saxony, but as lord of Thuringia and part of Franconia. Conrad I. stimulated by certain ecclesiastical advisers whom Henry's inde-

pendent bearing towards the church had deeply offended, resisted the claims of the young duke; but he was ultimately left in possession of all the lands over which his father had ruled. After Conrad's death Henry was chosen king by the Franconian and Saxon nobles, and he had not much difficulty in securing the acquiescence of the rest of Germany. For some years Lotharingia or Lorraine had held an uncertain position between the kingdoms of the East and the West Franks, as Germany and France were then called; but at this time duke Giselbert, who was an old friend of Henry, quarreled with Charles the simple, and transferred his allegiance to the German king. For eight centuries afterwards Lorraine remained a part of Germany. From the time of Louis the child, Germany had been tormented by the Hungarians, who were still a savage race, and who had the advantage of fighting on horseback while the Germans resisted them on foot. In 922 a Hungarian chief was captured, and his people were compelled to purchase his release by agreeing to a nine years' truce, on condition that Henry should during this time pay an annual tribute. In the n. districts the Germans had hitherto lived for the most part in small villages or on separate settlements. Henry began building fortified cities throughout Saxony and Thuringia, and in the remaining duchies his example was extensively followed. He also trained his vassals to meet the enemy on horseback, thus giving a strong impetus to the movement which resulted in the institutions of chivalry. When his arrangements were complete he tried his new force in a contest with the Danes and with some Slavonic tribes, whom he utterly defeated. In 933 the Hungarians demanded as usual the tribute which had till then been punctually paid, and when it was refused invaded Thuringia with a great army. Henry twice defeated them, and they were so overwhelmed by this misfortune that they did not enter Germany for some years, and were never again seen in the northern duchies. Having broken the power of his chief enemies, Henry established the marches of Schleswig, of Meissen, and perhaps of Brandenburg. In his home government he acted with great precaution and judgment. The dukes had become so powerful that there was some danger of their altogether overshadowing the throne. Instead of directly forcing them to submission, as was afterwards done by his son Otto, he attached them to his interests by confirming them in many of their rights and by acting as a mediator in their disputes. Towards the close of his life his position was so secure that he resolved to go to Rome and claim the imperial crown. In the midst of his preparations he died.

HENRY II., SAINT, 972–1024; emperor of Germany, grandson of Henry I. He was crowned at Mainz, June 7, 1002. His most determined enemy during the greater part of his reign was Boleslaus II. of Poland, who annexed Bohemia, and during the king's absence in Italy broke into Lusatia and Meissen. Henry hurried back, defeated Boleslaus, in 1005, and granted Bohemia fief to Jaromir, son of the previous duke. Boleslaus, however, continued the war, which was not ended until 1018, when Henry was obliged to conclude peace on terms more favorable to Poles than he would voluntarily have granted. In the midst of this struggle he had to make war on Adalbero, his wife's brother, who seized the archbishopric of Treves, and was protected in his claim by another brother of the empress, the duke of Bavaria. Both were overcome, and deprived of their dignities, although Bavaria was ultimately restored to the elder of the two brothers. Henry also put down rebellions in Flanders and Meissen, and concluded an important treaty with Rudolf III. of Burgundy, whereby after Rudolf's death the country was to be united to Germany. In 1013 Henry went for the second time to Italy, where Harduin had again raised himself to the throne. The usurper was displaced, and in 1014 Henry was crowned emperor at Rome by Benedict VIII.; whom he had confirmed in the papal see in opposition to the anti-pope Gregory. At the request of Benedict the emperor returned to Italy in 1022 in order to drive back the Grecks who were steadily pressing northwards. In this enterprise he associated himself with the Normans, who thus became one of the most important factors in the political life of Italy. Henry was canonized by pope Eugenius III.; and at a later time his wife, Cunigunde, was also ranked among the saints. The church has rarely had a more splendid benefactor than Henry II., whose ruling policy was to counter-balance the power of the great nobles by increasing that of the spiritual princes. He also founded the bishopric of Bamberg, which was placed under the immediate jurisdiction of the pope, and to which he left by will all his treasure and his magnificent allodial possessions.

HENRY III., emperor of Germany, of the Salo-Franconian line, and the son of the emperor Conrad II., was b. in 1017, elected king of the Germans in 1026, duke of Bavaria in 1027, duke of Swabia and Burgundy in 1037, succeeded his father as emperor in 1039, and died in 1056. Henry III., who was possessed of natural abilities, which had been cultivated as far as the age permitted, was one of the most energetic and efficient rulers of Germany. By his vigor he maintained his ascendency notwithstanding the encroachments of the church and the subordination of the princes of the empire. Having summoned a council at Sutri in 1046, he availed himself of the influence which he had acquired in Italy, by his judicious reconciliation of antagonist parties, to secure a recognition of a new pope, Clement II., and thus brought to an end the scandalous dissensions which were disturbing Christianity through the intrigues of three rival popes, Benedict IX., Sylvester III., and Gregory IV. By his energetic

maintenance of the integrity of the empire, he gained opportunities of adding new territories to the imperial states, for having retaliated on the duke of Bohemia for the hostilities which he had carried on against the Poles during the intestine disorders of Poland, his decisive successes compelled the Bohemian duke to acknowledge himself vassal of the empire; while Henry's campaign against Hungary had a similar result, terminating in 1047 in the recognition of the supreme power of the emperor over the kings of Hungary. He also secured powerful vassals in Italy, in the Norman conquerors of Apulia and Calabria.

Henry devoted the short intervals of peace which he enjoyed to the eradication of numerous abuses in the church, but his schemes of ecclesiastical reform were secretly frustrated by Hildebrand, afterwards Gregory VII. (q. v.); and on the sudden death of Henry, who is supposed to have been poisoned, the papal chair was found to have already entered upon decisive measures for its emancipation from imperial influence. Henry distinguished himself as the zealous promoter of learning and the arts, especially music. He also founded numerous monastic schools, over which he placed learned monks of Brittany, and built several churches, and the cathedrals of Worms, Mayence, and Spires, in the last of which he was interred.

HENRY IV., emperor of Germany, the son and successor of the former, was b. in 1050, elected king of the Germans in 1054, during the lifetime of his father, crowned emperor 1084, and died 1106. As he was only 5 years old at the death of his father, the regency was, in accordance with the wishes of the latter, confided to the child's mother, Agnes of Poictiers. Henry's perpetual quarrels with the Saxon princes and peers occupied his best years, and were the principal cause of the subsequent troubles and mortifications which have given a memorable interest to his history. Unhappily for him, he was induced in 1074, after having suffered defeat and various insults at the hands of his Saxon vassals, to appeal to the pope for his intervention; and Gregory VII., who was only too happy to have an opportunity of interfering in the matter, despatched plenipotentiaries to settle the differences in Saxony, and availing himself of the occasion to prosecute his own plans, commanded the king to abstain from the sale and granting of benefices while this quarrel was pending. Before these directions reached Germany, Henry had, however, settled his own affairs by defeating the Saxon insurgents in a great battle at Hohenburg, taken their princes captive, and rebuilt all the strongholds which they had dismantled; while his councilors had prosecuted a vigorous business in the interdicted sale of benefices. Henry not only approved their conduct, but responded to the pope's remonstrances on the subject, and his summons for his appearance at Rome, by declaring, through an assembly of German bishops and abbots, which met at Worms in 1076, that the pontiff was deposed. Gregory VII. retaliated by excommunicating and deposing Henry, and absolving his subjects from all future obedience towards him. The king at first made light of the sentence, but when he found his vassals and princes gradually falling away from their allegiance, while the electors held a diet in which they declared that unless the ban were removed within a twelvemonth, they would deprive him of the crown, he submitted; and accompanied only by his faithful consort and their eldest son, he hastened, under grievous difficulties, in midwinter, to Italy, where he sought the pope. For three days in Jan., 1077, Henry IV., barefooted, and clothed only in the haircloth shirt of a penitent, was compelled to stand without the castle gates of Canossa, exposed to the inclemency of the weather, before the pontiff consented to remove the ban of excommunication.

After this event Henry's courage and resentment speedily revived; and having found adherents among the Lombards, he began a conflict against the papal power, chiefly in regard to the right of investiture, in which he was generally successful. Gregory again excommunicated Henry, who, as usual, retaliated by electing a new pope, Clement III. Hastening over the Alps, he laid siege to Rome. Gregory took refuge in the castle of St. Angelo, and Henry caused himself to be crowned emperor by the anti-pope; but finding that Hermann of Luxemburg had, during his absence, been elected king of Germany, he hastily left Rome to regain his lost power. For the third time Henry crossed the Alps in 1090, and he had already succeeded in raising the fortunes of his friend, Clement III., taken Mantua, and gained many victories over the Guelphic princes and their favorite pope, Urban II., when he suddenly learned that his son Conrad had joined his enemies, and been crowned king at Monza. Henry's despair on hearing of these acts of rebellion nearly unsettled his reason, and having retired to one of his Lombard castles, he remained for several years in seclusion; but at length rousing himself from his lethargy, he returned in 1096 to Germany, where the princes and people now vied with one another to show him their sympathy and good-will. By his own request, his second son Henry, was elected the king of the Germans, and his successor in the empire. This prince, however, having been induced to rise against his father by Pope Pascal II., took him prisoner, and forcibly compelled him to abdicate. The emperor escaped from his prison, and found friends and safety at Liege, where he died, Aug. 7, 1106, while preparing another army to continue the struggle. See, for the lives of Henry III. and IV., Adamus Bremensis, *Historia Ecclesiastica;* Sismondi, *Italian Republics;* and *Europe during the Middle Ages;* Söltl, *H. IV.;* Minckwitz, *Die Büsse Heinrichs des IVten* (1875).

HENRY V., 1081–1125; emperor of Germany. In 1098 his elder brother, Conrad, having forfeited his right to the throne by rebellion, Henry was appointed his father's successor. Six years afterwards he himself rebelled against the emperor. The papal party, with which he allied himself, took for granted that when he mounted the throne, church and state would instantly be reconciled; but their hopes were disappointed. The main point for which Henry IV. had contended was the right of investing the bishops with ring and staff. When Henry V. succeeded him in 1106, pope Pascal II. demanded that this right should be given up, but he replied that he could not resign powers that had been exercised by his predecessors, and the loss of which would imply that the ecclesiastical lands of Germany would be removed from secular control. In 1110 he entered Italy at the head of 30,000 men. Alarmed by this display of force Pascal withdrew his claims, and a day was appointed for the coronation of Henry as emperor. The opposition of the Roman prelates made it impossible for the pope to proceed with the ceremony, whereupon he and his cardinals were made prisoners. Pascal then formally recognized the right of investiture, and Henry received the imperial crown. When the Germans had recrossed the Alps, Pascal renounced the treaty he had concluded, and the emperor was excommunicated. As many of the princes were pleased to find this opportunity for rebelling, Germany again became the scene of confused contests like those which had plunged it in misery during Henry IV.'s long reign. In 1116 the emperor went a second time to Italy and drove Pascal from Rome; and after Pascal's death he caused Gregory VIII. to be appointed pope. The extreme papal party, however, selected Gelasius II., who renewed the sentence of excommunication against Henry. The latter returned to Germany in 1119, and at a diet in Tribur succeeded in allaying the hostility of the more important among his enemies. Pope Calixtus II., who succeeded Gelasius in 1119, now found it necessary to offer a compromise; and the controversy between the empire and the papacy was for the time closed by the concordat of Worms, 1122, in which it was agreed that at every election of a prelate the emperor should have the right of being present either in person or through a representative, and that the chosen bishop, before being consecrated, should receive his lands and secular authority in fief of the crown. So far the advantage rested with the emperor; but the papacy gained by being recognized as a power which had the right of negotiating with the empire on equal terms, and by the acknowledgment of the claim of the church to nominate its own rulers. Notwithstanding this settlement Germany did not long enjoy peace, for a number of petty wars broke out which Henry was not strong enough to quell.

HENRY VI., 1165–97, emperor of Germany, crowned in 1169. He shared the intellectual culture of his time, and was distinguished for the splendor of his political schemes; but he was of a stern disposition, and in order to attain his ends was sometimes guilty of horrible cruelty. Henry the lion, who had been banished to England by Frederick I., returned to Germany after the departure of the latter for the Holy Land. Henry resisted him, but on becoming the reigning sovereign he concluded peace, and hastened to Rome, where he was crowned emperor in 1191. Through his wife Constantia he had a right to the throne of Sicily; but the Sicilian nobles had made count Tancred, an illegitimate son of Constantia's brother, king. After receiving the imperial crown Henry advanced against Tancred, and the whole of southern Italy, except Naples, was quickly in his possession. Before Naples his army was struck by pestilence, and he was forced to return to Germany. There he suppressed various private wars, and compelled Henry the lion to acknowledge his supremacy. The great ransom which he received from Richard I. of England enabled him to fit out a fine army, and with this he descended upon Italy in 1194, and without much difficulty conquered the Sicilian kingdom. Tancred was dead, but he had left a number of relatives, who were so barborously treated that the people were seized with terror, and not even the sentence of excommunication which the pope pronounced against Henry could induce any one to express dissatisfaction with his rule. On his return to Germany it was easy for him, with the prestige which he had now acquired, to enforce submission; and so great was his authority that, in 1196, he endeavored to secure a declaration that the crown should be declared hereditary in his family. Had he lived some years longer he would probably have succeeded, but in 1197 he died in Messina.

HENRY VII., 1282–1313; emperor of Germany, elected in 1308. When he came to the throne Bohemia was subject to Henry of Carinthia, whom the people extremely disliked. The king at once displaced him, and enriched his own family by granting Bohemia, at the request of the Bohemians themselves, to his son John, whose claims were rendered secure by his marriage with Elizabeth, the daughter of Wenceslaus II. For some time no German king had sought the imperial crown; but Henry resolved to revive the traditions which were dying out, and with a view to this result did what he could to compose the differences between the nobles and to gain their allegiance. At this time there were signs of rapid progress among the cities, and had a strong king devoted himself to their interests, he might have established his throne on a solid basis. Unfortunately the easiest way in which Henry could obtain immediate scope for his plans in Italy was to ally himself with the princes against the cities, and this was, in most instances, the course which he adopted. His visit to Italy was

looked forward to with great eagerness by the Ghibellines. He held aloof at first from both the great parties in the state. In 1312 he was crowned emperor in Rome, having previously received the iron crown in Milan. But while he was in Rome, Robert of Naples was there also with a strong army, and in order to obtain adequate support it was necessary for Henry to declare himself on the side of the Ghibellines. He then resolved to conquer Naples, but while advancing on this expedition he died at Buonconvento. It was generally believed at the time that he had been poisoned by a Dominican monk, but this was not proved by satisfactory evidence.

HENRY, surnamed THE LION, duke of Saxony, is the most notable German prince of the 12th century. He was the son of Henry the proud, and was born in 1129. When only ten years of age he lost his father by poison, and for the next seven years his mother, Gertrude, and his grandmother, Richenza, ruled his paternal dominions, while his uncle, Welf (Guelf), administered the hereditary fiefs of Bavaria. In 1146 Henry himself took the reins of government, and at the diet of Frankfort, in the following year, he demanded of the emperor Conrad the restoration of the whole duchy of Bavaria, which had been wrested from his father. This was refused, and Henry at once, in concert with his uncle, had recourse to arms; but his efforts were crushed by the energetic measures of Conrad. After the death of this emperor, however, Bavaria was given up to him by his cousin, the emperor Frederick I. His possessions now extended from the North sea and the Baltic to the shores of the Adriatic. Eastphalia and Westphalia, with Engern, and the old duchy of Saxony from the Rhine to the Elbe, acknowledged his authority. The greater part of Bavaria belonged to him as a hereditary fief, while his Italian vassals in the Guelfic dominions beyond the Alps took the oath of allegiance to him in 1157. In 1166, under the direction of Hartwig, archbishop of Bremen, a league, comprising the bishops of Magdeburg, Halberstadt, and Hildesheim, and the markgrafs of Thuringia and Brandenburg, was formed against him; but the capture of Bremen, and the storming of Oldenburg by Henry, paralyzed its designs. About this time he separated from his first wife, and married Matilda, daughter of Henry II. of England, soon after which event he undertook an expedition to Palestine. During his absence his enemies were not idle, and even the emperor Frederick displayed a decided want of good faith, conduct which Henry, some time after his return, showed he had not forgotten, by quitting the imperial army during an Italian campaign, and thereby causing Frederick to lose the battle of Legnano, and forcing him to conclude a disadvantageous treaty. The emperor was indignant, and at the diet of Spires, in 1178, spoke strongly against the duke. The numerous enemies of the latter again combined against him; he was summoned to appear at three different diets, and refusing, was put under the ban of the empire. By 1182 his fortunes were at so low an ebb that he was forced to ask mercy of the emperor at Erfurt; but all that he could get was permission to retain his hereditary territories of Brunswick and Luneburg, and even this was on the condition of his going into exile for three years. Henry, in consequence, betook himself with his family to England, but returned to Brunswick in 1184, where he lived quietly. On the departure of Frederick for Palestine in 1188, Henry was again necessitated to withdraw to England, but returned in 1189, and after a year's fighting, a peace was concluded between him and his enemies, by which a portion of his former territories was restored to him. He died at Brunswick in 1195. Henry was a brave and generous prince, of indefatigable activity, but obstinate and passionate. What raised him above the princes of his time was his efforts to advance the commerce, industry, and comfort of his people, and to foster literature and science. Compare Böttiger's *Heinrich der Löwe Herzog der Sachsen und Baiern* (Hannov. 1819).

HENRY, surnamed THE NAVIGATOR, a famous Portuguese prince, the fourth son of John I., king of Portugal, was b. at Oporto in 1394, and first distinguished himself at the conquest of Ceuta in 1415. After the death of his father he took up his residence at the t. of Sagres, in Algarve, not far from cape St. Vincent; and while prosecuting the war against the Moors of Africa, his sailors reached parts of the ocean which the navigation of the time had long supposed to be inaccessible. The grand ambition of Henry was the discovery of unknown regions of the world. At Sagres he erected an observatory, to which he attached a school for the instruction of youthful scions of the nobility in the sciences necessary to navigation. Subsequently, he despatched some of his pupils on voyages of discovery, which resulted at last in the discovery of the Madeira islands in 1418. Henry's thoughts were now directed towards the auriferous coasts of Guinea, of which he had heard from the Moors; and in 1433 one of his mariners sailed round cape Nun, unil then regarded as the furthest point of the earth, and took possession of the coasts as far s. as cape Bojador. Next year Henry sent out a larger ship, which reached a point 120 m. beyond cape Bojador; and at last, in 1440, cape Blanco was reached. Up to this period Henry had borne all the expense of these voyages himself; henceforth, self-supporting societies were formed under his patronage and guidance, and what had formerly been the affair of a single individual, now became the passion of a whole nation. But Henry did not slack personally in his efforts. In 1446 his captain, Nuno Tristan, doubled cape Verd in Senegambia, and in 1448 Gonzalez Vallo discovered three of the Azores. Henry died in 1463, after he had the satisfaction of learning that his mariners had reached as far south as Sierra Leone. See Wap

päus, *Untersuchungen über die Geogr. Entdeckungen der Portugiesen unter* Henry, *dem Seefahrer* (Gött. 1842). See also Barros and Candido Lusitano; Major's *Life of Prince Henry of Portugal* (Lond. 1868); and the same author's *Discoveries of Prince Henry the Navigator* (1877).

HENRY THE DEACON, variously known as of Cluny, Lausanne, and Toulouse. He was born towards the close of the 11th c., abandoned the cloister 1115, on account of the hideous moral depravity of the clergy and church authorities, and commenced his career as itinerant preacher. His first denunciations were uttered at Lausanne; thence he betook himself to France, following in the steps of Peter of Bruys. His character soon made itself felt; his eloquence attracted the people, and no denunciations from the ecclesiastical authorities had any effect in restraining him. At last, Hildebert, bishop of Le Mans, expelled him from his diocese as an agitator, and we next find him in Provence; but in 1134 he was arrested as a dangerous stirrer-up of the people, and condemned by the council of Pisa to imprisonment, which, however, was not of long duration. The last years of his life were spent at Toulouse, where pope Eugenius thought it necessary to take active measures for the defense of his church, and Henry was condemned to prison, and died in obscurity there about the year 1148. His followers were dispersed.

HENRY, CALEB SPRAGUE, D.D., b. Mass., 1804; graduated at Dartmouth, and studied theology at Andover. In 1828 he became Congregational minister at Greenfield, Mass., and in 1833 removed to Hartford, Conn. About 1834 he started *The American Advocate of Peace*, the organ of the peace society. In New York, in 1835, he was pastor of a Protestant Episcopal church, and subsequently professor of moral and intellectual philosophy in Bristol college. In 1837, with the aid of rev. Francis L. Hawks, he established the *New York Review*. Two years later he was professor of history and philosophy in the New York university. Among his numerous works are *Compendium of Christian Antiquities; Moral and Philosophical Essays; Household Liturgy;* and several translations from the French.

HENRY, JOSEPH, LL.D., 1797–1878; b. N. Y.; educated in Albany academy, where he was professor of mathematics in 1826. His attention was turned to electrical experiments, and he published in 1828 results of modifications in the appliance of electro-magnetism which attracted wide attention, particularly in the application of magnetic force at long distances. About this time he invented a machine worked by magnetism, in which he showed that an oscillating iron bar inclosed in insulated copper wire which was automatic in action would oscillate as long as the magnetic force was applied. He demonstrated the remarkable power that might be produced by a small galvanic apparatus, exhibiting in 1829 electro-magnets which possessed a far greater power than any before tried. One such, occupying only a cubic foot of battery space, is capable of supporting 3,500 lbs. In 1831 was successful in an attempt to make a bell ring at the end of a mile of wire. In the same year he published his observations, and claimed to be the originator of the idea that communication with distant places might be made feasible by magnetism, some years before Morse reduced the matter to practice. In 1832 he became professor of natural philosophy in Princeton college. There and in Europe he pursued his investigations and experiments, and made the acquaintance of distinguished scientists. On the establishment of the Smithsonian institution (1834), he was selected as secretary and chief director, holding the position through life. In 1849 he was chosen president of the American association for the advancement of science, and in 1868 he was president of the National academy of sciences. In 1871 he was head of the lighthouse board, in which capacity he introduced valuable improvements in the service. Among his publications are *Contributions to Electricity and Magnetism*, and a great number of papers in the scientific journals, and the reports of the Smithsonian institution. Among his chief contributions to science are the electro-magnet (indispensable to telegraphy), improvements in fog-signals and in coast lights. His observations were also of great service in the lately established signal service. He spent his life in scientific research, without thought of pecuniary profit for himself.

HENRY, MATTHEW, an eminent nonconformist divine, the second son of Philip Henry, one of the 2,000 ministers who left the church of England on the passing of the "act of uniformity," was born at Broad Oak farmhouse, in Flintshire, Oct. 18, 1662. Having qualified himself for the ministry, he began to preach in June, 1686, and in 1687 was settled as pastor of a congregation of dissenters at Chester, where he continued for 25 years. In May, 1712, he removed to a charge at Hackney, near London, having refused two previous invitations from the same congregation. He died of apoplexy, June 22, 1714, while on his return from a visit to his old friends at Chester. He was twice married, and had a large family by his second wife. His principal work is an *Exposition of the Old and New Testament*, in 5 vols. folio, 1710, which was commenced in Nov., 1704, and has been often reprinted. He lived to finish only the Acts of the Apostles. The remainder was completed by various ministers, whose names are given in some of the editions. His first publication, entitled *A Discourse concerning the Nature of Schism*, 34 pages duodecimo, appeared anonymously in 1689. He was also the author of a biographical sketch of his father, 1696; *A Scripture Catechism*, 1702, 8vo; *Communicant's Companion*, 1704, 8vo; *Discourses against Vice and Immorality*, 1705; *A*

Method of Prayer, 1710, 8vo; *Family Hymns;* numerous sermons; and some religious tracts. His miscellaneous works were republished at London in 1830, 8vo.

HENRY, PATRICK, an eminent American orator, was b. in Hanover co., Va., in 1736. His father was a native of Scotland, and a nephew of Robertson, the celebrated historian. In early life, Henry was passionately addicted to angling and hunting, and seemed too indolent to apply himself to any regular occupation. He managed, however, to pick up a good deal of general information, and he seemed to possess by intuition a profound knowledge of human nature in all its various phases. Having failed successively in "store-keeping" and in farming, he at length was induced to try the profession of law. For a few years this seemed to promise no better success than his former occupations had done, but having been employed in 1755 to plead the cause of the people against an unpopular tax, his peculiar talent seemed suddenly to develop itself; his eloquence, untaught except by the inspiration of native genius, thrilled the audience, and held it in rapt attention more than two hours. From that moment to the present day he has been universally regarded as the greatest of American orators. He was a zealous patriot in the war of the revolution, and was one of the most prominent and influential members of the Virginia legislature, when that state was deliberating whether or not to join Massachusetts in forcibly resisting the arbitrary policy of the home-government. Henry was a delegate to the first general congress, which met at Philadelphia in Sept., 1774, and his voice was the first to break the silence of that assembly. His eloquence on that occasion is said to have astonished all his hearers. In 1776 he was elected governor of Virginia, and was afterwards twice re-elected. In 1795 Washington appointed him secretary of state. He died in 1799.

HENRY, PATRICK (*ante*), 1736-99; was a native of Virginia, and the son of a Scotch emigrant. He was so little promising a scholar, that his father was ready to give up his education in despair, but when he was 14 years old he was so impressed with the fervid eloquence of Samuel Davis, a celebrated Presbyterian preacher, that the fire of oratory kindled in his heart. In his business life Patrick was careless and even shiftless, and seldom successful in his undertakings. He was slovenly in dress, and showed no aptitude for business of any kind. Scraping a violin, torturing a flute, following the hounds and relating anecdotes, constituted his ambition. At the time that he married the daughter of a farmer, a Miss Shelton, his business collapsed and he became wretchedly poor. He next tried farming, but had neither the perseverance nor the knowledge that insure success, and after one more of many failures he opened a store, and succeeded in failing sooner than in his earlier ventures. When no customers appeared he would close his store and go fishing. But in his more sensible intervals he studied such books as he could find, and managed to gain a fair idea of the Latin and Greek authors. Having utterly failed in farming and in trade, he made an attempt at the law, and after only a month and a half's study, had the boldness to ask for license to practice. This was granted on the condition that he should extend his studies before undertaking to practice. Practice was not easy to obtain, and the necessities of his family increased. In fact they were supported by his wife's father, who kept a small tavern at Hanover Court-House, Patrick now and then assisting in the duties of the house. But suddenly (in 1763) one of those strokes of fortune that develop intellectual giants overtook him, and he was engaged in the place of a more experienced advocate who refused to undertake the defense in a case, now forgotten, but long known as the "cause of the parsons," of which the main points were as follows: In those days in Virginia the priests or clergy were paid to a great extent in produce, and among their annual receipts were entitled to 16,000 lbs. of tobacco. In 1755 a severe drought occurred, which, following the French-Indian war, greatly reduced the means of the people. On this account the colonial legislature provided that all debts due in tobacco might be paid in money at 16s. 8d. (English money) per 100 pounds. This reduced the income of the ministers about two thirds. A similar law passed in 1758 gave rise to a bitter controversy between the planters and the ministers. The clergy appealed to the king, and the oppressive act was declared void. This brought down upon the clergy almost universal denunciation, the more so because in many instances they had sued for the losses suffered under the illegal act. A test case was heard in Hanover county, and the court decided in favor of the ministers. The trial was crowded, more than 20 of the clergy being on the bench, Patrick's father acting as presiding justice, while a distinguished lawyer stated the case for the plaintiffs. Patrick, upon rising to speak for the other side, commenced a rambling and uninteresting address. The clergy smiled in anticipative triumph, but suddenly his diffidence passed away, a strange change came over him; as a contemporary says, "a mysterious and almost supernatural transformation of appearance:" his form expanded, and the force of his speech "made their blood run cold and their hair rise on end." The ministers left their bench under his withering invective; the jury without hesitation gave a nominal verdict of one penny damages. The excitement was so intense that the audience seized the young orator and bore him in triumph on their shoulders, and thus, at one bound, Patrick Henry rose to the front rank of American orators. There was no lack of clients thereafter, and his prosperity was assured. But he was not satisfied with his legal profession. In 1765 he became a member of the house of burgesses. At the criti-

cal period of the stamp act debate, Henry was comparatively unknown to the assembly, and the rich planters were scandalized at his presumption in offering to address the house upon so important a subject. Henry hastily wrote brief resolutions which set forth that the burgesses and the governor had the exclusive right and power to lay taxes and imposts upon the people of this colony, and that not alone the stamp act, but all acts of parliament affecting the rights of the colonies were unconstitutional and therefore void. A storm of opposition followed; the resolutions were denounced as extreme, impolitic, and dangerous. Henry writes: "Many threats were uttered, and much abuse was cast on me by those who wished submission." Thomas Jefferson attested that "the debate was most bloody." But Henry would not yield. In the debate he startled even the patriots by exclaiming: "Cæsar had his Brutus, Charles the first his Cromwell, and George the third"—here he was interrupted by the presiding officer and members with cries of "Treason! treason!"—"may profit by their example," calmly said the orator, completing the sentence, adding, "If this be treason, make the most of it." The resolutions were adopted by a majority of one. He was now a power in the colony, and replaced the vacillating planters in the leadership. He became the authorized representative of the people against the aristocracy. He rose to higher public duties when the stamp act was repealed, other burdens were laid upon the colonies in the form of duties upon tea and other necessary articles. The opposition to such imposts shown by Henry, Jefferson, and the Lees, brought about the dissolution of the house of burgesses by lord Botetourt, the royal governor. Henry was the leader in preparing the articles of an association to discourage the use of British merchandise. He continued his legal business, and, though wanting in legal education, was wonderfully successful before juries. With Jefferson and others he was ready to precipitate an open rupture with England. In 1773, Henry, Jefferson, Dabney Carr, and the two Lees, originated the committee of correspondence, whose duty it was to spread intelligence among the colonies. Dunmore was then governor, and he at once dissolved the burgesses, who were at once re-elected by the people, and early in 1774 they met again. In Boston the tea had been thrown into the sea, and a collision was to be expected at any moment. The burgesses appointed a day of fasting and prayer, and for this Dunmore again dissolved the body. Then the burgesses convoked an assembly to be chosen by the people, to meet at Williamsburg, Aug. 1, 1774. That body adopted a non-importation agreement, and appointed delegates to a congress to meet at Philadelphia. Henry was one of the delegates, and in that famous assembly he was hailed as the champion of constitutional liberty, and his wonderful eloquence was at once recognized. The main result of the congress was to send a petition to the king, and an address to the people of the mother country. In Mar., 1775, a convention met at Richmond, of which Henry was the moving spirit. His resolutions to organize the militia and put the colony in an attitude of defense met with great opposition. He replied in a burning speech in which occur the memorable words: "There is no retreat but in submission and slavery. Our chains are already forged. Their clanking may be heard in the plains of Boston. The next gale that sweeps from the north will bring the clash of resounding arms. I know not what course others may take, but, as for me, give me liberty or give me death!" Without an opposing voice the resolutions were adopted, and very soon afterwards came the news of the battle at Lexington and Concord. Virginia was ripe for revolt. Dunmore knew this, and privately took away all the powder in the colony. The people took up arms; they were told that the powder would be returned, and 700 men at once disbanded. Henry seized the favorable moment, gathered a force of militia, and marched upon Williamsburg to arrest the royal receiver-general. An agent of Dunmore's met him, and paid him £330 for the powder. Henry was denounced for stirring up sedition, but it was too late to talk of loyalty; the province was aroused, and in June Dunmore took refuge on a man-of-war. A convention assembled at Richmond and appointed a committee of public safety with most extensive powers. Two regiments were raised, and Henry was appointed commander of all the forces to be raised. The first collision was at Great Bridge, where the Virginia militia gained a triumph over drilled British troops, and drove Dunmore back to his ship. Henry should naturally have been the leader of the troops, but the active command was given to col. William Woodford. Henry was disappointed, and resigned. In the convention of May, 1776, when the delegates to the Philadelphia congress were instructed to demand the independence of the colonies, he took an active part. In that year he was chosen governor of Virginia, and was re-elected until 1779, when he was not legally eligible. He returned to the legislature in which he served through the war, and was then once more chosen governor, serving until 1786, when he finally resigned. In 1788 he was a member of the convention to ratify the federal constitution, which he vigorously opposed, chiefly on the ground that it would tend to supersede state rights. In 1795 Washington offered him the position of secretary of state, but he declined. He also declined Adams's offer of the French mission, and a nomination as governor in 1796. He was elected to the state senate in 1799, but did not live to take his seat, dying June 6 of that year.

HENRY, PHILIP, 1631–96; b. London; educated at Westminster and ordained in 1657. He was one of the clergymen who left the English church in 1662 in consequence

of the act of uniformity. For 25 years he maintained silence, but in 1697 was permitted to preach after the king's declaration of liberty of conscience, and occupied the pulpit until his death.

HENRY, ROBERT, D.D., a Scotch historian and divine, was b. at St. Ninians, in Stirlingshire, Feb. 18, 1718. He studied at the university of Edinburgh; and from 1768 till his death in 1790, was one of the ministers of the established church in that city. His *History of Great Britain on a New Plan*—the first volume of which was published in 1771, and the sixth in 1793, after his death—is a respectable performance, and the "new plan" on which it professes to be written—viz., that of embracing the social aspects of successive periods, and thus tracing the progress of civilization in Great Britian—was unquestionably an improvement on anything that had been done before; but the work has no pretensions to critical acumen or even strict accuracy, and consequently is now of little value.

HENRY, WILLIAM, F.R.S., an eminent chemist, was b. in 1774 in Manchester, and d. in 1836 at Pendlebury near that city. After studying medicine in the Manchester infirmary, under the guidance of Drs Percival and Ferriar, Henry attended the lectures of Black, Gregory, etc., in Edinburgh, in the session of 1795–96. After an interval of several years, in which he was chiefly engaged in superintending a chemical business which had been established by his father, he returned to Edinburgh in 1805, and received the degree of doctor of medicine from that university in 1807. From that time till shortly before his death, he devoted himself to the allied subjects of chemistry and medicine. He was the author of nine papers in the *Philosophical Transactions* (chiefly on the chemistry of the gases); and his *Elements of Experimental Chemistry,* in two volumes, which was published in 1799, reached an eleventh edition in 1829, an almost unparalleled success for a purely scientific work. Henry, like Dr. Wollaston, make the results of science, obtained by the most original and difficult researches, the foundation of a splendid fortune, and few persons have contributed more effectually by the application of their discoveries to the promotion of the arts and manufactures. The memoires of the Manchester society are chiefly indebted to him and to Dalton for their high scientific character.

HENRYSON, ROBERT, 1425–1506; an early Scottish poet and author of the first specimen of the pastoral poetry of his country; according to tradition the ancestor of the family of Henryson or Henderson of Fordell, in the county of Fife, one of whom, James Henderson, was king's advocate and justice-clerk in 1494. From various circumstances known about him he must have been born about the year 1425. He seems to have been educated abroad, as his name does not appear in the registers of the university of St. Andrews, the only one then existing in Scotland; and from an allusion in one of his poems, his attention was probably given to the study of law. In 1462 his name appears in the list of members of the newly founded university of Glasgow as "Magister Robertus Henrysone in artibus licentiatus et in decretis Bachalarius." Henryson seems, in addition to teaching, to have practiced at Dunfermline, as a notary public. His decease in or shortly before 1506 is alluded to by Dunbar. Of the writings of Henryson that have come down to the present time his *Testament of Creseide* may be considered the chief. It was composed as a continuation or supplement to Chaucer's *Troilus and Creseide* which was one of the most popular poems in the English language. Henryson resumes the story where Chaucer leaves off, and completes it by inflicting a suitable punishment on the false Creseide. This continuation displays so much skill that it has been included in all the early editions of Chaucer, as if it had been the work of that poet himself. Another poem, *Robene and Makyne,* though short, is remarkable as the first known specimen of pastoral poetry in the Scottish language, while his *Bludy Serk,* is amongst the oldest examples of ballad poetry. His metrical version of 13 of the *Fables of Æsop,* is perhaps the best known of his works. To each fable is appended an application or moral. In these he alludes to the oppressions of the people and the unsettled state of the country during the feeble reign of James III.

HENSHAW, JOHN PRENTISS KEWLEY, D.D.; 1792–1852; b. Conn., and graduated at Middlebury (Vt.) college in 1808. From a Congregationalist he became an Episcopalian, preached a number of years in Brooklyn, N. Y., and went to Baltimore in 1817, where he was 26 years rector of St. Peter's church. In 1843 he was bishop of Rhode Island. Among his works are *Theology for the People, Inquiry Concerning the Second Advent,* and *Lectures on Terms used in the Prayer Book.*

HENSLER, ELISE, b. Switzerland, 1835. At five years of age the family removed to the United States, and became residents of Boston. The child early showed considerable talent as a vocalist, and was sent, when about 15 years old to Milan to study, through the liberality of certain citizens of Boston. She made her *début* in *La Scala* in 1854, with success, and in 1855 supported Mme. La Grange at the academy of music in New York, where she became a favorite. She continued to sing in this country and in Europe, until, in 1868, having attracted the attention of Dom Fernando, ex-king of Portugal, they were married June 10, 1869, Miss Hensler receiving the title countess d'Edla, under which she was espoused.

HENTZ, CAROLINE LEE, 1800–56; b. Mass., maiden name Whiting; married 1825 N. M. Hentz, who became a professor in Chapel Hill college, N. C. She afterwards removed to Kentucky, where she became known as a writer. Her first publication was *De Lara or the Moorish Bride*, a play, for which she received a prize. Her life was passed in several of the southern states. Among her books are nearly a dozen stories which were very popular. Perhaps the best known was *The Mob Cap*.

HE'PAR (Gr. *hepar*, the liver), is the name given by the older chemists to various compounds of sulphur, from their brown, liver-like color; of these, *hepar sulphuris*, which is in reality a mixture of tersulphide of potassium and some oxysalts of potash, is the best known.—HEPATIC, belonging to the liver; as, *hepatic* artery, vein, duct, etc. —HEPATICA. This term has been given by writers on *materia medica* to medicines which effect the liver and its appendages. The hepatica may be employed (1) to modify the secretion of bile; (2) to remove pain of the liver or gall-bladder, or pain and spasm of the gall-ducts; or (3) to relieve enlargement and other affections of the liver.

HEPA'TICÆ, or LIVERWORTS, a natural order of cryptogamous plants, included among mosses by the older botanists. They have generally a leafy stem; more rarely they are expanded into a leaf-like form. The reproductive organs are of two kinds, *antheridia* and *pistillidia*, as in mosses; the spore-cases (capsules, matured pistillidia) have no operculum: open when ripe by 4—8 valves, more rarely by teeth; and generally contain, along with the spores, spiral filaments called *elaters*. Each elater consists of two spiral fibers, which, whilst the spore case is unbroken, remain coiled up together within an oval cell; but when, by the breaking of the mature spore-case, the outer pressure is removed, their elasticity bursts their cells, and as they suddenly extend themselves, they aid in the dispersion of the spores. The hepaticæ are found in situations generally similar to those of mosses, and are widely distributed over the globe; but the greater number belong to warm climates, where they often grow on the bark, and even on the leaves of trees. Some botanists divide hepaticæ into three orders, *Jangermanniaceæ*, *Marchantiaceæ*, and *Ricciaceæ*.

HEPATI'TIS (Gr. *hepar*, the liver), inflammation of the liver. Hepatitis is a rare disease in temperate latitudes, and in tropical climates is often so acute and so rapidly fatal as to admit but little of medical treatment. It is indicated by pain in the right side and shoulder, tenderness on pressure in the right hypochondrium (see ABDOMEN), with enlargement of the liver as detected by the hand and by percussion, often vomiting, always fever, with more or less loss of appetite and a foul tongue. Not unfrequently there is jaundice (q.v.). The disease sometimes ends in abscesses, which may require to be opened externally. The treatment is complicated, and cannot be ventured upon without professional assistance. The other diseases of the liver will be treated of under LIVER, DISEASES OF.

HEPHÆSTION, son of Amyntor, a Macedonian of Pella and friend of Alexander the great. The two were companions in childhood, but beyond this connection we find no evidence of such qualities in Hephæstion as deserved the passionate attachment of Alexander. The king seems never to have been blind to his real character, and to have made a marked distinction between him, as the friend of his private life and his leisure hours, and such men as Craterus whom he could intrust with important enterprises. We do not hear of Hephæstion till 334 B.C., when he accompanied the king on his visit to Troy. Many tales are told of the close intimacy existing between them; for example, when a letter of very delicate and private nature from Olympias was handed Alexander, Hephæstion according to his custom was reading it over his shoulder, when Alexander without uttering a word took his ring off his finger and pressed it on his friend's lips. In the later campaigns of Alexander in Bactria and India, we find Hephæstion charged with important commands. He was rewarded with a golden crown and the hand of Drypetis, the daughter of Darius and sister of Alexander's own wife Statira (324 B.C.). In the end of the same year he died very suddenly at Ecbatana. Alexander tried to relieve his grief by paying the most extravagant honors to his friend. A general mourning was ordered over Asia; at Babylon a funeral pile was erected at a cost of 10,000 talents; and temples were erected to him as a hero.

HEPHÆS'TUS. See VULCAN.

HEP'TAGON, a plane figure of *seven* sides and *seven* angles; when the sides and angles are equal, the figure is a *regular heptagon*. Geometers have hitherto failed to discover a method of inscribing the heptagon in, or of circumscribing it about a circle, and the problem is believed by many to be, like "the trisection of an angle," impossible of solution by the ancient geometry.

HEPTANOMIS, a name given by the Greeks to the interior of Egypt from 30° to 27° n., which comprised nearly all the greatest Egyptian cities and monuments.

HEP'TARCHY, THE, is the name given to seven kingdoms said to have been established by the Saxons in England. See ANGLO SAXONS. The common idea is, that these seven kingdoms were contemporaneous; but all that can be safely asserted is, that England, in the time of the Saxons, was peopled by various tribes, of which the leading occupation was war; and that sometimes one was conquered, sometimes another. At no time was there a counterpoise of power among seven of them, so that they could be

said to have a separate, much less an independent existence. Still, seven names do survive (some authorities adding an eighth). The king of the one that had the fortune to be most powerful for the time being, was styled Bretwalda or ruler of Britain, but in most instances the power of this supposed ruler beyond the limits of his own territory must have been very small. Under Egbert, Wessex rose to be supreme, and virtually swallowed up the others. The following is a brief account of the seven kingdoms commonly said to have formed the heptarchy:

1. Kent, after the battle of Creccanford, in which 4,000 Britons were slain, was abandoned by the Britons, and became the kingdom of their conquerors, a band of Jutes, who had come in 446 A.D. to serve Vortigern, king of the Picts, as mercenaries, under the leadership of Hengist and Horsa, who were little other than pirates. Hengist became king of Kent, and his son Eric or Aesc succeeded him, and from his descendants, the kings of Kent, were called Aescingas. In 796 Kent was conquered by Cenwulf, king of Mercia; and about 823 both were conquered by Egbert, king of Wessex, who appointed his son Ethelwulf king of Kent, which hereafter, though separate in name, was really subordinate to Wessex.

2. Sussex, partially conquered about 477, and wholly, before 491, by Ella the Saxon, who was the first bretwalda of Britain. Sussex submitted to Egbert of Wessex in 828, and his son Athelstane governed it under him.

3. Wessex, though fluctuating in extent, as all the kingdoms did, included Surrey, Hants, the Isle of Wight, Berks, Wilts, Dorset, Somerset, Devon, and part of Cornwall. It was founded about 494 by Cerdic and Cynric his son, "Ealdormen" or leaders of the "old Saxons." King Egbert, who returned from a flight to Gaul in 800, and ruled from that year till his death in 836, was, as a conqueror, the most successful of all these Saxon kings. When he died, his dominions were divided between his sons, Ethelwulf and Athelstane, the former taking Wessex Proper, and the latter Kent, Essex, Sussex, and Surrey. Another Athelstane, who succeeded in 925 to Mercia and Wessex, conquered Exeter, and assumed Northumbria, exacted tribute from the Welsh, and some formal submission from the Britons of the west, as well as the Danes and Scots. He appears occasionally to have held witenagemôtes or Saxon parliaments of subordinate chiefs (*subreguli*), and at one of these, Constantine, king of Scotland, appeared as a *subregulus*. But Athelstane and his successors, as well as his predecessor, Alfred the great, belong to the history of England, as indeed do all the Saxon states and kings after Egbert.

4. Essex, which comprised also Middlesex, if ever independent, was so about 530 A.D.; but early in the 7th c. it became subject to Mercia, and fell with it to Wessex in 823. This state and Sussex and Wessex were founded by the old Saxons; the remaining three by the Angles who came from Holstein, and gave their name to England.

5. Northumbria consisted of Bernicia and Deira, which were at first separate and independent states. The former comprised Northumberland and all Scotland s. of the Forth, and was founded by Ida about 560. The latter comprised Cumberland, Durham, York, and Lancaster, and was founded by Ella the Angle about the same date. These two were united about 655, and as Northumbria, they submitted to Egbert in 829.

6. East Anglia, comprising Norfolk, Suffolk, and Cambridge, was founded about 571 by Uffa, and from him its kings were named Uffingas. In 883 it was conquered by the Danes, and was only restored to Saxon rule by Athelstane in 925.

7. Mercia included the counties in the center of the kingdom, and is said to have been founded by Crida or Creoda in 585. Three-quarters of a century later it was conquered for a time by Northumbria, but it recovered its independence, and retained it until Egbert subdued it. Canute the Dane had it and Northumbria ceded to him in 1016, just before Edmund Ironside's death allowed him to become king of England, and the Danes to obtain the ascendency over the Saxons, for which they had been striving, at intervals, for five generations. Compare Palgrave's *Rise and Progress of the English Commonwealth* (2 vols. Lond. 1832).

HEPWORTH, GEORGE HUGHES, b. Boston, 1833; graduated at Harvard theological school, and became a Unitarian preacher in Nantucket. In 1858 he was pastor of a Boston church; in 1862 chaplain of the union army; 1863 on gen. Banks's staff in Louisiana. After the war (1870) he took charge of the church of the Messiah in New York, but resigned within two years, renouncing the Unitarian faith, and soon afterwards he established in the same city the Congregational church of the Disciples. He resigned this charge in 1878, and went abroad for rest, and to recruit his wasted health. He has been distinguished as a popular lecturer, and is the author of some published volumes, among which are *Whip, Hoe, and Sword*, and *Rocks and Shoals*.

HERA. See JUNO.

HERACLEA, a city of Bythinia (now Eregli in Amadolia) on the s. coast of the Black sea, having a good harbor and considerable trade. In the time of Alexander the great it rose to great prosperity, but in the Roman war against Mithridates it was nearly destroyed. (See Eregli.)

HERACLEA, a city of Sicily, at the mouth of the Halycus (the modern Platani), not far from the promontory now known as cape Bianco. It is distinguished from other Heracleas by the surname of Minoa, which is explained as referring to its founda-

tion by Minos of Crete. Its name frequently occurs in connection with the Carthaginian occupation of Sicily, and it was in the neighboring sea that the Carthaginian fleet was routed by Regulus and Manlius, 256 B.C. The Romans introduced a colony.

HERACLEI'A, an ancient city of Magna Græcia, situated on the right bank of the Aciris (the modern Agri), about 3 m. above the mouth of that river in the gulf of Tarentum. It was founded about 432 B.C., and although under the Romans it became a prosperous, important, and refined city, it never acquired any historical prominence. When it fell into decay is not known, but at the present day little more remains to mark its site than heaps of rubbish. In the neighborhood, besides a large number of coins, ranking among the very finest relics of antiquity, there have been discovered certain bronze tables, known as the *Tabulæ Heracleenses* containing a copy of the *Lex Julia Municipalis* (45 B.C.), and forming one of the principal authorities for a knowledge of the municipal law of ancient Italy. This inscription has been published by Muratori, Savigny, and others.

HERACLEI'DÆ. This term means, in its widest sense, all "the descendants of Heracles" (Hercules), of whatever time, and in whatever district of Greece, but is specially applied to those adventurers who, founding their claims on their supposed descent from the great hero (to whom Zeus had promised a portion of the land), joined the Dorians in the conquest of the Peloponnesus. There were five different expeditions, the last and greatest occurring eighty years after the Trojan war. The leaders of this last were Temenus, Cresphontes, and Aristodemus, sons of Aristomachus. They defeated Tisamenus, son of Orestes, and grandson of Agamemnon, and thus gained possession of Argos, Sparta, and Mycenæ. The other parts of the country quickly submitted to them, and they then proceeded to divide the spoil. Argos fell to Temenus; Lacedæmon to Procles and Eurystheus, the sons of Aristodemus; and Messenia to Cresphontes. This story of the return of the Heraclidæ touches on the historical period, and though there is much of fable and tradition, yet there seems to be also a large substratum of truth in the records.—See Müller's *Dorians*, Thirlwall's and Grote's *Greece*.

HERACLEI'TUS, a Greek philosopher, was b. at Ephesus, in Asia Minor, and flourished about 500 B.C. He is said to have traveled much, and to have been very sorrowfully impressed with the weaknesses of his fellow creatures, whence, according to old traditions, he obtained the nick-name of the "weeping philosopher," in contrast to Democritus, "the laughing philosopher." He died at the age of 60. The result of Heracleitus's researches and meditations was a work on the nature of things, said to have been entitled *Peri Physeōs* (on nature). Such fragments of it as remain were collected and elucidated by Schleiermacher in Wolf and Buttmann's *Museum der Alterthumswissenschaften* (vol. i. part 3, Berlin, 1805). From these, it appears that he considered fire to be the first principle of all phenomena, and the original substance out of which they have all been evolved. Heracleitus was neither a very original nor a very coherent thinker, and his speculations deserve little attention.

HERACLEONITES, called after Heracleon, a Gnostic who flourished 125 A.D. in S. Italy or Sicily. In his system he appears to have regarded the divine nature as a vast abyss in whose *pleroma* were æons of different orders and degrees,—emanations from the source of being. Midway between the supreme God and the material world was Demiurgus, who created the latter, and under whose jurisdiction the lower animal soul of man proceeded after death, while his higher celestial soul returned to the pleroma whence it first issued. Heracleon seems to have received the ordinary Christian scriptures; and Origen has preserved fragments of a commentary by him on St. John's gospel, while Clement of Alexandria quotes from him what appears to be a passage from a commentary on St. Luke's gospel. These writings are remarkable for their intensely mystical and allegorical interpretations of the text.

HERACLES. See HERCULES, *ante*.

HERACLIDES, PONTICUS, a Greek author of the 4th c. B.C., said to have been a disciple of Plato and Aristotle. According to Suidas, the second of these philosophers, on departing for Sicily left his scholars in the charge of Heraclides. The latter part of his life was spent at Heraclea. He is said to have been vain and fat, and to have maintained such state in Athens that the wits changed his name into Pompicus, or the Showy. On one occasion Heraclea was afflicted with famine, and the pythoness at Delphi, bribed by Heraclides, assured his inquiring townsmen that the dearth would be stayed if they granted a crown to that philosopher. This was done; but just as Heraclides was receiving his honor in a crowded assembly he was seized with apoplexy, while the dishonest priestess perished from the bite of a serpent. On his death-bed he is said to have requested a friend to hide his body as soon as life was extinct, and, by putting a serpent in its place, induce his townsmen to suppose that he had been carried up to heaven. The trick was discovered, and Heraclides received only ridicule instead of divine honors.

HERAC'LIUS, a Byzantine emperor (610–641), of splendid but fitful genius, was descended from a line of brave ancestors, and was b. in Cappadocia about 575 A.D. His father, also named Heraclius, was exarch or gov.gen. of Africa. Regarding Heraclius's youth we know almost nothing; but when upwards of 30, he took part in a conspiracy (which proved successful) against the emperor Phocas, whose horrible cruelties

had made him universally detested. In 610 Heraclius, at the head of a fleet, appeared at Constantinople: the citizens rose in rebellion, Phocas was beheaded, and Heraclius saluted emperor in his stead. His fellow-conspirators were richly rewarded. The condition of the Byzantine empire at this time was deplorable. Factions within and the barbarians without had almost reduced it to ruin, so that years elapsed before Heraclius could put forth any vigorous efforts for its reorganization. His most powerful enemies in the north were the Avari, who, in 619, plundered the country to the very gates of Constantinople, nearly captured Heraclius himself, and are said to have carried with them to their homes beyond the Danube 250,000 prisoners. The whole western empire had by this time been seized by the Slaves, Lombards, Visigoths, and other tribes; but by far the most alarming conquests were those made in the east by the Persian king, Chosroës II. In 615 Sarbar, the Persian general, stormed and plundered Jerusalem. The same fate befell Alexandria in the following year, after which all Egypt yielded to the victorious Sarbar, who penetrated as far as Abyssinia. By stopping the export of corn from Egypt to Constantinople, he likewise caused a severe famine in the latter city. In the same year (616) the Persians besieged and captured Chalcedon, opposite Constantinople. Heraclius at first tried to negotiate with his enemies, but, flushed with their triumphs, they refused, and even put his ambassadors to death. Probably the emperor, who was now laying his plans for taking a magnificent revenge on the Persians, was not greatly displeased at their refusal. Having, after a whole year of laborious discipline, organized an army composed of Greeks and barbarians, he, in 622, shipped his troops at the Bosporus, and sailed for Cilicia. Having landed, he encamped in the plain of Issus, completely routed a Persian army dispatched against him, and forced his way through the passes of the Taurus and Anti-Taurus, into the province of Pontus, where his soldiers wintered. In 624 he crossed Armenia, conquered several of the Perso-Caucasian countries, and reached the Caspian sea. Here he formed an alliance with the khan of the Khazars, who ruled over the sterile regions north of the Caucasus, as far as the river Ural. By the assistance of these and other barbarians, he attacked Media, and carried his arms as far south as Ispahan. Before going into winter quarters, he again utterly defeated the main body of the Persians, commanded by Chosroës himself. In 625 Heraclius descended from the Caucasus into Mesopotamia, and thence proceeded into Cilicia, where a sanguinary engagement took place between him and Sarbar; the Persians were routed with immense slaughter, and Sarbar fled to Persia. During the next two years (626–628) the glory of Heraclius culminated. He carried the war into the heart of the Persian empire, and in Dec., 627, cut to pieces the forces of Rhazates, the Persian general, near the junction of the Little Zab and the Tigris. An immense booty fell into the hands of the victors. A few days after, Heraclius took Artemita or Dastagerd, the favorite residence of Chosroës, and here the Arabic historians exhaust hyperbole in attempting to state the enormous treasure which the Byzantine emperor captured. Chosroës fled into the interior of Persia, and was soon afterwards seized, imprisoned, and starved to death by orders of his son and successor, Siroes, who was glad to conclude a peace with Heraclius, by which the Persians gave up all their former conquests. The fame of Heraclius now spread over the whole world, and ambassadors came to him from the remotest kingdoms of the east and west; but a new and terrible enemy suddenly arose in the south. The Arabs, filled with the ardor of a new and fierce faith, had just set out on their career of sanguinary proselytism. The war began during the life of the prophet himself was continued by his successors, Abubekr and Omar. Heraclius no longer commanded the Byzantine forces himself, but wasted his days in his palace at Constantinople, partly in sensual pleasures, and partly in wretched theological disputations. His mighty energies were quite relaxed; and before the close of his life, Syria, Palestine, Mesopotamia, and Egypt were in the hands of the caliphs. He died in 641

HER'ALD (derivation uncertain), an officer whose duty consists in the regulation of armorial bearings, the marshaling of processions, and the superintendence of public ceremonies. In the middle ages heralds were highly honored, and enjoyed important privileges; their functions also included the bearing of messages, whether of courtesy or defiance, between royal or knightly personages; the superintending and registering of trials by battle, tournaments, jousts, and all chivalric exercises; the computation of the slain after battle; and the recording of the valiant acts of the falling or surviving combatants. The office of herald is probably as old as the origin of coat-armor. The principal heraldic officers are designated kings-of-arms or kings-at-arms, and the novitiates or learners are styled pursuivants. Heralds were originally created with much ceremony; they are now appointed by the earl-marshal in England, and by the lyon king-of-arms in Scotland. There are now in England three kings-of-arms, named by their offices Garter, Clarencieux, and Norroy; six heralds—Somerset, Chester, Windsor, Richmond, Lancaster, and York; and four pursuivants, Rouge Dragon, Portcullis, Blue Mantle, and Rouge Croix. There have been at different periods other heralds, whose titles are now laid aside; heralds extraordinary have also sometimes been created, as Edmonson, by the title of Mowbray, in 1764. In Scotland the principal heraldic officer is lyon king-of-arms; and there were till lately six heralds—Snowdoun, Albany, Ross, Rothesay, Marchmont, and Ilay; and six pursuivants—Unicorn, Carrick, Kintyre, Ormond, Dingwall, and Bute. By 30 Vict. c. 17, the permanent number of heralds and

pursuivants in Scotland is reduced to three of each. Ireland has one king-of-arms, Ulster; two heralds, Cork and Dublin; and two pursuivants, of whom the senior bears the title of Athlone, and the other is called the pursuivant of St. Patrick.

The official costume of a herald consists of an embroidered satin tabard or surcoat of the royal arms, and a collar of SS. See KING-AT-ARMS, PURSUIVANT, HERALDS' COLLEGE.

HER'ALDRY is properly the knowledge of the whole multifarious duties devolving on a herald (see HERALD); in the more restricted sense, in which we shall here consider it, it is the science of armorial bearings. After occupying for ages the attention of the learned, and forming an important branch of a princely education, the study of heraldry fell, in later times, into neglect and disrepute, and was abandoned to coach-painters and undertakers, a degradation owing in part to the endless tissue of follies and mystifications that had been interwoven with it. Modern criticism has rescued heraldry from the pedantries and follies of the heralds, and imparted to it a new interest, as a valuable aid to historical investigations.

Though we have instances in remote times of nations and individuals distinguishing themselves by particular emblems or ensigns, nothing that can properly be called armorial bearings existed before the middle of the 12th century. The shields of the French knights in the first crusade presented a plain face of polished metal, nor is there any evidence of heraldic devices having been in use in the second crusade in 1147. But the Anglo-Norman poet Wace, who flourished in the latter part of the 12th c., mentions devices or cognizances as being in use among the Normans, "that no Norman might perish by the hand of another, nor one Frenchman kill another;" and Wace is curiously corroborated by the Bayeux tapestry of the 12th c., where there are figures of animals on the shields of the invaders, while the Saxon shields have only borders or crosses. The rude devices on these shields have nothing approaching to an armorial form or disposition, yet it is probable that systematic heraldry sprang out of them, but it is difficult to say when they assumed that hereditary character which is essential to the idea of armorial bearings. Some sort of armorial insignia were depicted on the shields used in the third crusade, which took place in 1189; and in the same half-century originated the fleurs-de-lis of France and the lions of England. The transmission of arms from father to son seems to have been fully recognized in the 13th c., and in the practice then introduced of embroidering the family insignia on the surcoat worn over the hauberk or coat of mail, originated the expression *coat of arms*. Arms were similarly embroidered on the jupon, cyclas, and tabard, which succeeded the surcoat, a practice which survived till the time of Henry VIII., when the tabard came to be entirely disused except by heralds, who still continue to wear on their tabards the royal arms.

It was by slow degrees that the usage of arms grew up into the systematized form which it assumes in the works of the established writers on heraldry. The principal existing data for tracing its progress are English rolls of arms yet extant of the times of Henry III., Edward I., and Edward III. The earliest formal treatises date no further back than the end of the 14th c., before which time the whole historical part of the subject had been obscured by a tissue of gratuitous fictions, which has misled most subsequent writers up to a very recent period. The professors of the science represent the heraldry of the 10th and 11th centuries as equally sharply defined with that of the 15th and 16th. The arms of William the conqueror and his sons are described with all their differences; arms are ascribed to the Saxon kings of England, to Charlemagne, and even to half-mythical persons and heroes of classical times. It is rather surprising to find this fictitious heraldry understood and systematized early in the 14th century. The arms traditionally considered to be those of Edward the confessor were sculptured in Westminster abbey in the reign of Edward II.

In the infancy of heraldry, every knight assumed what arms he pleased, without consulting sovereign or king-at-arm. Animals, plants, imaginary monsters, things artificial, and objects familiar to pilgrims, were all fixed on; and whenever it was possible, the object chosen was one whose name bore sufficient resemblance in sound to suggest the name or title of the bearer of it. There is reason to believe that early arms were generally *armes parlantes*, though the allusion has in many cases ceased to be intelligible from the old name of the object being forgotten. The charge fixed on was used with great latitude, singly or repeated, or in any way which the bearer chose, or the form of his shield suggested. But as coats of arms became more numerous, confusion often arose from different knights adopting the same symbol; and this confusion was increased by a practice which crept in of sovereigns or feudal chiefs allowing their arms, or part of them, to be borne as a mark of honor by their favorite followers in battle. Hence different coats of arms came in many instances so closely to resemble each other that it was imperative, for distinction's sake, that the fancy of the bearer should be restrained, and regulations laid down regarding the number and position of the charges, and the attitudes of the animals represented. This necessity led, in the course of time, to the systematizing of heraldry, a process which the rolls alluded to show us was going on gradually throughout the 13th and 14th centuries. By the time that heraldry was consolidated into a science, its true origin had been lost sight of, and the credulity and fertility of imagination of the heralds led them to invest the most common charges with mystical meanings, and to trace their original adoption to the desire of commemorating

the adventures or achievements of the founders of the families who bore them. The legends ascribing an origin of this sort to the early armorial bearings have, in nearly all instances where it has been possible to investigate them, turned out to be fabrications. It was only when heraldry began to assume the dignity of a science that augmentations of a commemorative character were granted, one of the earliest known instances being the heart added to the coat of Douglas, in commemoration of the good sir James's pilgrimage with the heart of king Robert. After the science became thoroughly systematized, augmentations and new coats were often granted with a reference to the supposed symbolical meanings of the charges.

In England, the assumption of arms by private persons was first restrained by a proclamation of Henry V., which prohibited every one who had not borne arms at Agincourt to assume them, except in virtue of inheritance or a grant from the crown. To enforce the observance of this rule, heralds' visitations or processions through the counties were instituted, and continued from time to time till the reign of William and Mary. See VISITATIONS, HERALDS'.

Jurisdiction in questions of arms is executed by the heralds' college in England, the lyon court in Scotland, and the college of arms in Ireland. No one within the United Kingdom is entitled to bear arms without a hereditary claim by descent, or a grant from the competent authority; and the wrongful assumption of arms is an act for which the assumer may be subjected to penalties. See HERALDS' COLLEGE and LYON COURT. The use of arms, whether rightfully or wrongfully, subjects the bearer of them to an annual tax. It is illegal to use without authority not only a coat of arms, but even a crest. Any figure or device placed on a heraldic wreath (see WREATH) is considered a crest in questions with the heralds' college or lyon court, as well as in questions with the commissioners of inland revenue. It shows how deeply the passion for outward distinction is implanted in human nature, when we find people in countries such as the United States, where all differences of rank are theoretically repudiated, assuming heraldic devices, each man at his own hand.

Besides individuals, communities and states are entitled to the use of arms, and heralds have classified arms, in respect of the right to bear them, under the following ten heads: 1. Arms of dominion; the arms borne by sovereigns as annexed to their territories. 2. Arms of pretension, which sovereigns have borne, who, though not in possession, claim a right to the territories to which the arms belong. Thus, England bore the arms of France from the time of Edward III. till 1801. 3. Arms of community; the arms of bishops' sees, abbeys, universities, towns, and corporations. 4. Arms of assumption; arms which one has a right to assume with the approbation of the sovereign. Thus, it is said, the arms of a prisoner at war may be borne by his captor, and transmitted by him to his heirs. 5. Arms of patronage; added by governors of provinces, lords of the manor, patrons of benefices, etc., to their family arms, as a token of superiority, right, or jurisdiction. 6. Arms of succession, borne quartered with the family arms by those who inherit fiefs or manors, either by will, entail, or donation. Thus, the dukes of Athole, as having been lords of the Isle of Man, quarter the arms of that island, and the duke of Argyle quarters the arms of the lordship of Lorne. 7. Arms of alliance, taken up by the issue of heiresses, to show their maternal descent. 8. Arms of adoption, borne by a stranger in blood, to fulfill the will of a testator. The last of a family may adopt a stranger to bear his name and arms and possess his estate. Arms of adoption can only be borne with permission of a sovereign or king-at-arms. 9. Arms of concession; augmentations granted by a sovereign of part of his royal arms, as a mark of distinction, a usage which, we have already observed, obtained in the earliest days of heraldry; and hence the prevalence among armorial bearings of the lion, the fleur-de-lis, and the eagle, the bearings of the sovereigns of England and Scotland, of France, and of Germany. 10. Paternal or hereditary arms, transmitted by the first possessor to his descendants.

A coat of arms is composed of charges depicted on an escutcheon representing the old knightly shield. The word escutcheon is derived from the French *écusson*, which signified a shield with armorial bearings, in contradistinction from *écu*, a shield generally. The shields in use in England and France in the 11th and 12th centuries were in shape not unlike a boy's kite, a form which seems to have been borrowed from the Sicilians; but when they became the recipients of armorial bearings, they were gradually flattened and shortened. From the time of Henry III., the escutcheon has been most frequently represented on seals as of something approaching to a triangular form, with the point downwards, the chief exceptions being that the shield of a lady is lozenge-shaped, and of a knight-banneret square. To facilitate description, the surface or field of the escutcheon has been divided into nine points (fig. 1), technically distinguished by the following names: A, the dexter chief point; B, the middle chief; C, the sinister chief; D, the honor or collar point; E, the fess point; F, the nombril or navel point; G, the dexter base point; H, the middle base; and I, the sinister base point. It will be observed that the dexter and sinister sides of the shield are so called from their position in relation not to the eye of the spectator, but of the supposed bearer of the shield.

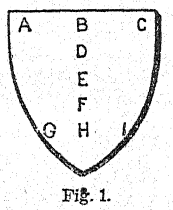

Fig. 1.

Coats of arms are distinguished from one another, not only by the charges or objects borne on them, but by the color of these charges, and of the field on which they are placed. The field may be of one color, or of more than one, divided by a partition line or lines varying in form. The first thing, then, to be mentioned in blazoning a shield —that is, describing it in technical language—is the color, or, as it is heraldically called, *tincture* of the field. Tinctures are either of metal, color strictly so called, or fur. The metals used in heraldry are two—gold, termed *or*, and silver, *argent* —represented in painting by yellow and white. The colors are five—red, blue, black, green, and purple, known as *gules, azure, sable, vert,* and *purpure.* Metals and colors are indicated in uncolored heraldic engravings by points and hatched lines, an invention ascribed to father Silvestro di Petrasancta, an Italian herald of the 17th century. *Or* (fig. 2) is represented by points; for *argent*, the field is left plain. *Gules* is denoted by perpendicular, and *azure*, by horizontal lines; *sable*, by lines perpendicular and horizontal crossing each other; *vert*, by diagonal lines from dexter chief to sinister base; *purpure*, by diagonal lines from sinister chief to dexter base. The *furs* were originally but two, *ermine* and *vair*. The former is represented by black spots resembling those of the fur of the animal called the ermine, on a white ground. *Vair*, said to have been taken from the fur of a squirrel, bluish-gray on the back and white on the belly, is expressed by blue and white shields, or bells in horizontal rows, the bases of the white resting on the bases of the blue. If the vair is of any other colors than white and blue, they must be specified. Various modifications of these furs were afterwards introduced, among others *ermines*, or ermine with the field sable and the spots argent; *erminites*, with a red hair on each side of the black spot; *pean*, with the field sable, and the spots or; *counter-vair*, or vair with the bells of one tincture placed base to base; and *potent counter-potent*, vair with crutch-shaped figures instead of bells.

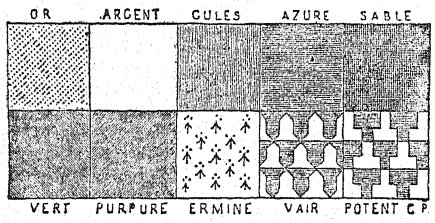

Fig. 2.

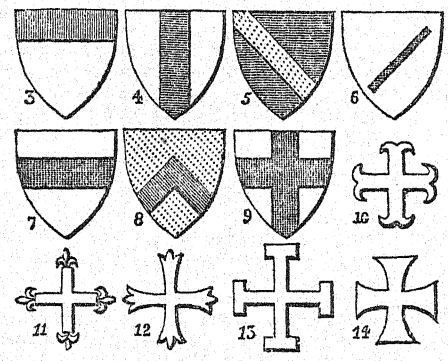
It is an established rule of heraldry that metal should not be placed on metal, nor color on color; a rule more rigidly adhered to in English than in foreign heraldry. We have one remarkable transgression of it in the arms of the kingdom of Jerusalem founded by the crusaders, which are argent, a cross potent between four crosses or. A recognized exception exists wherever a charge lies over a field partly of metal and partly of color, or where an animal is (see *infra*) attired, armed, unguled, crowned, or chained with a tincture different from that of his body. Marks of cadency, chiefs, cantons, and bordures are also occasionally exempted from the general rule, being, according to some heralds, not laid on the shield, but *couru*, or sewed to it.

Everything contained in the field of an escutcheon is called a *charge.* Charges are divided by heralds into the three classes of honorable ordinaries, subordinaries, and common charges. Under the name of ordinaries or *honorable ordinaries* are included certain old and very frequent bearings, whose true peculiarity seems to be that, instead of being taken from extraneous objects, they are representations of the wooden or metal strengthenings of the ancient shields. They are ten in number: 1. The *chief* (fig. 3), the upper part of the shield separated from the rest by a horizontal line, and comprising, according to the requirements of heralds, one-third of it, though this proportion is seldom rigidly adhered to. Its diminutive is the fillet, supposed to take up one-fourth the space of a chief, in whose lowest part it stands.



Figs. 3–14.

2. The *pale* (fig. 4) a band or stripe from top to bottom, said, like the chief, to occupy one-third of the shield. It has two diminutives, the *pallet*, one-half in breadth of the pale, and the *indorse*, one-half of the pallet.

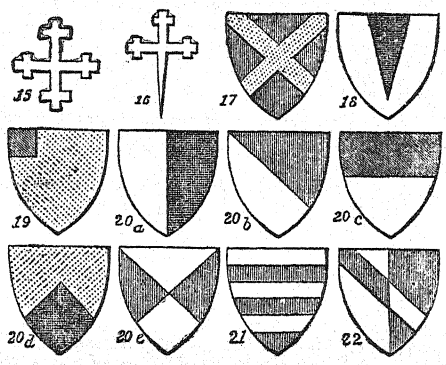
3. The *bend* (fig. 5), a similar band crossing the shield diagonally from dexter chief to sinister base. Its diminutives are the *bendlet* or *garter*, one-half of its breadth; the *cost* or *cotise*, one-half of the bendlet; and the *riband*, one-half of the cotise. The bend is sometimes borne between two cotises, in which case it is said to be *cotised*, a term sometimes applied with doubtful propriety to the other ordinaries when accompanied with their diminutives.

4. The *bend sinister*, a diagonal band from sinister chief to dexter base. Its diminutives are the *scarpe*, one-half of the bend sinister; and the *baton* (fig. 6), one-half of the scarpe. The baton stops short of the extremity of the field at both ends, and has been considered a mark of illegitimacy. See BASTARD BAR.

5. The *fess* (fig. 7), a horizontal band in the middle of the shield, said, like the ordinaries already enumerated, to occupy one-third of it. Its principal diminutive is the *bar*, containing the fifth part of the field; and there are also the *closet*, one-half of the bar, and the *barrulet*, one-half of the closet, the latter seldom borne singly.

6. The *chevron* (fig. 8), composed of two stripes descending from the center of the shield in diagonal directions like the rafters of a roof. Its diminutives are the *chevronel*, of half, and the *couple-close*, one-fourth its width, the latter borne, as its name implies, in pairs, and generally accompanying the chevron—on each side of it.

7. The *cross* (fig. 9), uniting the pale and fess, an ordinary which was originally like the rest, composed of the clamps necessary to the strength of the shield, but had also the deeper meaning of the symbol of the Christian faith. Besides its plain form, the cross was varied in numerous ways, most of these varieties being, however, rather common charges than ordinaries. Of the 39 lesser crosses mentioned by Guillim, and 109 by Edmonson, a few of the most frequently occurring are the following: the *cross moline* (fig. 10), with the ends turned round both ways; the *cross fleury* (fig. 11), of which each limb terminates in a fleur-de-lis; the *cross patonce* (fig. 12), each limb of which has three points; the *cross potent* (fig. 13), crutch-shaped at the ends; the *cross pattée* (fig. 14), small in the center, but widening towards the ends; and the *cross crosslet* (fig. 15), crossed at the ends. The latter is the most frequent of all, and borne oftener in numbers than singly. Any of these crosses is said to be fitchée when the lower limb terminates in a sharp point, as in fig. 16. There is also the *cross Maltese*, whose limbs have each two points, and converge to a point in the center of the cross; though not frequent as a heraldic charge, it derives an importance from being the badge of the knights of Malta and of many other orders.



Figs. 15-22.

8. The *saltire*, or St. Andrew's cross (fig. 17), formed by a junction of the bend dexter and bend sinister.

9. The *pile* (fig. 18), a wedge with the point downwards. A single uncharged pile should, at its upper part, occupy one-third the breadth of the shield, but if charged, it may be double that width.

10. The *quarter*, consisting of the upper right-hand fourth part of the shield cut off by a horizontal and a perpendicular line. Its diminutive is the *canton* (fig. 19).

Armorial figures may be depicted on any of these ordinaries, but not on their diminutives, with the exception of the canton.

We observed that the field of an escutcheon may be of two different tinctures, divided by a partition-line, which line may vary in direction. When divided by a partition-line in the direction of one of the ordinaries, the shield is said to be *party per* that ordinary; thus we may have (figs. 20) a shield party per pale, bend, fess, chevron, or saltire. An escutcheon divided as by a cross is said to be quartered. A shield divided into any number of parts by lines in the direction of a pale, bend, or bar, is said to be *paly, bendy, barry*, the number of pieces being specified, as in the example fig. 21, barry of six, argent and gules. When the field is of a metal and color separated by any of the lines of partition, and the charge placed on it is said to be *counter-changed:* this means that the part of the charge which is on the metal is of the color, and *vice versa*, as in fig. 22, the arms borne by Chaucer the poet, per pale argent and gules, a bend counter-changed.

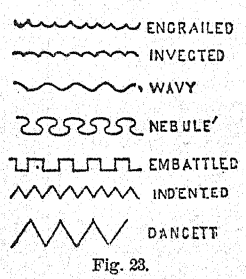


Fig. 23.

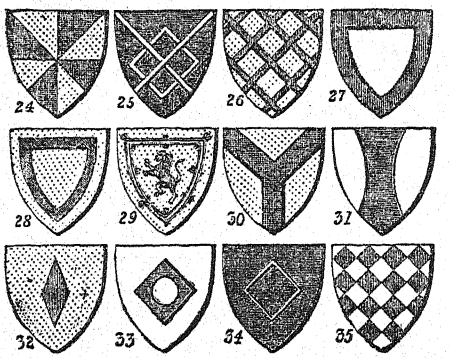
The partition-line which bounds the field, or the boundary-line of an ordinary, is not always even. Fig. 23 represents the commonest forms of irregular partition-lines in use, viz., the *engrailed, invected, wavy, nebulé, embattled, indented*, and *dancetté*. An ordinary engrailed has the points of the engrailed line turned outwards, and an ordinary invected, inwards. Dancetté differs from the indented by the partition-line being marked with only three indentations.

The *subordinaries*, or subordinate ordinaries, are generally enumerated as the following, though there is no very broad line of demarkation between them and the common charges.

1. The *gyron.*—When a shield is at once quartered and party per saltire, as in fig. 24, the division is called *gyronny of eight* (from *gyrus*, a circle), and one of the triangles, or at least the triangle in dexter chief, is a gyron. Gyronny of six, ten, or twelve also occasionally occur, so called according to the number of the triangles.

2. The *fret* (fig. 25) is a cognizance derived from the banding or ornamenting of the shield, and a shield covered with this lattice-work decoration (fig. 26) is said to be *fretty.*

3. The *bordure,* or border (fig. 27), is a stripe encircling the shield. It is much used to distinguish different branches of a family, and is often charged with small devices, on which account it has sometimes been reckoned an honorable ordinary.



Figs. 24—35.

4. The *orle* (fig. 28) differs from a bordure in not touching the extremity of the shield.

5. The *tressure,* regarded as a diminutive of the orle, is generally borne double, and flory counterflory, as in the arms of Scotland, or, a lion rampant within a tressure flory counterflory gules (fig. 29).

6. The *pall* (fig. 30), the archiepiscopal ornament of that name, sent from Rome to metropolitans, and resembling in form the letter Y.

7. The *flanches* (fig. 31), the dexter and sinister sides of the shield cut off by a curved line. Flanches are always borne in pairs, and sometimes charged.

8. The *lozenge,* a figure of four equal sides, with the upper and lower angles acute, and the others obtuse.

9. The *fusil* (fig. 32), longer and more acute than the lozenge.

10. The *rustre* (fig. 33), a lozenge pierced round in the center.

11. The *mascle* (fig. 34), a lozenge perforated, and showing a narrow border. Mascles were probably originally links of chain-armor.

A field is said to be *lozengy* (fig. 35), *fusilly,* or *mascally* when divided by diagonal lines in the direction of these subordinaries. A field divided by horizontal and perpendicular lines into squares of different tinctures is said to be *checky;* in the case of a *fess checky* there are three such rows of squares.

Among subordinaries are sometimes reckoned certain circular charges called *roundels* or *roundlets,* distinguished in English heraldry by different names according to their tinctures. When of or, they are called *bezants;* of argent, *plates;* of gules, *torteaux;* of azure, *hurts;* of purpure, *golpes;* and of sable, *ogresses* or *pellets.*

We now come to the third class of figures occurring in armorial bearings. We have seen that the ordinaries and subordinaries are for the most part purely heraldic figures, connected in their origin with the shield itself; the *common charges,* on the other hand, are representations more or less conventional of familiar objects, which have no necessary relation to the shield; but are in some way emblematic as concerns family or individual history and character. The knights, in the early days of heraldry, ransacked the animal, the vegetable, and the mineral kingdom, as well as the range of things natural and artificial, for cognizances which would be distinctive, and at the same time suggestive, of the name or title of the bearer of them. We can only enumerate a few of the charges of most frequent occurrence.

Of beasts, the *lion* requires special mention. The king of beasts is one of the most frequent of heraldic devices, and is made to assume a great variety of attitudes, for which see Lion. Lions and other beasts of prey are said to be *armed* or *langued* of any tincture when their teeth and claws, or their tongue, is of that tincture. With some change of color or position, the royal beast came to be used by all who could claim kindred, however remote, with royalty, and lions were further multiplied by augmentations granted by the sovereign to favorite followers. The heraldic *leopard,* which has been the subject of much controversy, was originally but another designation for the lion passant-gardant. Bears, boars, bulls, stags, are favorite heraldic beasts. A stag walking is said to be *trippant;* he is *at gaze* when a lion would be statant-gardant; he is *attired* of any tincture when his horns are of that tincture. The animals that possess horns and hoofs are said to be *armed* and *unguled* in respect of them. The heads and limbs of animals are often borne as charges, and they may be either *couped,* cut off in a straight line, or *erased,* cut off with a jagged edge.

Of birds, we have first the *eagle.* The sovereign of birds, and symbol of imperial Jove, was, next to the lion, the most favorite cognizance of royal personages, and was adopted by the German emperors, who claimed to be successors of the Cæsars of Rome. The imperial eagle had at first but one head; the monstrosity of a second head seems to have arisen from a dimidiation of two eagles, to represent the eastern and western empire (see Marshaling of Arms). The eagle of heraldry is most generally *dis-*

played, i.e., its wings are expanded; sometimes it is *preying*, or standing devouring its prey. The *alerion*, the cognizance of the duchy of Lorraine and the family of Montmorency, was originally but a synonym for the eagle assumed (M. Planché suggests) as an anagram for the word Loraine, but modern heralds have degraded it into a nondescript creature without beak or claws. The *martlet* was originally a martin, a species of swallow, which has also in course of time been deprived by heralds of its legs and beak. The pelican, the swan, the cock, the falcon, the raven, the parrot or popinjay, and the peacock, are all of tolerably frequent occurrence. The *pelican* has generally her wings *indorsed*, or placed back to back, and is depicted pecking her breast. When in her nest feeding her young, she is called a pelican *in her piety*. A *peacock* borne affronté with his tail expanded is said to be *in his pride*. Birds of prey are *armed* of the color of which their beak and talons are represented. Such as have no talons are *beaked* and *membered*. The *cock* is said to be *armed*, *crested*, and *jelloped*, the latter term referring to his comb and gills. Birds having the power of flight are, in respect to their attitude, *close*, *rising*, or *volant*.

Fishes and reptiles occur as charges: the former are said to be *naiant*, if drawn in a horizontal, and *hauriant*, if drawn in a perpendicular position; and the *dolphin*, in reality straight, is conventionally borne *embowed* or bent. The *escallop shell* is of frequent occurrence, and said to be the badge of a pilgrim. Sometimes the conventional heraldic form of an animal differs from its true form, as in the case of the *antelope* of heraldry, which has the head of a stag, a unicorn's tail, a tusk issuing from the tip of the nose, a row of tufts down the back of the neck, and similar tufts on the tail, chest, and thighs. Of "animals phantasticall" we have among others the griffin, wyvern, dragon, unicorn, basilisk, harpy. We have the human body in whole or part, a naked man, a savage, or wild man of the woods, also arms, legs, hearts, Moors' heads, Saracens' heads, and that strange heraldic freak, the three legs conjoined, carried in the escutcheon of the Isle of Man.

Of plants, we have *roses*, *trefoils*, *cinquefoils*, *leaves*, *garbs* (i.e., sheaves of corn), *trees*, often *eradicated* or *fructuated* of some other color, and, above all, the celebrated *fleur-de-lis*, used as a badge by Louis VII. of France before heraldry had an existence. When a plant, animal, or other charge is blazoned *proper*, what is meant is that it is of its natural color.

The heavenly bodies, the sun, moon, and stars, are also pressed into the service of heraldry, as are things inanimate and artificial without number, particularly such as were familiar to the warriors and pilgrims of the 12th and 13th centuries. Helmets, buckles, shields, hatches, horseshoes, swords, arrows, battering-rams, pilgrims' staves, mullets (or spur-rowels), and water-bougets, or bags, in which in crusading times water was carried long distances across the desert, also the clarion or war-trump, generally and erroneously called a *rest*. Even the letters of the alphabet have been used as charges.

Charges may be placed either simply on the field or on one of the ordinaries; in some instances, one of the ordinaries is placed over a charge, in which case the charge is said to be *debruised* by the ordinary. Three charges of one kind are placed two above and one below, unless blazoned *in fess* or *in pale*. In the 14th and 15th centuries, the simplicity of early heraldry began to be departed from by accumulating a variety of charges on one shield, and in later times we have sometimes a charge receiving another charge like an ordinary. The growing complexity of shields arose from augmentations granted to distinguish the younger branches of a family, or charges assumed from the maternal coat by the descendants of an heiress. In the end of the last and beginning of the present century, a practice prevailed for a time of introducing into armorial bearings matter-of-fact landscapes, representations of sea-fights, and of medals and decorations worn by the bearer, setting all heraldic conventionalities at defiance, and dealing in details not discernible on the minutest inspection. Such charges are frequent in the arms of the heroes of the old wars; as, for example, in the augmentation granted to sir Alexander Campbell, bart., in addition to his paternal arms—viz., "a chief argent charged with a rock proper, subscribed *Gibraltar*, between two medals; that on the dexter representing the silver medal presented to sir A. Campbell by the supreme government of India, for his services at the storming of Seringapatam, in 1799; that on the sinister representing the gold medal presented to him for his services in the battle of Talavera." The grants proceeding from the present kings-of-arms are more conformable to the usages of heraldry, and do not stand in need of such lengthened explanations to make them intelligible.

The arms of the different members of a family have been distinguished from one another, sometimes by the use of a bordure or other difference; and sometimes, especially by English heralds, by the use of certain figures called *marks of cadency*, the *label*, *crescent*, *mullet*, *martlet*, *annulet*, *fleur-de-lis*, to designate the eldest, second, third, fourth, fifth, or sixth son and his descendants—an invention originating about the time of Henry VII., but which cannot consistently be carried through all the ramifications of a family for a succession of generations. See CADENCY.

Blazonry is an essential part of the science of arms. To blazon a coat is so to describe it that any one with an ordinary knowledge of heraldry will be able to depict it correctly. In the language of blazonry, all tautology must be avoided. The tincture of the

field is first mentioned; the ordinary, if any, follows, unless it be a chief; then the charges between which the ordinary is placed. The charges on the ordinary follow, and lastly we have a canton or chief, and marks of cadency. The rules of blazoning are given in the articles BLAZON, BLAZONRY.

Besides the heraldic devices depicted on the shield, there are the following borne external to it—the helmet, the mantling, the wreath, the crest, the motto and scroll, the supporters, and the coronet.

The *helmet*, originally a piece of defensive armor, became in the course of time one of the usual accompaniments of the shield; and, placed over the arms, it came by its form to mark the rank of the wearer. For these distinctions, which are of comparatively recent date, and applicable only to British heraldry, see HELMET.

The *mantling* is an embellishment of scroll-work flowing down on both sides of the shield, and originating in the *cointoise*, or scarf, wrapped round the body in the days of coat-armor.

From the center of the helmet, within a *wreath* of two pieces of silk of the first two colors of the armorial bearings, issues the *crest*, originally a special mark of honor worn only by heroes of great valor, or advanced to a high military command; now an inseparable adjunct of the coat of arms in English, though not in continental heraldry, and often assumed or changed arbitrarily without proper authority.

The *scroll*, placed over the crest or below the shield, contains a *motto* bearing in many cases an allusion to the family name or arms.

Supporters are figures or animals standing on each side of the escutcheon, and seeming to support it. They were in their origin purely ornamental devices, which only gradually acquired a heraldic character. In England, the right to use supporters is confined to the royal family, peers, peeresses, and peers by courtesy, knights of the garter, knights grand cross of the Bath, and a very few families whose ancestors bore supporters before their general use was restricted. In Scotland, supporters are also used by the baronets of Nova Scotia and the chiefs of various families.

The crown of the sovereign, the miter of the bishop, and the coronet of the nobility are adjuncts appended to the shield of those whose dignity and office entitle them to that distinction. For a description of the crown of Great Britain and the coronets of the royal family, see article CROWN. Under the articles DUKE, MARQUIS, EARL, VISCOUNT, and BARON, the coronets appropriated to the different ranks of the nobility are described.

The subject of *marshaling arms*, or arranging various coats in one escutcheon, is explained in a separate article. Here it may suffice to lay down a few general rules. A husband is entitled to *impale* the arms of his wife, i.e., to place them on the same shield side by side with his own. When the wife is an heiress, the husband bears her arms in an *escutcheon of pretense*, or small escutcheon in the center of his own shield, and the descendants of the heiress may quarter her arms with their paternal coat. A sovereign also quarters the arms of his several states, and feudal arms are sometimes quartered by subjects. An elective king, it is said, may place his hereditary arms on an escutcheon of pretense over the insignia of his dominions.

For information on the details of heraldry, reference is made to the standard works of Guillim, Edmonson, and Nisbet; and for a more discriminating view of the subject, to such recent treatises as Montague's *Heraldry* and Planché's *Pursuivant of Arms*.

HERALD'S COLLEGE, or COLLEGE OF ARMS, a collegiate body, founded by Richard III. in 1483, consisting of the heraldic officers of England, who were assigned a habitation in the parish of All-hallows-the-Less, in London. Various charters confirmed the privileges of the college of arms, and it was reincorporated by Philip and Mary, who bestowed on it Derby house, on whose site in Doctors' Commons the present college was built by sir Christopher Wren.

The presidency of the college is vested in the earl-marshal, an office now hereditary in the family of Howard duke of Norfolk; he nominates the three kings-of-arms, six heralds, and four pursuivants, who are the members of the collegiate chapter. Persons having a hereditary claim to arms, which has been disused for one or more generations, are empowered by the heralds' college to resume them, on proof and registration of pedigree. A person who has no hereditary claim, and wishes a grant of arms, must memorialize the earl-marshal, and show that he is in a condition to "sustain the rank of gentry." An important department of the heralds' college is the recording of pedigrees. Any pedigree showing the existing state or descent of a family may, if accompanied with sufficient evidence, be entered on the books of the college. The members of the college have salaries, but derive their principal income from fees charged for assistance in tracing pedigrees and titles, and for the granting and registration of arms. In Scotland, the corresponding functions belong to the LYON COURT (q.v.).

HERAT', capital of the most westerly of the three divisions of Afghanistan, stands on the river Heri, at the height of 2,500 ft. above the sea. Lat. 34° 50′ n., long. 62° 30′ e.; distance from Cabul, 390 m. west. Situated near the boundaries at once of Afghanistan, Persia, and Independent Tartary, Herat is one of the principal marts of central Asia, carrying on at the same time extensive manufactures of its own in wool and leather. The vicinity, naturally fertile, has been artificially rendered much more so by means of irrigation. But the city claims notice mainly on political and military grounds.

Long the royal seat of the descendants of Timur, and often a bone of contention between the warlike tribes all round, it is fortified by a ditch and wall, and is commanded on its n. side by a strong citadel. In more modern times, the place has acquired a kind of European importance, being, towards Persia, the key of Afghanistan, which, again, in turn affords the only approach by land to western India. In this connection, Herat has been viewed as an outpost of England's eastern empire against Russian intrigue and encroachment. Hence it has been alike the subject of treaties and the occasion of wars between Great Britain, as the mistress of Hindustan, and Persia, as virtually a vassal of Russia. This feature of the history of the city was more specially developed in connection with the last conflict between Persia and England. In Nov., 1856, the shah, regarded by the British government as the vassal and agent of the czar, captured Herat, while actually conducting negotiations for an amicable adjustment at Constantinople; but he was within a few months constrained to relinquish his prey and renounce his claims by a British expedition directed against the opposite extremity of his empire. According to different estimates, referring, however, to different epochs, the population has varied from 20,000 to 70,000.

HÉRAULT, a maritime department in the s. of France, bounded on the s.e. by the gulf of Lyon, is oval in form, and is 84 m. in greatest length from e. to west. Area, 2,436 sq. m.; pop. '76, 445,053. It is occupied in the n. and n.w. by the Lower Cévennes, from which several branches of moderate elevation run toward the s., gradually subsiding as they approach the sea. The principal rivers are the Hérault (from which the department derives its name), the Orb, and the Lez, which, rising in the Cévennes, pursue a generally southward course to the Mediterranean. The coast-line is about 66 m. in length; and along the shore, from Agde to the Vidourle, are numerous *étangs*, or marshy lakes, united by the Canal-des-étangs, and communicating with the sea. In the neighborhood of the *étangs* the climate is unhealthy, especially in summer, when agues and fevers prevail; but elsewhere throughout the department it is unusually fine. About a fourth of the entire area consists of arable land, and about a sixth is under vineyards. The department of Hérault stands, for quantity at least, at the head of the wine-growing departments of France, 46,552,000 gallons being the average annual produce. From the shore-lakes and the sea immense quantities of fish are obtained. Woolen, silk, and cotton fabrics, in great variety, are largely manufactured. Coal and copper mines, as well as quarries yielding variously veined marbles, building-stone, granite, etc., are worked. This department supplies a great quantity of the salt used in France. It is divided into four *arrondissements*. Montpellier is the capital.

HERBA'RIUM, the name usually given to a collection of dried plants, intended for the future study and examination of botanists. For collecting plants, a box of tinned iron, called a *vasculum*, is generally used, which preserves most plants from withering for at least some hours. Plants intended for the herbarium should be collected on a dry day; plants which when gathered have moisture on their leaves should, when brought home, be placed in a vessel of water, and there allowed to dry. Plants with thick succulent stems or leaves are immersed for a few seconds in hot water to kill them. The specimens are then laid between layers of blotting-paper, or of a thick bibulous kind of paper called botanical drying-paper, not spread out with anxious minuteness, nor so placed as to distort their parts. The number of sheets of paper in each layer is accommodated to the nature of the plants, and pressure is applied by means of weights, screws, or straps, the whole being inclosed in boards, and the layers of paper, when very numerous, having also boards occasionally interposed. Care must be taken that too much pressure be not applied at first, lest the parts of the plants be unfitted for future examination. For a short time, the paper is changed every day, or every second day, dry paper being supplied. Specimens have the best appearance which are quickly dried. Some plants which, in spite of all care, lose their natural colors in the ordinary method of drying, and become black, as orchids, may be beautifully dried by inclosing the layers of paper in a network wire-frame, and hanging the package before a fire, where it is turned round like meat roasting. Specimens are thus dried in a few hours, which otherwise would have required eight or ten days.—When the specimens are fully dried, they are laid within sheets of writing-paper, or they are gummed or glued to sheets of paper, the name of the species, with the locality, date of collection, and any other interesting particulars, being marked beside each. As much as possible of each plant is preserved in the herbarium, but the flower and leaf must always be exhibited. Some parts of plants, as succulent roots, fruits, etc., are otherwise preserved. The herbarium is arranged according to a botanical system. Care must be taken to preserve it from the ravages of moths and beetles by frequent inspection, by the aid of camphor, and by the occasional application of a little corrosive sublimate. There are herbaria in existence which are now some centuries old, and which are still consulted for the identification of species. The herbarium enables us to compare plants which flower at different seasons, and those of different countries. The herbaria formed by travelers have been of great importance to the progress of botany.

HERBART, JOHANN FRIEDRICH, a German philosopher, was b. at Oldenburg, May 4, 1776. He was educated at Jena. At a very early age, he was familiar with religious and metaphysical doctrines and discussions, and at twelve years had read the systems of

Wolff and Kant. He became the pupil of Fichte, and received his philosophy with enthusiasm; but after more reflection, he found himself obliged to reject much of his system, and to form one of his own. In 1805 he was appointed extraordinary professor of Göttingen; in 1809 he obtained the chair of philosophy at Königsberg. In 1833 he returned to Göttingen, where he remained till his death, Aug. 14, 1841. His collected works were published by his scholar Hartenstein (12 vols., Leip. 1850–52).

The starting-point of Herbart's metaphysics is the thesis that the ordinary (metaphysical or popular) conceptions of a thing with attributes, change, matter, and self-consciousness contain in themselves contradiction. The multiplicity and variety of the world of phenomena cannot be explained on the hypothesis of only one real (substance); a multiplicity of reals (monads) must be assumed, and out of their mutual relations time, space, nature, and thought arise. In ethics, Herbart rejects Kant's autonomy of the pure reason as basis, and founds on developed and cultured feeling or common-sense—in this resembling Shaftesbury. The five practical ideas are freedom, perfection, benevolence, justice, and fairness. In psychology, Herbart endeavored, by regarding ideas or states of mind as so many physical forces, to understand their relations to one another at any given time by help of a most elaborately wrought-out mathematical calculus. The *Pædagogic* of Herbart is admirably practical. In opposition to contemporary idealism, Herbart called his system realism. On the fall of Hegelianism in Germany, Herbart's system became very influential, and has still numerous adherents in the German universities.

HERBELOT, BARTHÉLEMY D', a celebrated orientalist, was b. in Paris, Dec. 4, 1625, and finally became professor of Syriac in the college of France. He died at Paris, Dec. 8, 1695. His celebrated work, the *Bibliothéque Orientale,* was published after his death by Galland (Paris, 1697), and afterwards with a supplement (Maestricht, 1776–81); but the best edition is that published at the Hague (1777–82, 4 vols.). It is unfortunate that Herbelot was unable to give the finishing touch to a work which had cost him so much labor and research, and which, in spite of the errors, repetitions, contradictions, and omissions which one meets with, still bears a deservedly high character. It contains extracts from a multitude of Arabian, Persian, and Turkish authors.

HERBERT. This name, which stands forth prominently upon the records of British history, has been ennobled at various times, in so many of its branches, by so many ancient and renewed creations, that it has become a matter of difficulty to ascertain with certainty which is the parent stem; though sir Bernard Burke is inclined to give the representation of the house to Henry Arthur Herbert, M.P., of Muckross, co. Kerry. It is certain that the Herberts came over to England in the train of William the conqueror, for Herbert, count of Vermandois, who afterwards filled the post of chamberlain under William II., is mentioned in the roll of Battle abbey, and received from his sovereign a grant of lands in Hampshire. His wife Emma, daughter of Stephen, count of Blois, was a granddaughter of the conqueror, and his son Herbert (called in history Herbert of Winchester) was chamberlain and treasurer to king Henry I. Seven or eight generations later, we find the Herberts diverging into several distinct branches, including the lines of the earls of Powis (now extinct in the male line), of the lords Herbert of Cherbury (also extinct), the Herberts of Muckross (ancestors of the gentleman mentioned above), and also several untitled branches which have flourished upon their ancestral lands in England, Wales, and Ireland. In the reign of Henry V., sir William Herbert, of Raglan castle, co. Monmouth, received the honor of knighthood in reward of his valor in the French wars. His eldest son, a stanch adherent of the house of York, was created earl of Pembroke* by Edward IV. in 1469, but fell into the hands of the Lancastrians after the battle of Danes moor, and was beheaded the following day, when the title became extinct. It was, however, revived in 1551, in the person of his (illegitimate) grandson, William Herbert, K.G., one of the most influential noblemen of his age, and one who took an active part in public affairs, both as a statesman and as a soldier. It is recorded by sir B. Burke that "he rode on Feb. 17, 1552–53, to his mansion of Baynard's castle, with 300 horse in his retinue, 100 of them being gentlemen in plain blue cloth, with chains of gold, and badges of a dragon on their sleeves." He was buried in old St. Paul's, and his funeral was conducted on such a scale of magnificence that, according to Stowe, the mourning given away on that occasion cost £2,000—a very large sum in those days. By his wife, who was a sister of Catharine Parr (the last queen of Henry VIII.), he had a son Henry, second earl, K.G., to whose countess, Mary, daughter of sir Henry Sydney, K.G., sir Philip Sydney dedicated his *Arcadia.* She is celebrated by Ben Jonson in the well-known lines—

> Underneath this marble hearse
> Lies the subject of all verse—
> Sydney's sister, Pembroke's mother.

The fourth earl, some time lord chamberlain to Charles I., and chancellor of the university of Oxford, was the founder of Jesus college in that seat of learning. The eighth earl held several high offices under queen Anne, including that of lord high admiral.

*The earldom of Pembroke was originally conferred on Richard de Clare, the celebrated Strongbow, who aided Henry II. in the conquest of Ireland.

From him the present earl of Pembroke (George Robert Charles Herbert, born in 1850) is directly descended. The late lord Herbert (q.v.) of Lea—better known as Mr Sidney Herbert—was the younger brother of the late, and father of the present, earl. The earls of Carnarvon, more than one of whom have gained celebrity in the field of literature, descend from the eighth earl of Pembroke mentioned above. The present earls of Powis are descended from the same stock maternally, the only child and heiress of the last earl of Powis of a previous creation having married the eldest son of the illustrious Robert Clive, the founder of our Indian empire, in whose favor that title was renewed in 1804.

HERBERT, EDWARD, Baron Herbert of Cherbury, who is commonly reckoned the first of the English deistical writers, was b. of a noble family in the year 1581, at Montgomery castle, in north Wales. In his autobiography, he has described his early love for inquiry and his scrupulous truthfulness. He was sent to Oxford in his twelfth year, and before he had quite quitted his studies he married an heiress. On the occasion of the coronation of James I., he was made a knight, and invested with various offices. Although his marriage was happy enough, there appears to have been little warmth of affection between him and his wife, who was considerably older than himself. He left home, accordingly, for travel in France in 1608, and from this time resided very much abroad. In Paris, he lived on terms of intimacy with the constable Montmorency, Jean Casaubon, and other distinguished men. After a brief return to his native country, he set out again in 1610 for the low countries, where he joined the arms of the brave Maurice of Orange. For this prince he contracted a great affection, and again offered him his services in 1614. After a campaign, he traveled through Germany and Italy on horseback, and went as far as Venice, Florence, and Rome. On his return, he got into trouble from an attempt which he made to raise a troop of Protestant soldiers in Languedoc for the duke of Savoy. Shortly after, he returned to England, and proposed to devote himself to study and philosophical inquiry; but high and important diplomatic duties awaited him. He was made a member of the privy council, and sent to France as extraordinary ambassador. His aim was to promote the alliance between France and England, and he was so far successful that he was appointed ordinary ambassador, and continued to reside at Paris. He tried, but without much success, the difficult task of negotiation between Louis XIII. and his Protestant subjects. He was elevated first to be a peer of Ireland, and then in 1630, five years after the accession of Charles I., to be a peer of England, with the title of Baron Herbert of Cherbury. When the civil war broke out, he appears to have acted with hesitation, at first siding with the parliament and then joining the king. His hereditary seat, Montgomery castle, was attacked and burned. He died in London in the year 1648.

The character of Herbert, as depicted in his autobiography, is in the main that of a gallant adventurer, equally fired with the love of arms and of arts, at once a soldier and a scholar. He is the gay man of the world, always truthful, honorable, and high-spirited; yet he has thoughts above those of the world; he ponders deeply the great questions of truth and religion, and has left us the result of his speculations in his two treatises, *De Veritate* and *De Religione Gentilium*. The reader will find an admirable analysis of the first and more important of these treatises in Hallam's Literary History. They are only interesting to the philosophical student, or to the inquirer into the history of religious opinion in England. Herbert's position at the fountain-head of English deism gives them a peculiar significance. He is far, however, from being *skeptical*, in the modern sense of the term. His speculations are those of a philosophical dogmatist rather than of a critical inquirer. His arguments are abstract and deductive, and not analytical or negative. He offers solutions rather than starts difficulties or obtrudes negations; and in this respect Herbert is rightly reckoned the first of English deists, the writings of all of whom partake more or less of the same character; although it is not easy to trace any links of direct connection between him and the outburst of deistical literature in the end of the 17th and beginning of the 18th century.

HERBERT, GEORGE, an English poet, and fifth brother of lord Herbert of Cherbury (q.v.), was b. in Montgomery castle, Wales, on April 3, 1593. He was educated at Westminster, and was sent to Trinity college, Cambridge, about 1608. In 1615 he was elected fellow; and in 1619 he was promoted to the office of public orator. At the university he made the acquaintance of lord Bacon; and in the hope of preferment, he was induced to spend a considerable portion of his time about the court. On the death of James I., he studied divinity, and finally took holy orders. He was made prebendary of Leighton Bromswold in 1626. He married in 1630; and in the same year, received the rectory of Bemerton. Two years after, at the early age of 39, he died of the effects of a quotidian ague. His principal poetical production, printed in 1633, a year after his death, is entitled *The Temple, or Sacred Poems and Private Ejaculations*, and, although disfigured by fantastic conceits, contains several passages of the purest pious verse which the language possesses. He wrote a prose work, *The Country Parson*, which lays down rules for the guidance of a clergyman's life, and which may be considered a pendant to *The Temple*. His life was written by Izaak Walton, and to that

quaint and loving pen, even more than to his own *Temple* songs, he owes his immortality.

HERBERT, HENRY WILLIAM, 1807–58; b. London; the son of the dean of Manchester; graduated at Cambridge; emigrated to New York in 1831, and for eight years taught Greek in a private school. He was for three years (1833–36) editor of the *American Monthly Magazine*. In 1834 he began to publish works of fiction, of which seven or more appeared within 20 years. He wrote also a number of historical works; but his forte was as a writer on field-sports, on which subject, under the name of "Frank Forrester," he was without a rival. His works were very popular and are still in high repute. He was also an industrious editor, and a constant writer for magazines and newspapers.

HERBERT, JOHN ROGERS, b. England, 1810; studied in the royal academy and became a portrait and general painter. He was employed on the decoration of the houses of parliament, where he painted several frescos illustrating justice and its development in law and judgment. He is a member of the royal academy.

HERBERT, LORD, OF LEA (SIDNEY HERBERT), minister and statesman, son of the eleventh earl of Pembroke by his second wife, was b. at Richmond in 1810. Educated at Harrow and at Oriel college, Oxford, he devoted himself to public life, and entered the house of commons in 1832 as member for South Wilts, which he represented until his elevation to the peerage in 1861. He began his political career as a conservative, and was secretary to the admiralty in sir R. Peel's administration from 1841 to 1845, when he became secretary-at-war. As a member of this administration, it fell to him to oppose Mr. Cobden's motion for a select committee to inquire into the effect of the corn-laws on farmers, and, afterwards, to argue in support of free trade in corn. He went out of office with his party in 1846. In 1852 he was again secretary-at-war, under the Aberdeen ministry, and, in consequence, the "horrible and heart-rending sufferings" of the army before Sebastopol were laid in a great degree at his door. He was for a few weeks colonial secretary in the first administration of lord Palmerston in 1855, and secretary-at-war in his second administration in 1859. Great improvements in the sanitary condition and education of the army, the amalgamation of the Indian with the royal army, and the organization of the volunteer force, signalized his army administration. He largely reformed the war-office, and was devoting himself with equal zeal and intelligence to his ministerial duties, when, owing to failing health, he resigned his seat in the house of commons, and in 1861 was called to the upper house, under the title of Baron Herbert of Lea. But release from labor came too late, for he died Aug. 2, 1861. He was heir-presumptive to the twelfth earl of Pembroke. He had great aptitude for business, winning and genial manners, great readiness and fluency in debate, and a boundless philanthropy. He was a liberal patron of the arts; and his Lombardian church at Wilton, near his splendid abbey-seat in Wiltshire, will remain a lasting monument of his taste and munificence. He married, in 1846, the daughter of maj.gen. A'Court, niece of the first lord Heytesbury; and his eldest son, born in 1850, is now earl of Pembroke and Montgomery.

HERBERT, Sir THOMAS, 1606–82; an English traveler and author. He was in the suite of sir Dodmore Cotton, who was about to leave as ambassador for Persia in company with sir Robert Shirley. Sailing in March, 1627, they visited the cape, Madagascar, Goa, and Surat; having landed at Gombroon, they traveled inland to Asharoff, and thence to Cazbeen, where both the chiefs of the expedition died. Herbert reached England again in 1629, and in 1630, to his great disappointment, his patron the earl of Pembroke died suddenly. After this he traveled on the continent for more than a year. From his return in 1631 till about two years after his marriage in 1632 he retained his ambition for court favor, but failing in this he retired, probably to his estate of Tintern in Monmouthshire, till the outbreak of the civil war, when he sided with the parliament. In 1646 he was appointed to attend the king with his other servants. Becoming a devoted royalist, he continued with his majesty during the last two eventful years of his life, and at the restoration he was rewarded with the title of baronet. He resided at Westminster till the great plague, when he returned to York and bought Petergate house, where he died.

HERBIVORA, Lat. *plant-eaters*, an order of ungulate or hoofed mammals, which feed wholly upon vegetable food, using their limbs for support and locomotion only. The animals in this order have been differently classified by different naturalists. Cuvier divided them into two orders, the *pachydermata* and *ruminantia*. The pachydermata comprises the thick-skinned herb-eaters, as the elephant, rhinoceros, tapir, hog, hippopotamus, horse, and others. In the ruminantia, or cud-chewers, he placed the deer, the antelope, the sheep, the ox, and like animals. If Cuvier's orders are placed in one, then the herbivora will contain the suborders *proboscidians* (elephants), *tapiridians*, having long noses, but not prehensile or only very slightly so, as in the rhinoceros and tapir; the *suidians*, having long but not at all prehensile snouts, as the hog and the hippopotamus; the *solipedes*, or those having one toe only to each foot, and the *ruminants*, or the cud-chewers, having cloven hoofs. Agassiz, in his classification, placed the herbiv-

ora with the marsupials and carnivora as the three orders of the eighth class. This classification is not generally followed.

HERBS, or HERBA'CEOUS PLANTS, in botany, are those in which no persistent woody stem is formed above ground. In some, the stem is woody, but still annual. There is, however, in many a permanent woody *rhizome*, or root-stock.—In books of gardening, plants used only for flavoring are sometimes distinguished as *sweet herbs*, as mint, basil, etc.; whilst those valued for their nutritive qualities are known as *pot-herbs*.

HERCULA'NEUM, an ancient city of Italy, was situated at the north-western base of Mt. Vesuvius, about 5 m. e. of Naples. Considerable obscurity envelops its early history; it is supposed, however, to have been of Phenician origin, and to have been occupied afterwards by Pelasgians and Oscans. It subsequently was conquered, with all the rest of Campania, by the Samnites, and later it fell into the hands of the Romans. In 63 A.D. the city was seriously injured by a violent earthquake; and in 79 it was buried, along with Pompeii and Stabiæ, by the memorable eruption of Vesuvius (q.v.) which took place in that year. It now lies at a depth of from 70 to 120 ft. below the surface, and is filled up and covered with volcanic tufa, composed of sand and ashes, and consolidated to some extent by water, which is often thrown up in great quantities during volcanic eruptions. Above it, on the modern surface, are the two large villages Portici and Resina. In the latter, in 1706, on the occasion of deepening a well, fragments of mosaics were first brought up; but little was done in the way of systematic excavation till 1738, when explorations were commenced under royal authority. It was then discovered that the building near the bottom of the well, from which the first relics were obtained, was the theater. This building was forthwith explored and cleared, and several statues, both in bronze and marble, were extracted from it. Excavations were carried on but to a limited extent, not only in consequence of the hardness of the tufa, but from the fear of undermining the dwellings on the surface. Hence visitors can see only a very small portion of this entombed city. The chief edifice shown is the theater, which had been very large, and was built but a short time before the fatal eruption. It has 18 rows of stone seats, and could accommodate 8,000 persons. A basilica, two small temples, and a villa have also been discovered; and from these buildings many beautiful statues and remarkable paintings have been obtained. Among the art-relics of Herculaneum, which far exceed in value and interest those found at Pompeii, may be mentioned the statues of Æschines, Agrippina, the Sleeping Faun, the Six Actresses, Mercury, the group of the Satyr and the Goat, the busts of Plato, Scipio Africanus, Augustus, Seneca, Demosthenes, etc. These treasures, together with such vases and domestic implements as have been found, have been conveyed to the museum at Naples. Latterly, the portion of Herculaneum towards the sea, which had been covered only by loose ashes, has been laid open, and ancient buildings may now be seen there to advantage as well as at Pompeii.

HERCULES (Gr. *Herakles*), called likewise *Alcides*, after his grandfather Alcæus, was the son of Zeus and Alcmene, and the most celebrated hero of the Greek legends, the ideal of human perfection, as conceived in the heroic ages; i.e., the greatest physical strength, connected with every high quality of mind and character which these ages recognized. He had a bitter enemy in Hera, who, knowing that the child who should be born that day was fated to rule over all the descendants of Perseus, contrived to prolong the travail of Alcmene, who was the daughter of Alcæus, son of Perseus, and hasten that of the wife of Sthenelus, another son of Perseus, who, after a pregnancy of seven months, gave birth to a son, named Eurystheus. Eurystheus thus, by decree of Fate, became chief of the Perseidæ. Pindar and other subsequent writers relate that, while yet in his cradle, Hercules showed his divine origin by strangling two serpents sent by Hera to destroy him. By Amphitryon's care, he was instructed in all arts by the first masters. Amphitryon now sent him into the country, where he tended the flocks till he was 18 years of age. During this period, as the sophist Prodikos relates in his poem, Hercules, meeting the goddesses of Pleasure and Virtue at the crossways, chose the latter to be the constant companion of his life.

His first exploit was the slaying of a lion which haunted Mt. Cithæron and ravaged the dominions of king Thespios. Hercules was kindly received by the king, and at length succeeded in destroying the lion. On his return to his native city of Thebes, he not only freed it from the disgrace of having to pay tribute to the Orchomenians, but compelled them to pay double the tribute which they had formerly received. In return for this service, Creon, king of Thebes, gave him his daughter Megara in marriage. At this time, Eurystheus summoned Hercules to appear before him, and ordered him to perform the labors which, by priority of birth, he was empowered to impose upon him. Hercules, unwilling to obey, went to Delphi to consult the oracle, and was told that he must perform ten labors imposed by Eurystheus, after which he should attain to immortality. This reply plunged Hercules into the deepest melancholy, which Hera increased to madness, so that he killed his own children by Megara. When he recovered his senses, he returned, submitted to Eurystheus, and addressed himself to the performance of the labors imposed upon him.—The first labor was to destroy the lion which haunted the forests of Nemea and Cleonæ, and could not be wounded by the arrows of a mortal. Hercules boldly attacked him with his club, but in vain; and he was finally obliged to

strangle him with his hands. From this time, he wore the lion's skin as armor.—The second was to destroy the Lernæan hydra, which he accomplished with the assistance of his friend Iolaus; but because Hercules obtained assistance in this labor, Eurystheus refused to count it.—His third was to catch the hind of Diana, famous for its swiftness, its golden horns, and brazen feet.—The fourth was to bring alive to Eurystheus a wild boar which ravaged the neighborhood of Erymanthus.—The fifth was to cleanse the stables of Augeas, king of Elis, where 3,000 oxen had been confined for many years, which he accomplished in one day, by turning the rivers Alpheus and Peneus through the stables. But as Hercules had gone to Augeas, and offered to perform this service on payment of a tenth of the cattle, and concealed the fact that he had been commanded to perform it by Eurystheus, the latter, hearing of this, judged that it must not be counted as one of the labors.—His sixth was to destroy the carnivorous birds, with brazen wings, beaks, and claws, which ravaged the country near the lake Stymphalis, in Arcadia.—The seventh was to bring alive to Peloponnesus a bull, remarkable for his beauty and strength, which Poseidon, at the prayer of Minos, had given to Minos, king of Crete, in order that he might sacrifice it, which Minos afterwards refusing to do, Poseidon made the bull mad, and it laid waste the island. Hercules brought the bull on his shoulders to Eurystheus, who set it at liberty. It appears again as the Marathonian bull in the story of Theseus.—The eighth labor was to obtain the mares of Diomedes, king of the Bistones in Thrace, which fed upon human flesh.—The ninth was to bring the girdle of Hippolyta, queen of the Amazons.—The tenth labor was to kill the monster Geryon, and bring his herds to Argos. These were all the labors which were originally imposed on Hercules, but as Eurystheus declared the second and fifth unlawfully performed Hercules was ordered to perform two more.—The eleventh was to obtain the golden apples from the garden of the Hesperides. Atlas, who knew where to find the apples, brought them to Hercules, who meanwhile supported the vault of heaven; but according to others, Hercules went himself and stole the apples, after slaying the dragon who guarded them.—The last and most dangerous labor was to bring from the infernal regions the three-headed dog Cerberus. Pluto promised him Cerberus on condition that he should not employ arms, but only force. When Hercules had brought the monster to Eurystheus, the latter, pale with fright, commanded him to be removed. Hercules set him at liberty, whereupon Cerberus immediately sank into the earth. Hercules was now free from his state of servitude.

To these well-known "twelve labors" must be added many other achievements, such as his battles with the centaurs and with the giants; his participation in the expedition of the Argonauts; the liberation of Prometheus and Theseus, etc. After accomplishing all these exploits, Hercules, while in a state of mental aberration, murdered his faithful friend Iphitus; he was afterwards purified from the murder; but was compelled to sell himself for three years into slavery. When his period of slavery had expired, he returned to Peloponnesus, and some time afterwards became a suitor for the hand of Dejanira, the daughter of Œneus, king of Calydon, whom he married, after having overcome his rival Achelous. With her he now repaired to Trachinia. Having arrived at the river Evenus, he encountered the centaur Nessus. Hercules passed through on foot; but Nessus, under pretense of carrying Dejanira over, attempted to offer her violence; whereupon Hercules slew him with an arrow dipped in the poison of the Lernæan hydra. Nessus, before expiring, instructed Dejanira how to prepare a love-potion for Hercules. The hero now made war against Eurytos (king of Œchalia, who had defrauded him), slew him and his sons, and carried off his daughter Iole. Thence he went to Kenæon in Eubœa, and erected an altar to Zeus Kenæos. In order to celebrate the rite with due solemnity, he sent Lichas to Trachis for a white garment. Dejanira, being jealous of Iole, anointed the robe with the philter she had received from Nessus. Hercules put it on, and immediately the poison penetrated his bones. Maddened by the terrible pain, he seized Lichas by the feet and flung him into the sea. He tore off the dress, but it stuck to his flesh, which was thus torn from his bones. In this condition Hercules was conveyed by sea to Trachinia; and Dejanira, being informed of what had occurred, destroyed herself. Hercules himself repaired to Mt. Œta, where he erected a funeral-pile, and ascending it, commanded that it should be set on fire. The burning pile was suddenly surrounded by a dark cloud, in which, amid thunder and lightning, Hercules was carried up to heaven. There he became reconciled to Hera, and married Hebe.

According to most mythologists, there were several heroes of the name of Hercules. Among these are an Indian, an Egyptian, a Tyrian or Phenician, and a Theban Hercules. The last is the most celebrated, and to him the actions of the others have possibly been attributed. Others, who would explain the story of Hercules symbolically, pretend that it conceals an astronomical idea; while others discover in this myth the history of the early development of Greece. On the astronomical hypothesis, the twelve labors of Hercules are simply the course of the sun through the twelve signs of the zodiac, which the plastic poetry of the Greeks has converted into a legend. According to Max Müller, Hercules was the sun-god, and the legend of his death symbolizes the sunset: "In his last journey Hercules proceeds from east to west. He proceeds from the Kenæon promontory to Trachis, and then to Mount Œta, where his pile is raised. The coat which Dejanira sends to the solar hero is an expression frequently used in

other mythologies, it is . . . . the clouds which rise from the waters and surround the sun like a dark raiment. Hercules tries to tear it off, i.e., his fierce splendor breaks through the thickening gloom, but fiery mists embrace him, and are mingled with the parting rays of the sun, and the dying hero is seen through the scattered clouds of the sky tearing his own body to pieces, till at last it is consumed in a general conflagration." Comparative Mythology, in the *Oxford Essays*, 1856.

Festivals were celebrated in honor of Hercules, at which his exploits were sung. In this manner arose the *Heracleia*, long poems celebrating the life and actions of Hercules. Hercules is represented in plastic art as the ideal of a hero. Strength is the characteristic idea, which has been developed by the sculptors Myron and Lysippus in a form not to be surpassed. A complete series of representations of the twelve labors may be seen in the vases of Volce. The conflict with the giants very frequently occurs on vases of the oldest style; the one on the casket of Cypselos is particularly worthy of notice. Hercules's figure is generally youthful.

HERCULES, PILLARS OF, the name given by the ancients to the two rocks forming the entrance to the Mediterranean at the strait of Gibraltar. Their erection was ascribed by the Greeks to Hercules, on the occasion of his journey to the kingdom of Geryon. According to one version of the story, they had once been united, but Hercules tore them asunder, to admit the flow of the ocean into the Mediterranean; another version represents him as causing them to unite temporarily, in order to form a bridge. The pillars are not mentioned in Homer, though he speaks of Ulysses's passage out of the Mediterranean into the ocean and back, showing an apparent knowledge of the existence of the strait. The first author who mentions them is Pindar, who places them at Gades (Cadiz), and his opinion had many followers in later times. The most general opinion, however, identified them with Calpe (now Gibraltar) and Abyla (now Ceuta).

HERCULES BEETLE, *scarabæus Hercules*, or *dynastes Hercules*, a coleopterous insect of the family *lamellicornes* and tribe *scarabæides*, remarkable not only for its great size—it being 5 in. long—but for the singular appearance of the male; an enormous horn projecting from the head, and being opposed by a similar but smaller projection of the thorax, the whole resembling a pair of great but somewhat unequal pincers, of which the body of the insect is the handle. It is a native of Brazil.

HERCYN'IAN FOREST (Lat. *hercynia silva;* Gr. *herkynia hylē*, or *herkynion oros*), the general designation of the entire wooded mountain-range of middle Germany, from the Rhine to the Carpathian mountains. Different ancient writers, however, apply the name sometimes to one part, sometimes to another of the range. Aristotle makes the Ister (or Danube) take its rise in it. Cæsar, who estimates it at 9 days' journey in breadth, and 60 in length, comprehends under this name the whole of the mountain-ranges in Germany n. of the Danube; while some identify it with the Bohemian forest, and others with the Thuringian forest. Modern geographers apply the term, for the most part, in a very arbitrary manner.

HERDER, JOHANN GOTTFRIED VON, an illustrious German thinker, was b. at Morungen, in e. Prussia, in 1744, and studied philosophy at Königsberg under Kant, for whom he conceived an enthusiastic admiration, although subsequently he became one of his most resolute opponents. Here, also, he made the acquaintance of Hamann (q.v.), who first introduced him to the oriental languages and literatures, and made him appreciate the poetic beauty of the primitive civilizations. In 1764 he was appointed assistant professor and preacher at the cathedral school of Riga, where his sermons were greatly admired. Here he published his first works, *Fragmente über die neuere Deutsche Literatur* (Fragments on the Recent German Literature, 1767), in which, with bold and fiery vehemence, he attacked the wretched puerilities and errors of the national literature of the day, and the *Kritische Wälder* (lit., Critical Forests, 1769), once, but no longer, of great theological importance. These two works contain the germs of all that is essentially peculiar and characteristic in Herder's thinking. It was during a temporary residence at Strasburg that Goethe made his acquaintance. The latter was five years younger than Herder, and, as yet, nameless in literature; while Herder, by his *Fragments*, was kindling with new fire the soul of Germany. Goethe almost worshiped him; he tells us (in his autobiography) that the very handwriting of Herder exercised "a magical influence" (*eine magische gewalt*) over him. In 1775, on the recommendation of Goethe, he was invited to Weimar by the grand-duke, and appointed court-preacher and consistorial councilor. Here he resided until his death, which took place Dec. 18, 1803. Herder's writings are very numerous, amounting in all to 60 vols. (Stuttg. 1827–30). They may be divided into three classes: 1. Those relating to religion and theology; 2. Those relating to literature and art; 3. Those relating to philosophy and history. As a theologian his most important work is his *Geist der Hebr. Poesie* (Spirit of Hebrew Poetry, Dess. 1782; later edition, Leip. 1825; translated into English by Dr. James Marsh, 2 vols. Burlington, 1833). As a philosopher he has left behind him a fund of valuable observations on nature and mankind. His philosophical master-piece is his unfinished *Ideen zur Philosophie der Geschichte der Menschheit* (Ideas towards a Philosophy of the History of Mankind, 4 vols. Riga, 1784–91; 4th edition, with Luden's Introduction, 2 vols. Leip. 1841; translated into English by T. Churchill under the title, *Outlines of a Philosophy of the History of Man*). In this work all the

rays of his genius converge. His aim is to represent the entire history of the race as a series of events pointing to a higher destiny than has yet been revealed. His love and reverence for humanity are intense, pure, passionate. An ideal humanity, it might almost be said, is his divinity, in whose service he labors with restless zeal. That enthusiasm, however, which made Herder so effective as a mover of men's minds, had its fatal compensation in a deficiency of artistic excellence. His writings have not that fine perfection of style and method which will enable them to float down the stream of time unmolested. Among his other works may be mentioned his *Gedichte, Volkslieder*, and the *Cid*, the last of which is considered by the Spaniards themselves to be truly Spanish in its spirit. See Herder's *Lebenbild*, executed by his son (Erlang. 6 parts, 1846–47,)

HERD GRASS. See BENT GRASS.

HEREDIT'AMENT, in English law, a comprehensive word, including everything that goes to the heir-at-law. It is often divided into corporeal and incorporeal. Thus, a house or land held in freehold is a corporeal hereditament; while tithes, advowsons, etc., are incorporeal, being merely rights in connection with corporeal things. The word includes some things personal as well as real, as when a chattel right is carved out of an estate of inheritance.

HEREDITARINESS. The influence exerted by parents on the qualities of their offspring is universally admitted, but the relative amount of influence which each parent exerts is still to some extent an open question.

The general structure of the body, the height, the degree of development of the bones and muscles, the tendency to obesity or leanness, etc., seem to depend as frequently on one parent as on the other, in the case of man; but in many animals, as the dog, horse, etc., the father most frequently determines the general form and the size of the body.

The color and complexion of the offspring follow no definite rule. Sometimes the colors of the two parents appear undiluted in the offspring, as in the case of a piebald colt, resulting from the union of a bay stallion and a white mare, while in other cases an intermediate tint appears in the young. In the offspring resulting from the union of individuals of the dark and white human races, we have this intermediate tint developed; but it is believed that the color of the father usually predominates over that of the mother.

A very curious department of this subject is the transmission to the offspring of special marks or deformities exhibited by one of the parents or more remote ancestors, and not common to the species. Nævus (or mother's marks), moles, harelip, growths of hair in unusual places, an unusual number of fingers or toes, and special malformations of the heart and of other organs, have been frequently traced to hereditary influence. It is deserving of remark that these peculiarities have a tendency to show themselves in alternate generations, or even at greater intervals. Burdach, Blumenbach, and other eminent physiologists, have held the doctrine, that parents (whether dogs or men) who have suffered accidental or intentional mutilation of certain parts (as, for example, the tail, fingers, etc.,) often produce offspring which inherit these injuries; for instance, the dogs with cropped tails often produce pups with cropped tails. If the facts are true (which possibly may be doubtful), the results are probably due to an impression on the mother's mind rather than to an hereditary tendency. The immemorial practice of the Chinese in stunting the feet of their women has not produced a natural variety with that peculiarity.

Morell, in his *Introduction to Mental Philosophy*, observes that there are latent powers or tendencies which have been inherited, and which often remain unknown until brought out by peculiar circumstances. He gives the familiar example of the pointer. The habit of pointing at game is originally an acquired one; but so strongly does this habit become seated in the race, that the very first time the young pointer is taken into the field, he will stand and mark it, thus developing a purely hereditary instinct. "Exactly in the same way," he adds, "we find in man peculiarities of mind, temper, thought, habit, volition, etc., appearing and reappearing in families and races. Lord Brougham found some of his grandfather's writing exactly resembling his own [which is very peculiar], though the grandfather had died before he was born, and his father's was quite different." It is alleged that the children of skilled artisans are, as a rule, more apt at petty manipulation than the children of ordinary laborers, and that hence the population of certain towns—Birmingham, for example—has a great advantage over that of other towns in point of manufacturing industry.

It is well known that longevity or the reverse, a tendency to great fruitfulness or to sterility, peculiarities in the degree of delicacy in the external senses, and a special tendency to certain diseases—as gout, pulmonary consumption, cancer, etc.—are frequently transmitted in hereditary descent from one or other parent to the offspring. The predisposition to any certain special disease may be transmitted by either parent; but where both parents have been affected, the offspring are especially liable to suffer from it. Deformities and diseases, also, engendered by circumstances to which the exposure is lifelong, or affecting successive generations, are more certainly and conspicuously hereditary.

Hereditary Tendency to Mental Disease.—As the mental constitution in general is eminently propagable, the hereditary tendency in mental disease is more familiar and better demonstrated than in other forms of morbid action. One observer attributes six-sevenths of the cases of insanity to this cause. In France, and among the affluent classes, one case in every three; among the peasants, one in every ten, is found to occur in families predisposed to alienation. In Italy, the proportion is nearly the same. When stating that derangement is traced to transmitted taint, expression is given to the complex proposition, that individuals who have inherited an unhealthy cerebral organization, or bodily qualities, such as anæmia, incompatible with sound mental action, fall victims more frequently and inevitably to insanity than those physically and mentally robust would do. Experience shows that as particular forms of physical degeneration, such as rickets, consumption, in like manner particular species of alienation, are propagated in families; that the suicidal impulse appears in one, while the uncontrollable and insatiable desire for stimulants, is the heritage of a third. There are certain laws by which this proclivity seems to operate. Not merely are there more females than males actually insane, but there are more hereditarily disposed to be insane. In connection with this it must be observed that women are more exposed by constitution to the exciting causes of insanity than males, and that as infants they more readily acquire the mental tone of the mother. But, moreover, the madness of the mother is more frequently transmitted than that of the father. French authorities record that of 467 cases of mental affections, 279 were traceable to the mother: an English physician similarly records 76 out of 133. Where the taint exists on the side of the mother, a greater number of children, and a greater number of daughters, are born of unsound mind. But this disposition to disease of the nervous matter is manifested in the same family by different members, in various forms—as epilepsy, mania, eccentricity, or delusions. Even the last are exhibited in successive generations. Oxford, who fired at the queen, his father, and grandfather, all believed themselves to be St. Paul—Holland, *Medical Notes*, etc.; Lucas, *L'Hérédité Naturelle;* and Galton's *Hereditary Genius*.

HEREDITARY PRIVILEGES AND POSSESSIONS. The question of the admissibility of hereditary rights and privileges has been much agitated with regard to three points, especially in more recent times. The first is hereditary monarchy. The "divine" right of kings is now little urged, being felt to be incompatible with modern notions of the political relations of society; and the defense of the hereditary transmission of the supreme power of the state is rather rested on the ground of political expediency and necessity. The animosities and disturbances of public affairs that attend the ever-recurring election of a head of the state are avoided, it is argued, by making power hereditary in a particular family, and by a determinate law of succession; while the dangers and disadvantages which might arise from an authority depending upon the chance of birth, are capable of being neutralized by institutions which prevent the monarch from doing harm, even if there were not every reason to hope that self-interest will lead him to use the power which is the birth-right of his family, for the permanent honor and advantage of that family, and, therefore, of the community with which it is indissolubly bound up.

Another and perhaps more difficult aspect of the question is with regard to hereditary classes, dignities, and offices in the state over and above the hereditary monarch. One thing is now universally agreed upon, that the transmission in individual families of dignities, rights, and offices, involving essential parts of government, such as the supreme dispensation of justice, and other attributes of sovereignty, is inconsistent with the very idea of a state. The splitting up of Germany into a maze of petty sovereignties arising out of fiefs of the empire become hereditary, is a signal instance of the dangers of this principle. A hereditary nobility with such rights is no longer considered defensible. It is another question whether, as a political institution, a class with certain hereditary privileges may not be advantageous or even necessary as an element of stability, and as affording a source of trained statesmanship. Society has a longer life than the individuals that compose it, and should have further-stretching views—"looking before and after;" and it is chiefly in the great historical families of a nation, that such extended views grow up and and are cherished—families whose traditions form part of the national history, and which naturally identify their future with the national prosperity and dignity. Besides their traditions and well-developed national instincts, the individual members of such families enjoy other advantages as political and social leaders. Their usually good education, and their well-secured possessions which, in addition to a high sense of honor, raise them above having recourse to petty shifts and jobs, make them valuable as examples and as administrators in a commonwealth which aims at dignity and stability. Carried to an extreme length, as was the case in France prior to the great revolution, the hereditary privileges of the nobility became a source of social discontent and disorder; but limited as in the United Kingdom, hereditary privileges and dignities are found to be no way incompatible with the utmost social expansion, and are in reality so popular as to be admittedly a happy feature in the structure of society. It is further to be observed, that as great families with privileges and titles are from time to time dying out, while others, through distinguished public services, are raised to the rank of nobility, that degree of infusion of new blood is kept up which

gives vigor to the system, and at least prevents the British aristocracy from degenerating into an effete or antiquated caste.—As regards the economic view of hereditary right to private property, see J. S. Mill's *Political Economy*.

HEREDITARY RIGHT, strictly speaking, means the right of succession as an heir-at-law. The foundation of this right is nothing but convenience, the principle being, that if a man does not by will appoint his own heir, the law will do it for him; and the law, in doing this, proceeds according to certain degrees of relationship. It is therefore a mistake to suppose that there is anything in mere hereditary right which is divine, or superior to that which results from the radical right of ownership. It is a secondary and substitutional right, the principal and primary right being that by which the owner of land is entitled to say who shall at his death enjoy that land.

HERE'FORD, a city, parliamentary and municipal borough, and capital of the co of the same name, is situated in the fertile and highly cultivated valley of the Wye, 134 m. w.n.w. of London. The principal building is the cathedral, a noble edifice, which, after having been substantially restored, was reopened in 1863. St. James's church, built in 1868, is an ornament to the city. A very interesting old map of the world, said to date from the 13th c., and other geographical works, are deposited in the chapter-house and library. Besides many other public buildings, Hereford contains numerous benevolent and educational institutions, among the latter of which are several important free schools. Among its manufactures, which, however, are inconsiderable, gloves, hats, and flannel are the chief. Of its five annual fairs, that held in Oct. is perhaps the largest in the co. for cattle and cheese. Hereford returns two members to parliament. Pop. '71, 18,347.

HERE'FORDSHIRE, an inland co. in the w. of England, is bounded on the w. by s. Wales, and on the e. by the counties of Worcester and Gloucester. Area, 534,823 acres. Pop. '71, 125,370. The surface of the co. is hilly, with occasional valleys opening into wide-spread plains. Among the chief hill-ranges, are the Black mountains on the western, and the Malvern hills on the eastern border of the county. The whole of Herefordshire is in the basin of the Severn, and the general direction of the streams is s.e. toward that river. The Wye, with its affluents the Lugg, the Arrow, and the Teme, are the principal rivers. The climate of Herefordshire varies with the elevation and the exposure, but, as attested by the general longevity of the inhabitants, is on the whole exceedingly healthy. The soil is for the most part a deep, heavy, red loam, which produces good crops of grain, chiefly wheat, and is highly favorable to the growth of trees. Oaks and apple-trees abound, orchards are numerous, and cider is made in great quantity. Sheep and cattle of excellent breeds are extensively reared, and in the n.w. of the co. a useful breed of horses is produced. Agriculture is the chief employment of the inhabitants.

Herefordshire, or at least the greater part of it, formed a portion of the territory of the ancient Silures, and was conquered by the Romans in about 73 A.D. During the so-called heptarchy, it was included in Mercia. From its position on the Welsh border—a portion of the co. being included in the debatable land called the "Marches"—Herefordshire was long the scene of frequent contests.

HEREN'CIA, a t. of Spain, in the province of Ciudad Real, and about 40 m. n.e. of the city of that name. It carries on manufactures of soap, has a large weekly market and a pop. of 6,400.

HERERO'LAND, a region of s.w. Africa stretching n. from the Kuisip to the Cunene; 100,000 sq.m.: pop. 184,000, of whom but 300 are whites. Hereroland has a coast of 460 m., but the only point where it offers shelter and access to ships is Walfish bay, a safe but comparatively shallow harbor formed by Pelican point immediately to the s. of the mouth of the Kuisip. The country consists of three distinct physical regions: first, a long and narrow coast district backed by a very regular line of hills, of which the highest point appears to be Mt. Messum or Dourissa; secondly, a broad mountainous tract; and thirdly, a steppe region which stretches away into the Kalahari desert. The rivers are mere wadies which only at intervals succeed in bringing water as far as the sea. Except in the half-dry river-beds, the coast district is almost destitute of vegetation, the only edible fruit being the *nara*, which grows on the sand-downs, and is, according to Anderson, eaten by oxen, mice, men, ostriches, and lions. In the mountainous tract there are places of considerable fertility; large trees, as sycamores, etc., grow along the river-beds, and euphorbias, tamarisks, and a variety of strong-spined bushes prevail. In a few favored spots wheat can be cultivated, and from a single grain as many as 150 stalks may be produced. The coast range and many of the mountains are composed of granite and gneiss, broken by intrusive quartz and porphyry; further e. limestone formations, both carboniferous and oolitic, are predominant; and these again give place to sandstone strata, worn by the weather into table-shaped eminences. The granite and gneiss are being disintegrated with great rapidity. Both iron and copper are said to occur in considerable abundance, though the mineral exploitation of the country has had no satisfactory result. About 25 mineral springs, both hot and cold, are known to exist among the mountains.

HERESY (Gr. *Hairesis*) primitively means a *choice* or *election*, and in its application to religious belief is used to designate as well the act of choosing for one's self, and maintaining opinions contrary to the authorized teaching of the religious community to which one's obedience is due, as the heterodox opinions thus adopted and the party which may have adopted them. In the Acts of the Apostles (see Acts v. 17; xv. 5; xxiv. 5; xxviii. 22), the word seems to be used of a sect or party, abstracting from the consideration of its character, whether good or bad; but in the epistles and in the early Christian writers it is almost invariably used in a bad sense, which is the sense uniformly accepted in all subsequent theological literature. The notion of heresy, as understood by theological writers, involves two ideas: first, the deliberate and voluntary rejection of some doctrine proposed by the supreme authority established in any church as necessary to be believed; and secondly, a contumacious persistence in such rejection, with the knowledge that the belief of the doctrine is required of all the members of that particular religious community. Roman Catholic writers, regarding the authority of their own church as supreme and final, apply the name of heresy to any formal denial of a doctrine proposed by the Roman Catholic church as necessary to be believed. Protestant writers seldom use the word, except in relation to what each sect regards as the essentials of Christian faith. Beyond this point, indeed, the idea of heresy has no proper place in the dogmatical system of the Protestant sects, especially in reference to other communions than their own. In the Roman Catholic church, the supreme authority may be either the decree of a general council approved by the pope, or a dogmatical decree of the pope himself, expressly or tacitly received by the bishops of the various churches; and in general the crime of heresy is incurred in any church by the rejection of a doctrine which in that church is held to constitute an essential and integral portion of the Christian faith. Apostasy is the complete abandonment of the whole Christian doctrine, and the renunciation of the Christian profession. If the intellectual error be accompained by full deliberation, and by full knowledge of the motives of belief, the heresy is called *formal;* should it arise from ignorance or imperfect knowledge, it is styled *material;* and the heresy is held to be imputable, or the contrary, according as this ignorance is vincible or invincible.

Even in the apostolic times, heresies had arisen in the church, and before the council of Nice, the catalogue of sects had already swelled to considerable dimensions. Without attempting any enumeration of these heresies, it may be said in general that the sects of the early centuries are all reducible to two classes: (1) Those which attempted to associate the Christian doctrines with Judaism; (2) Those which ingrafted Christianity upon the Gentile religions or the Gentile philosophies. And this latter class naturally subdivides itself into (1) The sects which were tinged with the errors of the oriental philosophy; and (2) Those which drew their errors from the Grecian schools. Of all these we find traces, more or less distinctly marked, in the sects of the later ages.

From the very date of the establishment of Christianity in the Roman empire, heresy appears to have been regarded as a crime cognizable by the civil law; and Constantine enacted several severe laws for its repression, which were continued and extended by his successors, and were collected into a single title, *De Hæreticis*, in the Justinian code. The penalties of heresy ordained by these enactments are very severe, extending to corporal punishment, and even to death; and they all proceed on the distinct assumption that a crime against religion is a crime against the state. These enactments of the Roman law were embodied in the various codes of the European kingdoms; and in considering the history of the middle ages, it is necessary to recollect that the principle above referred to, as to the social bearing of the crime of heresy and of other crimes against religion, pervades the whole system of mediæval jurisprudence. It is further to be remembered, that the principles of many of the mediæval sects were anti-social and communistical, as well as opposed to the doctrines of the church; and that their leaders, in many instances, by adopting violent and revolutionary means for the propagation of their doctrines, drew upon themselves the punishment of anarchy and rebellion, as well as of heterodoxy in religion. Still, with even these allowances, Catholic historians themselves admit that the mediæval procedures against heresy were in many instances excessive, as were, indeed, also the processes and penalties of the criminal code.

In English law (2 Hen. IV. c. 15), heresy consisted in holding opinions contrary to Catholic faith and the determination of Holy church; and by common law the offender was to be tried in the provincial synod by the archbishop and his council; and, after conviction, was to be given up to the king to be dealt with at his pleasure, the king being competent to issue a writ *de hæretico comburendo;* but the statute above referred to empowered the diocesan to take cognizance of heresy, and on conviction, to hand over the criminal directly, and without waiting for the king's writ, to the sheriff-major or other competent officer. This statute continued practically in force, with certain modifications, till the 29 Charles II. c. 9., since which time heresy is left entirely to the cognizance of the ecclesiastical courts; but, as there is no statute defining in what heresy consists, and as, moreover, much of the jurisdiction of the ecclesiastical courts has been withdrawn by the various toleration acts; and, above all, as the effect of various recent decisions has been to widen almost indefinitely the construction of the doctrinal formularies of the English church, it may now be said that the jurisdiction of these

courts in matters of heresy is practically limited to preventing ministers of the established church from preaching in opposition to the doctrine and the articles of the establishment from which they derive their emoluments, and that, even in determining what is to be considered contrary to the articles, a large toleration has been juridically established. See the recent trial of Dr Rowland Williams, and the judgment given by Dr Lushington in the court of arches. For the history and literature of heretical sects, see the various ecclesiastical historians, as also Stockmann's *Lexicon Hæresium* (Leip. 1719); De Cæsari's *Hæresiologia* (Rome, 1736); Fritz's *Ketzerlexicon* (Würzburg, 1834); Arnold's *Ketzerhistorie* (Frankfort, 1699); Walch's *Geschichte der Ketzereien* (Leip. 1762); and Hilger's *Darstellung der Hæresieen* (Bonn, 1837).

HERETICS, (HERESY, *ante*), *First century:* Simonians (so called from Simon Magus) Cerinthians (Cerinthus) Ebionites (Ebion) and Nicolaitans (Nicholas, deacon of Antioch). *Second century:* Basilidians (Basilides), Carpocratians (Carpocrates), Valentinians (Valentinas), Gnostics (Knowing Ones), Nazarenes, Millenarians, Cainites (Cain), Sethians (Seth), Quartodecimans (who kept Easter on the 14th day of the 1st month), Cerdonians (Cerdon), Marcionites (Marcion), Montanists (Montanus), Tatianists (Tatian), Alogians (who denied the "Word"), Artotyrites, and Angelics (who worshiped angels). *Third century:* Patripassians, Arabici, Aquarians, Novatians, Origenists (followers of Origen), Melchisedecians (who believed Melchisedec was the Messiah), Sabellians (from Sabellius), Manicheans (followers of Manies). *Fourth century:* Arians (from Arius), Colluthians (Colluthus), Macedonians, Agoetae, Appollinarians (Appollinaris), Timotheans (Timothy the apostle), Collyridians (who offered cakes to the Virgin Mary), Seleucians (Seleucus), Priscillians (Priscillian), Anthropomorphites (who ascribed to God a human form), Iovinianists (Iovinian), Messalians, Bonosians (Bonosus). *Fifth century:* Pelagians (Pelagius), Nestorians (Nestorius), Eutychians (Eutychus), Theo-paschites (who said all the three persons of the Trinity suffered on the cross). *Sixth century:* Predestinarians, Incorruptibles (who maintained that the body of Christ was incorruptible), New Agnoetæ (who maintained that Christ did not know when the day of judgment would take place), Monothelites (who maintained that Christ had in his two natures but one will).

HERFORD, a t. of Prussia, in the province of Westphalia, is situated close to the frontier of Lippe-Detmold, on the Werre, 17 m. s.w. of Minden. Yarn-spinning, linen-weaving, and carpet manufactures are carried on. Pop. '75, 12,012.

HE'RI, HERI-RUD, or HURI, a river of central Asia, which rises in the Hindu Kush mountains, about 150 m. w. from Cabul, pursues a western course through Afghanistan, for more than 300 m. through a fertile and beautiful valley, in which stands the city of Herat (q.v.); then bending suddenly to the northward along the boundary between Persia and Turkistan, and afterwards n.w. through Turkistan, it has a further course of fully 400 m., till it terminates in the swamp of Tejend, 150 m. to the e. of the Caspian sea. After entering Turkistan, the Heri soon begins to lose its water in the sand of the desert, and the latter part of its course for hundreds of miles is dry, except at certain seasons of the year.

HERING, CONSTANTIN, b. Saxony, 1800; studied medicine in Germany, and accompanied Wiegel, the botanist, on his scientific expedition to French Guiana. About 1834 he settled in Philadelphia, where he soon became favorably known as a homeopathic physician. Among his works are *Rise and Progress of Homeopathy*, *The Domestic Physician*, and various essays.

HERIOT, in English law, is a kind of fine due in copyhold estates to the lord of the manor on the death of the copyholder, and consists of the best beast, jewel, or chattel that belonged to the deceased. The lord can enforce this right by action, or seize it *brevi manu*. Such a right is practically unknown in freehold estates in England. In Scotland, all land is held on much the same forms as copyholds; and much more vexatious things of a similar kind to heriots, under the name of reliefs, become due from a vassal's heir to the superior on the vassal's death. In both countries the practice is equally barbarous.

HERIOT, GEORGE, founder of a magnificent hospital at Edinburgh, the son of a goldsmith in that city, a descendant of the Heriots of Trabroun, East Lothian, was born in June, 1563. Admitted in May, 1588, a member of the Edinburgh incorporation of goldsmiths, he was, in 1597, appointed goldsmith to Anne of Denmark, consort of James VI. of Scotland, and soon after to the king, on whose accession, in 1603, to the English throne, Heriot went to London, where, as court-jeweler and banker, he amassed considerable riches. He died Feb. 12, 1624, without issue, and bequeathed the greater part of his wealth (£23,625) to the town-council and ministers of Edinburgh, to found and endow an hospital in that city for the maintenance and education of the sons of poor deceased or decayed burgesses. The noble structure of Heriot's hospital, from a design, it is believed, by Inigo Jones, was completed in 1649, at a cost of £30,000 sterling. After the battle of Dunbar, in 1650, Cromwell made it a military hospital; but in 1658 it was restored to the governors by gen. Monk; and in 1659, 30 boys were admitted. 216 boys are now maintained and educated in it, 96 of whom are non-resident. In 1766 the annual revenue was £1966. In 1837 it amounted to £11,235, leaving, in that year, a

surplus of £3,099. The yearly revenue is now upwards of £20,000. Most of the ground on which the new town of Edinburgh is built belongs to the hospital. The revenues greatly exceeding the expenditure, in 1837 an act of parliament was procured for the erection of schools in Edinburgh, for the education of poor children free of all expense. Of these "Heriot schools" there are 19—viz., 12 juvenile and 7 infant schools—attended by upwards of 5,100 boys and girls. The children who are eligible to these schools are, first, children of decayed burgesses and freemen; and, second, children whose parents are in poor circumstances, and who reside within the royalty of Edinburgh; but of late admission has also been given to the children of parents residing beyond that limit. There are also 9 free evening-schools, attended by 1100 young men and women. There is a system of bursaries connected with the hospital, both for the boys who are educated in it, and for others who are elected according to the discretion of the governors—"house bursars," £30 a year; and "out-bursars," about £20; the former established in 1810, the latter in 1825.

HERISAU, the largest t. in the Swiss half-canton of Appenzell-ausser-Rhoden, at the confluence of the Glatt and Brühlbach, 7 m. n.w. of Appenzell, and 2,550 ft. above sea-level. The town is irregularly built, and extends over a large area. The church-tower, in which the archives are kept, is referred to the 7th century. Herisau has a public library, an arsenal, a new town-house, and a hospital, and is the seat of the cantonal council and of a district court of justice. The manufactures comprise muslin, cotton, and silk. Christianity was introduced at Herisau (a name during the middle ages Latinized as Augia Domini) about the beginning of the 7th century. The nobles of Herisau were its first superiors, but their power passed in 1390 into the hands of the abbots of St. Gall, from whose somewhat oppressive rule the people bought themselves free in 1463. In the neighborhood beautiful walks lead to the interesting ruins of the castles of Rosenberg and Rosenburg. The baths and goat's-whey cure of Heinrichsbad are about a mile to the north-east.

HERISTAL, or HERSTAL, a considerable village of Belgium, in the province of Liege, extends along the left bank of the Maas for about 3 m., immediately below the city of Liege, of which it may almost be considered a suburb. Pop. about 7,000, principally workmen, who find employment in the coal-mines, the iron and steel works, which are here carried on. Some ruins still exist of the castle of Heristal, the birthplace of Pepin le gros (father of Charles Martel, and great-grandfather of Charlemagne), and from which he had his title of Pepin d'Heristal.

HERITABLE BOND, in Scotch law, is a bond for a sum of money, and joined with it a conveyance of land in security thereof. The usual deed is now a bond and disposition in security, corresponding to the English mortgage (q.v.).

HERITABLE JURISDICTIONS, a remarkable class of jurisdictions held hereditarily from the crown of Scotland, abolished (1748) by 20 Geo. II. c. 43. These jurisdictions amounted to upwards of a hundred in number, and consisted of sheriffships, stewartries, constabularies, but principally of regalities and bailieries, with some offices of distinction. One of the more important was the office of lord justice-general, and the lordship of Argyle and the isles, both belonging to the family of Argyle. In virtue of their hereditary rights, the possessors of these jurisdictions exercised an arbitrary power over vassals and others within the limits of their domain, and could punish them by fines, scourging, imprisonment, and even in some cases put them to death, without interference of the common law. As repugnant to social policy, and more particularly with the view of extinguishing the authority of highland chiefs over their clans, these heritable jurisdictions were abolished; the possessors receiving payment for the assumed value of their rights. Argyle alone received £21,000 as an indemnity, and altogether there was paid by government £152,037 12s. 2d. The abolition of these odious jurisdictions being followed by the appointment of sheriffs on a proper footing, this great legislative act marks an important era in the history of Scotland.

HERITABLE AND MOVABLE, a Scotch law-phrase denoting the distinctions of things which go to the heir and to the executors respectively. The distinction corresponds to a certain extent to the phrase "heir and executor" (q.v.) in England.

HERITABLE SECURITIES, the name given in the law of Scotland to what are called mortgages and charges on land in England. These were formerly distinguished into wadset, infeftment of annual rent, heritable bond, bond and disposition in security, and absolute disposition with back-bond, and also reserved burdens on land. All heritable securities are founded on the theory that they constitute a pledge of the land to the creditor until the debt is paid, or rather the debt is a burden on the land, so that whatever becomes of the land, into whatever number of hands it is conveyed and transferred, the debt still inheres in it, and must be first paid out of the proceeds, unless it is redeemed. In Scotland the principal heritable security is now called the bond and disposition in security, which consists of an obligation to pay the debt, and a disposition *pro tempore* to the creditor, by way of security till the debt is paid. The bond must be registered in the register of sasines, to complete the title, and it is assignable to a third party. A power is always given to the creditor to sell the estate, if the principal or

interest is not paid, in which case the creditor must account for the surplus after paying himself his debt.

HERITOR, in the law of Scotland, is the owner of land in a parish liable to public burdens. The heritors, collectively, have vested in them the fee of the church and churchyard; they repair the parish church, etc., and before the education act (1872) elected the parish schoolmaster.

HERKIMER, a co. in e. central New York, on the Mohawk river, intersected by the Erie canal and the New York Central railroad; 1400 sq.m.; pop. '75, 41,586. The surface is generally hilly, rising in the n. part into a spur of the Adirondack mountains. The soil, especially along the Mohawk valley, is very fertile. Chief productions: cheese, butter, hay, broom-corn, potatoes, and cattle. Co. seat, Herkimer.

HERKIMER, NICHOLAS, 1720–77; b. N. Y.; son of J. J. Erghemar, whose name became corrupted to Herkimer, a German emigrant. Nicholas commanded at Fort Herkimer in 1758 when an attack was made by the French and Indians. In the war of the revolution he was a colonel and led a force to the relief of Fort Stanwix. In Aug., 1777, he was wounded in a skirmish with the Indians, and died from the effects of amputation. Congress voted a monument to him, but it was never built.

HERMÆ. See HERMES.

HERMANDAD, THE (Sp. "Brotherhood"), an association of the principal cities of Castile and Aragon, bound together by a solemn league and covenant for the defense of their liberties in seasons of trouble. These confederacies were sanctioned by the sovereigns, as agents for suppressing the increasing power of the nobles, and for maintaining public security through the land with no cost to the government. In Aragon, the first hermandad was established in the middle of the 13th c., and in Castile about 30 years later; while in 1295, 35 cities of Castile and Leon formed a joint confederacy, and entered into a compact, by which they pledged themselves to take summary vengeance on every noble who had either robbed or injured a member of their association and refused to make just atonement for the wrong; or upon any one who should attempt, even by the order of the king, to levy an unjust tax. During the long period of anarchy in which the Christian rulers of Spain were impotent to maintain order in their own dominions, the *Santa Hermandad,* or holy brotherhood, had presented the only check against the unbounded license of the nobles; and Isabella of Castile, seeing the beneficial effects which an extension of the institution was capable of producing, obtained the sanction of the cortes for its thorough reorganization and extension over the whole kingdom in 1496. The crimes reserved for its jurisdiction were all acts of violence and theft committed on the highroads or in the open country, and the penalties attached to each misdemeanor were specified with the greatest precision in the codes of laws which were enacted at different times in the yearly assemblies of the deputies of the confederate cities. An annual contribution was, moreover, assessed on every hundred householders or *vecinos* for the equipment and maintenance of the horsemen and *quadrilleros* or officials of the brotherhood, whose duty it was to arrest offenders and enforce the sentence of the law. Although the hermandad was regarded with much disfavor by the aristocracy, it continued for many years to exercise its functions, until the country was cleared of banditti and the ministers of justice enabled to discharge their duties without hindrance from lawless disturbers of the peace. In 1498, the objects of the hermandad having been obtained and public order established on a firm basis, the brotherhood was disorganized, and reduced to an ordinary police, such as it has existed, with various modifications of form, to the present century. The laws enacted at different times in the juntas or assemblies of the hermandad were compiled, in 1485, into a code, known as the *Quaderno de las Leyes nuevas de la Hermandad,* which was first printed at Burgos in 1527.—See Mariana, *History of Spain;* Pulgar, *Reyes Catolicos;* Prescott, *History of Ferdinand and Isabella.*

HERMANN, FRIEDRICH BENEDICT WILHELM VON (1795–1868). A distinguished political economist, b. Bavaria; studied at the universities of Erlangen and Würzburg. His attention was directed to mathematics and political economy, and in 1817 he opened a private school at Nuremberg. In 1823 he became *privat docent* at the university of Erlangen, and a few years later was professor of mathematics at Nuremberg. His great work, *Staatswirthschaftliche Untersuchen* (Economical Researches), appeared in 1832, and three years later he was made member of the royal Bavarian academy of science. His life was a succession of active and energetic service. He was inspector of technical instruction in Bavaria; in 1839 assumed charge of the bureau of statistics; in 1845 was one of the councilors of the interior; and in 1848 sat as member for Munich in the national assembly at Frankfort, where he was instrumental in organizing the so-called "great German party," and representative of their views at Vienna. In 1855 he attained the highest honor to which he could aspire, and became councilor of state. He published a large number of reviews and papers in the various German newspapers, and as head of the bureau of statistics he published a yearly report of high value

HERMANN, or HERMAN, a name that first appears in Germany in the 6th c. after Christ, but is now become common. It has been erroneously transferred to that prince

or chief of the Cherusci, called by Roman writers Arminius, and by the Greeks Armenios. This personage was the son of Sigimer, and was born 16 B.C. The period in which the youth of Hermann was cast was fraught with the greatest peril to Germany. To secure the frontiers of the empire against the attacks of the Germanic tribes, the Romans had been forced to advance into the more turbulent districts, and to build a series of forts to overawe the inhabitants. In this manner, not only had most of the Celtic tribes, from the Alps to the Danube, been subdued, but in the years from 9 B.C. to 4 A.D., Drusus and Tiberius had penetrated into the n.w. of Germany as far as the Elbe, laid out a number of military roads, erected fortresses in the country, and reduced the different tribes to such dependence upon Rome, as virtually amounted to complete subjugation. With so much prudence and caution had Tiberius proceeded, that the Germans continued to all appearance on the best terms with the Romans, gradually adopted Roman habits, and frequently and readily took service in the Roman armies. Thus Hermann and his brother Flavius had enrolled themselves under the Roman standards, and as leaders of Cheruscan auxiliaries, had not only obtained Roman citizenship and the rank of knighthood in the country of the Danube, but had likewise acquired a knowledge of the Latin language, and a deep insight into the arts of war and policy, as practiced by the Romans. Enriched with these experiences, when Hermann, after the expiration of some years, returned home, he found the state of affairs considerably changed for the worse, through the unskillful despotism of the Roman viceroy, Quintilius Varus. Hermann now conceived the plan of delivering his country from its oppressors. All the tribes and leaders as far as the Elbe were secretly summoned; Varus was lulled into security, and induced to dispatch portions of his army to different points, and with the remaining portion, which was just on the point of leaving the country of the Cherusci for the Rhine, to quit the highway. He was thus lured into the impassable districts of the *Teutoburg forest* (either in the upper valley of the Lippe, or the adjoining Prussian territory); an engagement took place, which lasted for three days. The result was the annihilation of the whole Roman army (9 A.D.). When intelligence of this defeat reached Rome, it excited the greatest consternation and anxiety. The Germans, however, who had only their own liberation in view, prosecuted their victory no further; and for a few years both parties, so to speak, hung fire. When Germanicus (q.v.), however (14 A.D.), assumed the command on the lower Rhine, he resolved to crush the barbarians. In two successive campaigns, 14 A.D. and 16 A.D., he reduced Hermann to great straits; but he being recalled to Rome by the emperor Tiberius, 17 A.D., the results of his victorious activity were lost. From this time no Roman army ever ventured to penetrate from the Rhine into the interior of Germany, and this circumstance, which decided the future fate of Germany, must be ascribed chiefly to Hermann. Nevertheless, no sooner was the foreign enemy expelled, than the internal feuds broke out with more violence than ever. In the course of these, Hermann was slain by his own relatives, in the 37th year of his age and 12th of his leadership. Tacitus says of him: "He was, without doubt, the deliverer of Germany; and unlike other kings and generals, he attacked the Roman people, not at the commencement, but in the fullness of their power; in battles, he was not always successful, but he was invincible in war. He still lives in the songs of the barbarians, though unknown to the annals of the Greeks, who admire only what belongs to themselves; by the Romans, he is not estimated according to his merits, because in our admiration for the past, we neglect the present."—Compare Wietersheim, *Der Feldzug des Germanicus* (Leip. 1850); Massmann, *Arminius Cheruscorum Dux ac Decus, Liberator Germaniæ* (1839); Böttger, *Hermann, der Cheruskerfürst* (Han. 1874).—A colossal statue of Hermann, placed on a hill near the town of Detmold, was publicly unveiled on Aug. 16, 1875. The work, intended to be a national monument, is by the sculptor Bandel, who devoted to its completion a large portion of his life.

HER'MANN, JOHANN GOTTFRIED JAKOB, a German philologist of great genius and learning, was b. at Leipsic, Nov. 28, 1772; studied there and at Jena, and was made, in 1798, extraordinary professor of philosophy. In 1803 he was called to Kiel as ordinary professor of eloquence, becoming, in addition, professor of poetry in 1809, and in this position he remained till his death, Dec. 31, 1848. Distinguished by liberal-mindedness and love of truth, by eloquence and extensive culture, Hermann continued till his latest days to attract a large circle of students to his class-room, which sent forth some of the most celebrated teachers in the schools and universities of Germany. The first department which he began to cultivate on original principles was the science of meter, of which he attempted to develop a philosophical theory from the categories of Kant; and on this subject he wrote, besides his *Handbuch d. Metrik* (1798), several Latin treatises, among which his *Epitome Doctrinæ Metricæ* (1818) reached a third edition in 1852. Of wider importance, however, was the new method which he introduced into the treatment of Greek grammar, which has had its influence on the grammar of Latin, and even of modern languages, especially of the German. The principles of this method are not only explicitly developed in his *De Emendendâ Ratione Græcæ Grammaticæ* (1801), but are practically illustrated in his numerous editions of the ancient classics. Hermann's power of dealing with chronological, topographical, and personal questions, is shown in his *Opuscula* (7 vols., Leip. 1827–1830), which also contain some poems breath-

ing the spirit or Roman poetry. Consult Jahn's *Gottfried Hermann eine Gedächtnissrede* (Leip. 1849).

HERMANNSTADT (Lat. *Cibinium*, Hung. *Nagy-Szeben*), an important t. of Austria, capital of the crown-land of Transylvania, is beautifully situated on the Cibin, or Zibin, an affluent of the Aluta, about 70 m. w.n.w. of Cronstadt. Hermannstadt is the seat of the Austrian governor of Transylvania, and of a Greek non-united bishop, and is the head-quarters of the 12th corps of the imperial army. Tanning, wax-bleaching, and the making of cloth, combs, paper, and gunpowder, chiefly employ the (1869) 18,998 inhabitants, half of whom are Protestants.

Hermannstadt, originally a village, is called, on the ancient seal of the town, *Villa Hermanni*. The *Hermann* from whom the town has its name was a citizen of Nuremberg, and is said to have led hither a colony in the 12th century.

HERMAPH'RODITE, in botany, the term used to designate those flowers which contain both the male and female organs of reproduction (stamens and pistils), and are therefore by themselves capable of producing perfect seed. Flowers containing only male or female organs are called *unisexual* or *diclinous* (q.v.), and when produced on the same plant, *monœcious* (q.v.); when on different plants, *dicecious*. Hermaphrodite flowers are also called *monoclinous* (Gr. *monos*, one, and *kliné*, a couch) and *perfect* flowers.

HERMAPH'RODITE BRIG, or BRIGANTINE. See BRIG, *ante*.

HERMAPH'RODITISM is a term employed by naturalists to designate the state or condition of those organisms, whether animal or vegetable, in which the sexual characteristics of the male and female are united in the same individual. The name is derived from the fable of the union into one, of the bodies of Hermaphroditus, son of Hermes and Aphrodite, and the nymph Salmacis. See Ovid's *Metamorphoses*, lib. iv. v. 347.

There are two kinds of hermaphroditism, the true and the spurious; in the former, there is an actual co-existence, in the same individual, of male and female reproductive organs; while in the latter, there is only an appearance, from arrest or excess of development, of a union of the distinctive organs of both sexes. True hermaphroditism is the normal type of sexual structure in most plants. See HERMAPHRODITE, in botany. It likewise occurs normally in many of the lower invertebrata, and as a monstrosity in the higher invertebrata, and even occasionally in certain vertebrata.

The recent investigations of Balbiani show that certain infusoria (as, for instance, the common green paramœcium), at all events occasionally present the phenomena of hermaphroditism. In some of the polyps (as, for example, the hydra and some of the actiniæ), the sexes are united in the same individual; the same is the case with some of the acalephæ (namely, the ctenophora), with certain orders of helminthes or parasitic worms (the cestodes and trematodes), with certain annelides (the hirudinei and lumbricini, of which the leech and the earth-worm are typical examples), with many acephalous mollusks, with the pteropods and with most of the gasteropods; while in the highest order of mollusks, the cephalopods, the sexes are always distinct. Among the crustaceans, the cirrhipeds are for the most part hermaphrodites; but in the other and higher orders, if hermaphroditism exists, it is only as an abnormal occurrence, and gives rise to a monstrosity. (For example, the common lobster has been observed with male organs on one side of its body, and female organs on the other.) True but not normal hermaphroditism is also occasionally met with in insects. In 14 cases given by Oehsenheimer, the right side was male, and the left female; and in 9 cases it was the reverse. Prof. Owen remarks that in insects hermaphrodites are occasionally found, where the characters of one sex, instead of extending over one-half, are limited to particular parts of the body which agree in the main with the other sex. Thus, in an individual of *gastrophaga quercus*, the body, the antennæ, and the left wings were those of the female, while the right wings were those of the male.

True (but of course abnormal) hermaphroditism is far rarer amongst the vertebrata than in insects or crustaceans. Various instances, however, are on record of fishes presenting a lateral hermaphroditic structure, or a roe on one side and a milt on the other; and references to various cases that have been reported may be found in sir James Y. Simpson's learned and elaborate article, "Hermaphroditism," in *The Cyclopædia of Anatomy and Physiology*. The same article may be referred to for cases of similar hermaphroditism in birds and mammals, including the human subject, namely, cases in which there were female structures on one side, and male structures (more or less perfect) on the other.

Returning from these cases of abnormal true hermaphroditism to those of normal true hermaphroditism, the question naturally suggests itself—Can these true animal hermaphrodites, possessing male and female organs, fertilize themselves? As far as is known, none of the terrestrial hermaphrodites, such as land-mollusks (the common snail, for example) and earth-worms, are self-impregnating. They all pair, and in this respect offer a strong contrast with hermaphrodite plants. But of aquatic animals, there are many self-fertilizing hermaphrodites. For further details on the subject of hermaphroditism generally, the reader is referred to Steenstrup's *Untersuchungen über das Vorkommen des Hermaphroditismus in der Natur* (1846).

Spurious hermaphroditism is a subject of too purely a professional character to be noticed at all fully in these pages. Those who take an interest in this subject may be

referred for further information to sir James Y. Simpson's article, and to a case recorded a number of years ago in the *Lancet* by Dr. Girdwood.

HER'MAS, the name of one of those who were members of the Roman church at the time at which St. Paul wrote his epistle to the Romans, and, as may be inferred from the apostle's addressing a special greeting to him, a person of some eminence among his fellow-Christians. He was, though resident at Rome, most probably, judging from his name, of Greek origin. Hermas, however, has obtained even more consideration from the circumstance of his being the reputed author of the well-known early treatise, called *The Shepherd*, which is commonly classed among the writings of the apostolic fathers. It is ascribed to the Hermas of St. Paul, more or less positively, by Origen, Eusebius, and St. Jerome. But there is a second Hermas, who lived about the middle of the 2d c., a brother of Pius I., bishop of Rome, to whom the work is attributed by other writers, and it would seem with greater intrinsic probability. The work contains many allusions which appear to be directed specially against the Montanistic errors—a fact quite irreconcilable with the supposition of its having been written in the apostolic age. *The Shepherd*, whichever Hermas may have been its author, seems to have been originally written in Greek. However, until recently, it was known only by a Latin version, with the exception of some Greek fragments collected from the quotations of the work by the Greek fathers. But in the year 1856 a Greek text, said to have been found at Mt. Athos, by the since too notorious M. Simonides, was published at Leipsic, the genuineness of which is more than doubtful; and an Ethiopic version was printed in 1860 by M. Antoine d'Abbadie, the well-known Abyssinian traveler and scholar. *The Shepherd* is a mystical work, divided into three parts—the first containing four "Visions;" the second, twelve "Precepts;" and the third, ten "Similitudes." It has been described as the *Pilgrim's Progress* of the early church; and although it contains but little of positive dogmatic teaching, is a most interesting monument of the Christian life of that period.

HERMENEU'TICS (Gr. *Hermeneutes*, an interpreter), the science of interpretation, especially as applied to the Holy Scriptures. It forms a branch of the same general study with exegesis (q.v.), and indeed is often confounded with that science; but the distinction between the two branches is very marked, and is perhaps sufficiently indicated by the etymology of the names themselves. To hermeneutics properly belongs the "intepretation" of the text—that is, the *discovery* of its true meaning; the province of exegesis is the "exposition" of the meaning so discovered, and the practical office of making it intelligible to others in its various bearings, scientific, literal, doctrinal, and moral. Hence, although, as will be seen by reference to the article EXEGESIS, the laws of interpretation have many things in common with those of exposition, it may be laid down that to the especial province of hermeneutics belongs all that regards the text and interpretation of the Holy Scripture; the signification of words, the force and significance of idioms, the modification of the sense by the context, and the other details of philological and grammatical inquiry; the consideration of the character of the writer or the persons whom he addressed; of the circumstances in which he wrote, and the object to which his work was directed; the comparison of parallel passages; and other similar considerations. All these inquiries, although seemingly purely literary, are modified by the views entertained as to the text of Holy Scripture, and especially on the question of its inspiration, and the nature and degree of such inspiration.

So far, there is but little difference between Roman Catholic hermeneutists and the more strict school of Protestant critics. It is at this point that the fundamental distinction between Catholics on the one side, and Protestants of every shade on the other, may be said to begin. With the latter, the sense of the Scripture once truly ascertained from the Scripture itself, interpreted by the rules explained above, is regarded as final, and is accepted by the interpreter as the revelation intended by God. With the former, the individual judgment which is formed upon these rules, and which, as to the actual meaning of the particular passage, may possibly coincide with that of the Protestant, is still controlled, and, it may be, overruled by the authoritative interpretation of the church, as conveyed in the decrees of councils, or the dogmatical definitions of pontiffs accepted by the universal church. From this circumstance it is often inferred that in the Roman Catholic church the science of hermeneutics is a nullity, and that no freedom of interpretation is practically permitted. The Roman Catholic critic, however, maintains that he exercises, and is free to exercise, on the text of Scripture the same liberty of interpretation which the Protestant may claim; and that it is quite possible that he may arrive at precisely the same conclusions with the Protestant as to the meaning of *the scriptural text considered in itself alone*. But he differs from the Protestant in believing that the Scripture does not contain the whole of God's revelation, and, therefore, that, as one passage of scripture is modified by another, so the scriptural revelation itself may be modified by other revelations of God conveyed to us through other mediums; as, for example, that of tradition. See TRADITION. As regards the literature of hermeneutics, most of the writers named in the article EXEGESIS have dealt with both branches of the science. They are for the most part Protestant. The most remarkable modern Catholic hermeneutical writers are Hermann Goldhagen (Mainz, 1765); Seemüller's *Hermeneutica Sacra* (1779); Mayr's *Institutio Juaup. Sacri* (1789);

Jahn's *Enchiridion Hermen.* (Vienna, 1812); Arigler's *Hermeneutica Generalis* (Vienna, 1813); Unterkircher's *Hermeneutica Biblica* (1831); Ronolder, *Herm. Bibl. Principia Rationalia* (Fünf Kirchen, 1838); Schnittler, *Grundlinien der Hermeneutik* (1844); Glaire's *Hermeneutica Sacra* (1840).

HERMES, the name of a divinity more familiarly known as Mercury, the god of speech, eloquence, the sciences, traffic, theft, and herds. Under this name are comprised several mythological personages, who personified the external expression of thought, whether human or divine. The principal of these are Teti, Thoth, Theuth, or Taut, the Egyptian Hermes, the Greek god properly so called, the Phenician Taaut, the Carthaginian Sumes, the Etruscan Turms, the Chaldæan Duvanai, and the Latin Mercurius. The oldest of these was undoubtedly the Egyptian, whose worship appears as early as the 11th dynasty. Thoth was generally represented with the head of an ibis (*heb*), which was his living emblem, and expressed his name in hieroglyphs. These, according to the legends, he had invented and revealed to the monarch Thamus. Many religious books were believed to have been written by him, and all literary compositions were dedicated to him. He was scribe or clerk of the gods, and in the future state justified the good against their accusers, as he formerly had Osiris in the trial of that god and Typhon. In the contest between Osiris and Typhon, when Horus had torn off the diadem of his mother Isis, Thoth is reported to have replaced it with the head of a cow. Locally, he was lord of Sesenu, Hermopolis, the modern Eshmunin, but his worship was universal. He was a self-created, self-existent god, although some legends of later date make him the son of Chnumis, or of the Nile. In his celestial character he was identified with the moon, *aah*, and was supposed to preside over that luminary, and the souls which made it their habitation. He inscribed also the names of monarchs on the *asht* or Persea, the tree of life of the Egyptian paradise.

In the Phenician mythology, Taaut or Hermes seems derived from the Egyptian, and he was the son of Misor or Egypt, inventor of writing and the sciences; while another form of his name, Sumes, is that of the Punic Hermes of Carthage. It is, however, clear that the name of Taaut is derived from the Egyptian Tet, "word" or "speech." The tradition of Hermes has passed to the Arabs, who recognize two Hermes, one who lived 1000 years after Adam, called by the Chaldees Ouriai or Duvanai, the great master; another, surnamed Thani, doctor of the world, and liberator of men from error, a prophet and philosopher; and Trismegist, the thrice-great, who lived at Calovaz, in Chaldæa.

But the most important of all was the Greek Hermes. The various traditions which make him the son of the Egyptian Nilus, whose name was never pronounced, or the sacred Thoth, are clearly Egyptian; that which derives his origin from Ouranos, and Hemera, is probably the Phenician myth. But the principal Hermes in whom the actions of the others centered was the son of Zeus and Maia, b. on Mt. Cyllene, in Arcadia, and originally a Pelasgian divinity who presided over cattle and commerce. His birth is placed subsequent to that of Apollo. Four hours after, according to the hymn, he left his cradle, and having found a tortoise, invented the *chelys*, or lyre, using its shell as a sounding-board, and making the strings out of the entrails of a sheep. At nightfall he stole fifty of the sacred herd of Apollo from Pieria, drove them to the banks of the Alpheius, slaughtered and dressed two of them. To escape detection, he had bound his feet with branches of the myrtle and tamarisk. Apollo, missing his cattle, dragged Hermes before Zeus, at Olympus, who condemned him to restore them; but Apollo, enchanted by the sound of the newly-invented lyre, offered Hermes his cattle in exchange, gave him his whip or goad, taught him how to tend cattle, and presented him with the caduceus. In the *Iliad* and *Odyssey* are no traces of his thievish propensities, which were introduced by the later poets. In the Gigantomachia he liberated Zeus from Typhon, and restored him his limbs. Hermes was messenger, herald, and ambassador of the gods; he bound Prometheus to Caucasus; killed Argus with the hundred eyes; liberated the wandering Io, etc. In the events of the Trojan war, he conducted the goddesses to the fatal judgment of Paris, brought Priam to Achilles, and was patron of Ulysses, to whom he gave the herb molys, to liberate him from Circe. Many heroical and other personages were descended from him. As god of the sciences, he invented the alphabet from the flight of cranes, astronomy, and numbers, weights and measures, music, the lyre, and syrinx, gymnastics, tactics, and the cultivation of the olive. Many festivals were celebrated to him in northern Greece and the islands, as at Phenea, Cyllene, and Athens; and some of these Hermæa resembled the Saturnalia, slaves being served on these occasions by their masters. His worship, in fact, extended all over the Peloponnesus, the islands of the Ægean, Asia Minor, and even Hesperia or Magna Græcia. Amongst animals, the tortoise, pig, lamb, and goat, and the young of beasts, were sacred to him; the ibis and the gull (*larus*) amongst birds; and the palm-tree, black-thorn, cinque-foil, and purslane amongst plants. Hermes had a local worship in Samothrace, where he appeared as one of the Cabiri, under the name of Casmilos, the son of Hephaistos or Vulcan, and Cabira. In the Eleusinian mysteries, he was represented by the hieroceryx.

The idea of Hermes seems to have been developed from two origins—the ancient Pelasgic or Arcadian god of shepherds, subsequently considered the patron of barter, of

commerce, without any trace of intellectual qualities; and the Phenician or Egyptian Hermes, introduced by commerce into Greece, with all the attributes attributed by the Orientals to their deity. In art, a similar development is seen from the old squared trunks or pillars, called hermæ and hermidia, retained till a later period, but by degrees ornamented with a bearded head, to which sometimes are added phallic symbols, the destruction of which at Athens before the sailing of the Sicilian expedition led to a fearful tumult, and the fall of Alcibiades (q.v.). In later, but still archaic art, he is represented bearded, wearing the broad-brimmed petasus, and holding the twisted caduceus. At the time of Phidias, he was represented unbearded, with curly hair, a crafty and charming expression, and the form of an athlete. Instead of the petasus, wings are sometimes arranged in his hair; his boots are winged, and his caduceus has two snakes attached to it. His form is naked, but often has a *chlamys*, or cloak, doubled upon his shoulder, and his hand holds a purse of money; while the cock, referring to his invention of the gymnasium, or the hours of business; the tortoise, allusive of his discovery of the lyre; the palm-tree, emblem of his invention of letters; the goat, referring to his charge of herds and paternity of Pan; and even the dog, allying him with Anubis, are placed at his side. The most remarkable type of the god was as carrying a ram upon his shoulders (*criophoros*). The caduceus was gilded at the top, painted blue in the middle, and black at the handle.

The Etruscans seem to have derived his worship directly from the Greeks, and represent him with the same attributes and type, but with the Etruscan name *Turms*, as the Camillus of the gods. His worship passed into Rome, under the name of Mercurius, or Mercury, by which he is more familiarly known, supposed to be derived from *mercari*, to traffic. There was something mystic in his cult, for the *feciales* did not know his nature, and he originally had the laurel instead of the caduceus, and the name of his mother Maia had been given to the month Maius, or May, on the 15th day of which his festival was held. As early as 259 A.U.C., he had a temple near the Circus Maximus, and his statue in that locality held a purse. At the Porta Capena, there was a well sacred to him, and the merchants sprinkled themselves and their goods with the holy-water obtained by dipping a laurel branch into the well. Tradition made him the father of Evander by the nymph Carmenta, and of Larea by the goddess Lara; but the Romans adopted into their religious system the Greek traditions, although, at a later time, under the empire, the influx of foreign religions made them confound him with the Egyptian Anubis, and even represent him with a dog's or jackal's head, and depict him of a golden or black color. His worship had even penetrated to Gaul, where he was adored under the name of Teutames.—Grüber, *Altklass. Wörterbuch Voce;* Gerhard, *Griechisch. Mythol.* (8vo. Berl. 1854, i. 260; Hartung, *Rel. d. Römer* (8vo. Frib. 1843); Birch, *Gall. Antiq.*, pp. 26, 27; Müller, *Arch. d. Kunst*, p. 560.

HERMES, GEORGE, a Roman Catholic philosopher and divine of Germany, whose system has been the occasion of a long and acrimonious controversy, was b. at Dreyerwalde, in the diocese of Paderborn, in Westphalia, April 22, 1775. Having received his early education from his parish priest, Hermes entered the gymnasium of Rheina, and thence was transferred, in 1792, as a theological candidate, to the university of Münster, where he speedily distinguished himself, as well by his ability and acuteness, as by his piety and exemplary life. In 1798 he was appointed professor in the gymnasium of Münster; and after nine years, he was named professor of theology in the university of the same place. His lectures being of a popular character, and addressed mainly to the examination of the modern philosophical systems, and thus bearing on revelation, attracted many hearers, and established for Hermes a high reputation in Germany; and when, in 1819, the new mixed university of Bonn was established, Hermes was appointed to a professorship of theology. His early reputation attended him here, and students flocked to his lectures from all parts of Germany, and even from the low countries. In this office he continued until his death, which occurred May 26, 1831.

The great object which Hermes appears to have proposed to himself was to counteract the influence of the philosophical systems, which, when he entered on his career as a professor, were in the enjoyment of their full popularity, and especially that of Kant; and with this view, he sought to deduce the foundations of all philosophical inquiry from the same first principles from which the Kantian philosophy takes its departure. His system, therefore, presupposes in the mind, as the starting-point of all rational inquiry, a blank condition, which, as variously described by friends and enemies, is either simply the absence of all previous conviction, or a state of positive doubt, analogous to the so-called pyrrhonism of the ancient schools. The Hermesian method of investigation, in like manner discards, in the first stages, and so far as investigation is permitted to extend, all principle of authority; and in the details of metaphysical inquiry, in the selection of the arguments of the existence of God, and of the nature of divine attributes, he departed widely from the old text-books of the schools; although in the general sum of the doctrines of the Roman Catholic church, his orthodoxy does not appear to have been in any degree called into question. The objections which arose lay rather against his method than against its actual doctrinal results.

It is remarkable, too, that although his work, *Einleitung in die Christ-Katholische Theologie* (Introduction to Christian-Catholic Theology), was published in 1819, and again

in 1831, it was not until after Hermes's death that the controversy regarding his system took a definite form, and eventually, at the instance of Clement Augustus Droote-Vischering, archbishop of Cologne, was referred to Rome. It would be out of place here to enter into the particulars of the controversy which ensued, the chief assailant of the system being a learned Italian professor of the collegio Romano, the Jesuit, father Perrone; while its defenders were almost exclusively Germans, most of them Hermes's own friends and pupils. The controversy was a very protracted one; and a very large, although, it must be confessed, excessively dull and misty literature, has grown out of the subject. It will be enough to say, that after a protracted examination, the doctrine of Hermes was condemned by a brief, dated Sept. 26, 1835. The German partisans of Hermes, who had at their command a theological journal of considerable circulation, the *Journal of Bonn*, protested from the first against this condemnation, to which they applied, at least practically, the well-known distinction of "fact" and "right," which had been long ago employed by the Jansenists; contending, that although the doctrines contemplated by the brief were rightly condemned, as being unsound and untenable, yet no such doctrines were taught by Hermes, or contained in his book. Two of the leaders of the party, profs. Braun and Elvenich, went to Rome to urge a reconsideration of the condemnatory decree; but their mission was unavailing, and the decision was ordered to be enforced without reserve. The archbishop of Cologne accordingly insisted on unqualified submission; and the troubles which arose from the opposition which he encountered, tended much to complicate the difficulties of a conflict which arose between him and the Prussian government, as to the question of "mixed marriages," and which led eventually to his arrest and deprivation by the crown. The controversy was continued, as well in Rome as in Germany, for a considerable time; by degrees, however, the Hermesian party fell away. The professors of various universities, individually or in bodies, accepted the papal condemnation; and although some have still persevered in their resistance down to a comparatively late period, they have been almost exclusively of that extreme party, many of whom openly seceded from Rome, under the name of the German Catholic church, and whose principles go even beyond orthodox Lutheranism, and may be regarded as verging on the most advanced borders of rationalism.

HERMET'IC BOOKS. Amongst the Egyptians, all books or literary compositions appear to have been dedicated to Thoth, and notices of this nature are appended to several papyri. The earlier religious books, such as the Ritual, were supposed to have been written by the fingers or under the dictation of the god Thoth himself, and several chapters of this and other works are stated to have been found on monuments written by the god. Hence the word hermetic, taken in its most extended sense, meant inspired, as Thoth was the scribe of the gods. Various traditions prevailed as to the number and nature of these books. Clement of Alexandria mentions 42 hermetic books, which contained the sum of all knowledge, whether human or divine; while others, as Iamblichus, raise their number to 20,000; and Manetho gives the astronomical cipher of 36,525. The series of books mentioned by the great authors were: 1. Sacred hymns of Osiris; 2. On the Life of a King; 3–6. Astrological precepts and observations; 7–17. Cosmography, geography, and chorography of Egypt and the Nile; 18–27. Laws and discipline of priests; 28–33. Medicine. Portions of these books have been undoubtedly found in the hieratic papyri. Under the name of hermetic books, several writings, principally in Greek, have been handed down, which pretend to be translated from the Egyptian, and similar books may have existed in the 2d century. But these books contain notions of the Neo-Platonic school of Phorphyry and Iamblichus, and appear to be intended as philosophical works giving an explanation of the genesis of the cosmos, the nature of God and man, in antagonism to the books of the Old and New Testament, from sources partly Egyptian, partly Persian and Rabbinical, and other traditions of the Alexandrian school. The name of hermetic writings was partially affected by the alchemists and astrologers of the middle ages, as the *Tractatus Vere Aureus*, by Dominicus Gnostus, in 1610; the *Tabula Smaragdina*, or "Emerald Table of Alchemy," in 1541; and various others. The principal tenets of the hermetic books are, that the Creator made the Cosmos by his word out of fluid; that the soul is a union of light and life, and proceeded from the cosmic soul; that death and life are only changes, and that nothing is destructible; that the soul transmigrates; that passion or suffering is the result of motion.—Baumgarten-Cruzius, *de Librorum Hermeticorum Indole* (Jena, 1827); *Hermes Trismegistus*, a Scheible (12mo, Stuttg. 1855); *Hermes Trismegistus* (*Poemander*) a Parthey (8vo, Berol. 1854).

HERMIAS, a slave of Eubulus, tyrant of Atarneus, Asia Minor, and succeeded him on the throne in 347 B.C. He was a favorite of Eubulus, and was treated as a freeman, being permitted to go to Athens where he made the acquaintance of Plato and Aristotle. The latter spent some years at Hermias's court, but fled when Artaxerxes captured Hermias, who was put to death. The philosopher erected a statue in his honor and married one of his relatives.

HERMIT (Gr. *erimites*, Lat. *erimita*, an inhabitant of the desert), one of the names given in the early ages, and still more in the later church, to a class of solitary ascetics, who, with a view to more complete freedom from the cares, temptations, and business of the world, withdrew from the ordinary intercourse of life, and took up their

abode in natural caverns or rudely formed huts in deserts, forests, mountains, and other solitary places. In the first centuries, the names of eremite and anchorite (q.v.) were indiscriminately applied to these solitaries; but the word *eremita* having been adopted into Latin, it is more commonly used in the modern languages which are derived from the Latin; and the Germans use the name *einsiedler*, which is of the same signification. The hermits of the middle ages, like the primitive anchorites, often lived in complete solitude; but a much more common, and, in its influence on the church, more important form of the institute, was that of a community of hermits, each possessing his separate hermitage, but all meeting at stated times for mass, prayer, religious instruction, and other common and public exercises. The various hermits of this class are regarded as constituting religious orders, and although never attaining to the popularity which distinguished the Franciscans, the Capuchins, the Dominicans, and other active orders, they form, nevertheless, a numerous and not uninfluential element in the spiritual life of the Roman Catholic church. It is beyond the scope of this work to enumerate all the eremitical orders. The most remarkable are—the hermits of St. Augustine, who trace their origin to the holy father of that name, but are subdivided into several varieties, which had their rise in the 11th, 12th, and 13th centuries; the Camaldolese, founded by St. Romuald in 1012; the Celestines, a branch of the Franciscans, established by Peter Murrone, afterwards pope Celestine V.; the Hieronymites (q.v.), established first in Castile in the 14th c., and thence introduced into other parts of Spain and into Italy by Lope d'Olmeda in 1424; and the Paulites, so called from St. Paul, the first hermit, but an institute of the 13th c., which had its origin in Hungary, and attained to a wider extension and a greater popularity than perhaps any other among the eremitical orders. —See Helyot, *Histoire des Ordres Religieux;* also Wetser, *Kirchen Lexicon* art. *Einsiedler.*

HERMITAGE, the cell or hut of a single hermit, and sometimes the aggregate of the cells occupied by the members of a single community. Many of these, from the reputation of their inmates, or as being the scenes of certain popular miraculous legends, attained great celebrity, and became the nuclei of important ecclesiastical establishments, and, in some instances, large and populous cities.

HERMIT CRAB, the common appellation of a large family (*paguridæ*) of crustaceans, of the order *decapoda,* and sub-order *anomoura* (see CRAB), having the abdominal or tail segments much more largely developed than in true crabs, but undefended by hard plates, and not forming an organ for swimming, as in lobsters, prawns, and other *macroura.* The soft and tender tail requires a protective covering, which the instinct of the hermit crabs leads them to find in some turbinated univalve shell of suitable size. The most common British species (*pagurus bernhardus*) is an interesting object to every visitor of the sea-shore, and may be found in abundance wherever little pools are left by the tide on a rocky or shelving coast. Shells of whelks, periwinkles, etc., may be seen moving about in the pools in a manner very different from that in which they were carried by their original molluscous owners, having now become the property and habitations of hermit crabs, by which, perhaps, the mollusks were eaten. On the slightest alarm, the hermit crab retires into the shell, guarding the aperture of it with one claw, which is much larger than the other, the hard points of the feet also projecting a little. The whole structure of the animal is adapted to such a habitation. The part which in the lobster becomes a finlike expansion at the end of the tail, becomes in the hermit crab an appendage for firmly holding by the shell; and so firmly does the hermit crab hold, that it may be pulled in pieces, but cannot be pulled out. Some species have suckers to render the hold more perfect. Increase of size, however, renders it necessary for hermit crabs to relinquish their old shells and seek new ones. Hermit crabs are very interesting inmates of the aquarium, but their locomotive habits and their voracity make them unsuitable for an aquarium otherwise very finely stocked. They feed on mollusks, and on all the animal garbage of the sea-shore.—Some of the hermit crabs of warmer climates are much larger than the British species; some of them (genus *cœnobita*) inhabit land-shells, and some are found even at a distance from the sea.

HERMODAC'TYL (Gr. *hermes,* mercury, and *dactylos,* a finger) is the name of a medicine that had a high repute among the later Greek and the Arabian physicians, as a remedy for gout and rheumatism. It is mentioned by Alexander of Tralles, who flourished 560 A.D.; Paulus Ægineta, who lived a century later; Avicenna, Serapion, etc. By some of the old writers, it was termed *anima articulorum,* or *the soul of the joints.* Corms, probably of several species of colchicum, are still sold in Greece and in the east under the name of hermodactyls. While sir H. Halford and others have advocated the view that hermodactyls are the corms of *colchicum autumnale,* different botanists and pharmacologists have referred them to *C. illyricum, C. variegatum, C. bulbocodiodes,* etc. No modern experiments have been made to determine the activity of hermodactyl, and the subject is one rather of historical than of practical interest. See COLCHICUM.

HERMOGENES, of Tarsus, a Greek rhetorician, who flourished in the reign of Marcus Aurelius. His precocious ability secured him a public appointment as teacher of his art while as yet he was only a boy; but at the age of 25 his faculties gave way, and he spent the long remainder of his life in a state of intellectual impotency. In the nine or ten years, however, of his activity, he composed a whole series of treatises on rhetoric, which became popular text-books, and the subject of subsequent commentaries.

HERMON, one of the highest mountains in Syria (9,150 ft. above the Mediterranean), an outlier of the Anti-Lebanon. The Sidonians call it Sirion, and the Amorites Shenir. Some part of this mountain near Cæsarea Philippi was probably the scene of the Transfiguration. The modern name is *Jebel esh Sheikh*, or "chief mountain." It is also called Jebel eth Thelj, "snowy mountain." The ridge of Hermon, rising into a dome-shaped summit, is 20 m. long, extending n.e. and s.w. The formation is a hard, dark-gray crystalline limestone belonging to the Neocomian period, and full of fossils. The spurs consist in some cases of white chalk covering the limestone and on the s. there are several basaltic outbreaks. The mountain in spring is covered with snow, but in autumn there is occasionally none even in the ravines. To the height of 500 ft it is clothed with oaks and brush, while luxuriant vineyards abound. Above the snow limit the mountain is bare and covered with fine limestone shingles. The summit is a plateau from which three knolls rise up, that on the w. being the lowest and that on the s.e. the highest. On the s. slope of the latter are the remains of a small temple described by St. Jerome. The view from Hermon is very extensive, embracing Lebanon and the plains e. of Damascus, to the n. and e., while to the s. there is an uninterrupted view of Palestine as far as Carmel and Tabor. On a clear day even Jaffa may be seen. Several small temples are found on the sides of Hermon, of which twelve in all have been explored. They face the e. and are dated by architects about 200 A.D. Foxes, wolves, and the Syrian bear are commonly found on Hermon, with various kinds of game.

HERMOPOLIS MAGNA (now Eshmoon or Ashmounen), a city of Heptanomis, or Middle Egypt, on the Nile. Owing to its frontier position with reference to Middle and Upper Egypt, the ancient Hermopolis was a place of importance, second only to Thebes. The portico, still remaining, of a magnificent temple has attracted the notice of travelers. It consists of twelve pillars each 40 ft. high, in two rows of six to each row, painted with bands of blue, red, and yellow. These pillars are composed of irregular masses fitted together—a peculiarity of extremely rare occurrence in Egyptian architecture. The ruins of Hermopolis have been greatly destroyed by the Mohammedans, who have used them for building purposes.

HERMOSIL'LO, a city in the n.w. of Mexico, in the state of Sonora, on a river of the same name, about 60 m. e. from the Californian gulf, and 90 n. of the port of Guaymas. The town lies in a valley, 10 m. long by 4 broad. The climate is dry and very hot, but the place is nevertheless considered healthy, being free from the epidemics which often accompany very high temperatures. The valley is very fertile, and produces grapes, melons, figs, oranges, limes, lemons, citron, peaches, and pomegranates in great abundance. The vine, however, is the principal object of cultivation, not less than 1500 barrels of brandy being annually made. The town has a large trade with Guaymas, being the principal entrepot for the trade with the interior. Pop. about 18,000, including about 3,000 Yaqui Indians, who are the laborers of the town.

HERNANDO, a co. in w. Florida, on the gulf of Mexico and the Withlacoochee river; 1950 sq.m.; pop. '70, 2,938—854 colored. It is level, and largely covered with forests. The soil is sandy. Chief productions: corn, cotton, sugar, rice, etc. Co. seat, Brooksville.

HERNDON, WILLIAM LEWIS, 1813–57; b. Va.; entered the navy at 15; served in the war with Mexico, and was for several years in the naval observatory. In 1851 he conducted an exploring expedition on the Amazon at the instance of the U.S. government, starting from Lima and crossing the Andes. In 1857 he was lost at sea while commanding the steamship *Central America* on her voyage from Havana to New York. Nearly all the women and children were saved, but Herndon and 426 others were lost.

HERNIA, in its widest sense, signifies a protrusion, through an abnormal or accidental opening, of any organ from its natural cavity. Although hernia may occur in many parts of the body, the word, used by itself, is restricted to signify protrusion of the abdominal viscera.

The way in which hernia may arise will be readily understood, if we bear in mind that the abdominal viscera are subject to violent pressure from the diaphragm and other surrounding muscles. This pressure forces them outwards and downwards against the walls of the belly; and if at any point these walls are not sufficiently strong to resist this pressure, some portion of the viscera is driven through them, and a hernial tumor is formed. Certain parts of the abdominal walls, especially the inguinal and crural rings, and the umbilicus, being weaker than others, hernia most frequently occurs at these points. In some instances hernia is congenital, as from abnormal deficiency of the walls; in other cases, it may arise at any period of life as a result of violent bodily exertion. Sex, age, and occupation seem to have a marked influence in predisposing to hernia. Men are far more liable (in about the proportion of four to one) to this disease than women; though they are less so to those forms of the affection known as femoral and umbilical hernia. According to Malgaigne, in France, one man in thirteen, and one woman in fifty-two, are the subjects of hernia. In respect of age, he found that the liability is least about the age of 13 (1 in 77), after which it progressively increases until the close of life, rising at 70–75 to 1 in 3.

A hernia is almost always composed of *a sac* and *its contents*. The sac is a portion of the peritoneum (q.v.) corresponding to the aperture at which the hernia protrudes. It is pushed forward by the protruding viscera, and forms a pouch. The contents vary greatly, but generally consist of a portion of the small intestine (particularly of the

ileum), forming the variety of hernia known as *enterocele*. Omentum is often found in hernial sacs, together with intestine. Besides the viscera, the sac always contains a certain quantity of fluid secreted by its interior. Hernia is divisible (1) into *reducible*, or returnable into the abdomen, *irreducible*, and *strangulated;* and (2) according to its situation, into *inguinal*, *crural*, etc.

The treatment of reducible hernia may be palliative or radical. The palliative treatment consists in the application of a truss (q.v.) to retain the protrusion within the cavity of the abdomen. Each particular kind of hernia (femoral, crural, etc.) requires its special form of truss; and before applying it, the hernia must be reduced by placing the patient on his back, relaxing the muscles by bending the thigh upon the abdomen, and pressing the tumor back in the proper direction. The truss should then be put on, and should be worn during the whole of the day; and if the patient will submit to wear it (or a lighter one) during the night, so much the better. The means that have been contrived to effect a radical cure are too purely surgical for description in these pages. Below the age of puberty, and if the hernia is recent, a radical cure is sometimes effected by wearing the truss for two or three years.

In irreducible hernia the protruded viscera cannot be returned into the abdomen, but there is no impediment to the passage of their contents or to their circulation. In these cases, the patient is often liable to dragging pains in the abdomen, and to attacks of vomiting, in consequence of the movements of the stomach being checked by the omentum or the intestines being fixed. There is also constant danger of this hernia passing into the strangulated form. The treatment may be either palliative or radical. The palliative treatment consists in the employment of a truss with a hollow pad that shall embrace the hernia and prevent any additional protrusion. A radical cure may *sometimes* be obtained by keeping the patient in the recumbent position, and on very low diet for two or three months; at the same time keeping the bowels open by laxatives and injections, and maintaining equable pressure over the tumor.

Hernia is said to be strangulated when a portion of intestine or omentum that is protruded is so tightly constricted that it not only cannot be returned into the abdomen, but has its circulation arrested. This form is highly dangerous, because, if relief is not speedily afforded, the strangulated part becomes gangrenous. The causes of strangulation are various, but this condition most commonly arises from a sudden violent effort, by which a fresh portion of intestine is driven into a pre-existing hernia, which it distends to such a degree as to produce this complication. The most prominent early symptoms are flatulence, colicky pains, etc. They are succeeded by vomiting first of the contents of the stomach, then of mucus and bile, and lastly of fæcal matters, owing to inverted peristaltic action. If relief is not obtained, the inflammation that commences in the sac extends to the peritoneum, and the ordinary signs of peritonitis appear. After a variable time comes gangrene or mortification of the part, and the patient speedily sinks.

The surgeon first tries to return the intestine, as in the preceding cases. This manipulation, termed the taxis, may be assisted by the internal use of chloroform, inhaled till it produces complete relaxation of the muscle, by general bleeding to the verge of faintness, by the hot bath, etc. If this fails, he must have recourse to the knife to divide the constriction.

HERNÖSAND, chief t. and seat of justice of Wester Norrland, on the e. coast of Sweden, built on the island of Hernö (connected with the mainland by bridges), about 3 m. s. of the mouth of the Angerman river, and 230 m. n. of Stockholm; pop. '76, 4,912. It is the seat of a bishop, and possesses a fine church erected in 1842–46. There are engine-works, timber-yards, saw-mills, and various manufactories in the town. The harbor is good. In 1878, 33 vessels, chiefly engaged in the timber trade, with a total burden of 7,698 tons, entered and cleared at the port. Tar is also exported, and there is an establishment for pisciculture in the town. Hernösand was founded in 1584, and received its town privileges from John III. in 1587.

HE'RO, a priestess of Venus, celebrated for her love for Leander. At a festival of Venus and Adonis, held at Sestos on the Thracian coast, Hero and Leander first saw each other, and were immediately inspired with a mutual passion. Hero's position as a priestess, and the will of her parents, opposed their union. Undaunted by these obstacles, Leander every night swam across the Hellespont to visit his beloved, who directed his course by holding a burning torch from the top of a tower on the sea-shore. After many interviews, Leander was drowned in a tempestuous night, and was cast on shore at the foot of the tower where Hero anxiously awaited him. At the sight of the body, she threw herself from the tower. A poem has come down to us under the name of Musæus, in which this story is sung; Schiller likewise has made it the subject of a beautiful ballad.

HERO, or HERON, commonly known as HERO OF ALEXANDRIA, was a pupil of Ctesibius, and flourished 284–221 B.C. He was a celebrated mathematician and natural philosopher, and displayed, especially in the latter subject, a most original and inventive genius. He constructed a great number of machines and automata—rather, however, as toys than for the purpose of applying them to any useful purpose—among which are *Hero's fountain* (q.v.); a *steam-engine* on the principle of Barker's mill (a vessel being caused to revolve by jets of steam issuing from lateral holes in the arms with which

it is provided); a double forcing-pump used for a *fire-engine* (q.v.), and various other similar applications of air and steam. It is but recently that the remarkable claims of Hero to such discoveries have received any notice, for in the valuable work of M. Dutens, entitled *L'origine des Découvertes attribuées aux Modernes*, the name of Hero is not even mentioned. Among his works which have come down to us are *Pneumatika*, his most valuable work, in which the above-mentioned machines and many others are figured and described; *Belopoietika* (on the manufacture of darts) and *Cheiroballistras Kataskeuē* (also on warlike instruments); *Peri Automatopoietikōn* (on the construction of automata). All these works are merely fragments, and an acquaintance with them causes us to regard with the greater regret the loss of the rest. The best edition of his works is that published in the *Veterum Mathematicorum Opera* (Paris, 1693).

HER'OD, the name of a family which rose to power in Judea during the period which immediately preceded the complete destruction of the Jewish nationality. The family was of Idumean descent; but, though alien in blood, was Jewish in religion, the Idumeans having been conquered and converted to Judaism by John Hyrcanus, 130 B.C. The most remarkable rulers of the name are four in number—Herod the great, Herod Antipas, and Herod Agrippa I. and II. (for the last two, see AGRIPPA). 1. HEROD THE GREAT. He was the second son of Antipater, who was appointed procurator of Judea by Julius Cæsar, 47 B.C. At the time of his father's elevation, Herod, though only 15 years of age, was made governor of Galilee, and afterwards of Cœle-Syria; and finally he and his elder brother were made joint-tetrarchs of Judea; but he was soon displaced by Antigonus, the representative of the Asmonean dynasty, and forced to flee to Rome, where he obtained, through the patronage of Antony, a full recognition of his claims, together with the title of king of Judea, 40 B.C. Several years elapsed, however, before he succeeded in establishing himself in Jerusalem. On the fall of Antony, he managed to secure a continuance of favor from Augustus, from whom he not only obtained a confirmation of his title to the kingdom, but also a considerable accession of territory, 31 B.C. From this time till his death, his reign was undisturbed by foreign war; but it was stained with cruelties and atrocities of a character almost without parallel in history. Every member of the Asmonean family, and even those of his own blood, fell in succession a sacrifice to his jealous fears; and in the latter years of his life, the lightest shade of suspicion sufficed as the ground for his wholesale butcheries, which are related in detail by Josephus. Of these, the one with which we are best acquainted is the slaughter of the infants at Bethlehem. The one eminent quality by which Herod was distinguished was his love of magnificence in architecture, and the grandeur of the public works executed under his direction. Even by these, however, he alienated the Jews, who ascribed them all to his gentile leanings, and to a covert design of subverting the national religion. Herod married no fewer than ten wives, by whom he had fourteen children. He died of a loathsome disease at the age of 70, after a reign of 37 years.—2. HEROD ANTIPAS, son of Herod the great by his wife Malthace, a Samaritan, was originally designed by his father as his successor; but by the final arrangements of the will of Herod the great, Antipas was named tetrarch of Galilee and Perea. He divorced his first wife, the daughter of Aretas, king of Arabia Petrea, in order to marry Herodias, the wife of his half-brother Philip—an incestuous connection, against which John the baptist remonstrated, and was in consequence put to death. It was during a visit of Herod Antipas to Jerusalem for the purpose of celebrating the passover that our Lord, as having been a resident of his tetrarchate, was sent before him by Pilate for examination. At a later time he made a journey to Rome, in the hope of obtaining the title of king; but he not only failed in this design, but, through the intrigues of Herod Agrippa, was banished to Lugdunum (Lyon), where he died in exile.

HERO'DES ATTICUS. See ATTICUS HERODES.

HERODIAN, author of a Greek history extending from 180 to 238 A.D. It narrates the events of the 58 years that intervened between the death of Marcus Aurelius and the proclamation of Gordianus III. The narrative is of special value for the reigns of the emperors subsequent to Alexander Severus, with whom the work of Dion Cassius ends. As a historian, Herodian has prominent merits and defects. His work has the value that attaches to a record written by one chronicling the events of his own times, gifted with respectable powers of observation, indubitable candor, and independence of view. But he prefers style to truth, and is thus led into exaggerations and errors. The inner life and thought of Rome, the formidable barbarian pressure on her borders, are alike unheeded, that he may blazon his pages with the dazzling vicissitudes of the purple. Though the declamations which he introduces are apt to become tedious, his story is on the whole clear, graceful, and vivacious. The frequent antitheses and studied tricks of phrase savor of the rhetorical schools. Imitations of Thucydides and Latinisms are frequent. Yet in the main his style retains an original cast, a genuine unborrowed beauty, and contrasts favorably with the thin, affected Atticism of the period.

HERODIANS, a sect among the Jews, as to whose particular tenets there have been many opinions. Probably they were political in aim, and supported Herod Antipas in his claims to regal power. In New Testament history we generally find them opposed to the Pharisees, or hierarchical party.

HEROD'OTUS, the oldest Greek historian, and for this reason usually styled the "father of history," was b. at Halicarnassus, in Caria, 484 B.C. He appears to have early formed the resolution of writing a historical work on an extensive scale, and with this view determined to visit and observe with his own eyes the most remote countries and nations. Although the dates and extent of his travels are involved in obscurity, and sometimes even in contradictions in the ancient narratives, we gather from his own statements that in his early youth he visited the islands and coasts of Asia Minor; that subsequently he devoted particular attention to Egypt, which was at that time little known; that he next visited Palestine and Phenicia; and finally penetrated as far east as Babylon and Susa. We are also informed that he sailed through the Hellespont into the Black sea, and visited all the countries situated on its shores. After his return, he appears to have resided for a time at Athens. He speaks of having seen the *propylæa*, i.e., the entrances to the Acropolis, which were not finished till the outbreak of the Peloponnesian war (431 B.C.). He also interested himself warmly in the politics of his native city, was instrumental in delivering it from the tyranny of Lygdamis, a vassal of Persia; but being what we should call "a moderate liberal," he had the misfortune to offend the extreme or popular party, and in consequence withdrew to Thurii, in Italy, whither many of his fellow-citizens had previously proceeded. Here, in all probability, he wrote his immortal work in the decline of his life. Lucian, an indifferent authority on such a subject, states that about the year 456 B.C. he read the nine books before the Greeks assembled at the Olympic games, but this is contradicted by the numerous allusions in the history to incidents of later occurrence—for example, the revolt of the Medes against Darius Nothus (409–408 B.C.). The statement of Pliny that it was composed in his old age at Thurii is the most probable, and it best agrees with the unfinished programme of the work, and its abrupt termination, as if the author were prevented by death from finishing it as he intended. According to Suidas, he died and was buried at Thurii about 408 B.C.

The purpose of Herodotus in his history is to describe the war between the Persians and the Greeks—the struggle for supremacy between Europe and Asia, between civilization and barbarism, between freedom and despotism. Herodotus, wishing to indicate that the antipathy between the two was not the result of any accidental quarrel, but of a deep-rooted difference of character, traces it back to the mythical ages. This was the only way in which a man in his time could express what we mean when we speak of the differences of *race*. In the course of his history, he gives an account of the various countries which he had visited. Wherever he gives the results of his own observations and inquiries, he exhibits a wonderful accuracy and impartiality; and when he does not do this, he is generally careful to say so. He has been accused of credulity, and it is certain that he too readily accepted statements on the authority of others, but that he was personally a keen intelligent observer of what he saw is beyond all dispute. Herodotus wrote in the Ionic dialect, but Attic, Doric, and epic forms occur in his work. The style is marked by an easy grace and lively vigor, and everywhere there is the presence of a reverent spirit, giving a certain air of moral dignity to the entire composition. The first edition (in Latin), by Laurentius Valla, appeared at Venice in 1474; the first in the original Greek at Venice in 1502. The chief modern editions are those of Schweighauser (6 vols., Strasb. and Paris, 1806), Gaisford (4 vols., Oxford, 1824), Bähr (Leip. 1830–34), and Müller (Paris, 1844). The best school editions are those of Matthiæ (2 vols., Leip. 1825), Bekker (Berlin, 1833 and 1845), G. Long (Lond. 1830), and Negris (Edin. 1834). A variety of translations of the writings of Herodotus have likewise been published, as well as of historical and geographical treatises calculated to facilitate the study of the celebrated historian.

HEROES were, in the Homeric period, the kings, princes, generals, leaders, all brave warriors, and men who excelled in strength, courage, wisdom, and experience. Many of these had, on account of such qualities, a fabled origin, half human, half divine, and were honored, after their death, with a kind of adoration or inferior worship. These heroes and demigods were recognized as the special patrons or protectors of particular countries and cities, and to them were raised temples and altars. These examples of heroic character, held up constantly to the admiration and imitation of peoples, tended to strengthen their peculiar character, and to impress them with the greatness and glory of courage, contempt of danger, and nobility of purpose. Poetry exalted the heroic sentiment to sublimity; and poems which celebrated the deeds of heroes are themselves termed heroic. The imaginary time when heroes and other semi-divine beings lived on earth was called the HEROIC AGE. See AGES.

HEROIC VERSE. See METER, VERSE.

HEROLD, LOUIS JOSEPH FERDINAND; 1791–1833; b. France; a composer who studied with Adam and Cherubini, and successfully competed for the conservatory prizes. He spent five years in Italy, and upon his return composed several successful but ephemeral pieces for the opéra comique. *Zampa* is his best-known production. It was followed by the *Pré au Clercs*, also much admired. His health was seriously affected by the assiduity of his studies, and he died in the prime of life.

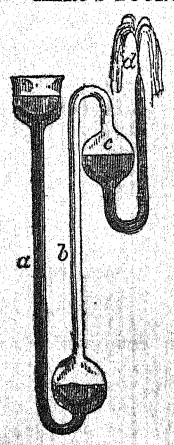
HERON, *Ardea*, a genus of birds, of the order *grallatores*, tribe *cultrirostres*, and family *ardeidæ*. This family includes also bitterns, night-herons, spoonbills, boatbills,

storks, adjutants, ibises, etc. The bill is long, compressed, and sharp; the tail short; the legs and the toes long and slender; the wings long. In the herons—in which genus are included the species commonly designated egrets (q.v.), which differ only in unimportant particulars of plumage—the bill is slender but strong, forming a compressed and lengthened cone; the plumage is beautiful, but seldom exhibits very gay colors; white, brown, black, and slate color, finely blended, being generally predominant. The body is small in proportion to the length of the neck and limbs; the neck is long, and, except in flight, is usually held curved. In flight, the heron carries the neck, head, and long bill in a straight line before the body, and the long legs in like manner stretched out behind. Herons feed mostly on fish, frogs, and other aquatic animals; and may be seen, particularly very early in the morning and late in the evening, standing patiently motionless in some shallow water, at the margin of a lake or stream, or on the sea-shore, waiting till prey come within reach. In default of their more common food, however, herons sometimes prey on young birds, reptiles, and the smaller mammalia. They usually go forth singly in quest of prey, but are mostly gregarious in their nidification. —The COMMON HERON (*A. cinerea*) is about 3 ft. in length from the point of the bill to the end of the tail. It is of a delicate gray color on the upper parts, except the quill-feathers, which are black, and the tail, which is deep slate color. The common heron generally builds its nest in a high tree, and many nests are sometimes to be seen in a single tree. Pennant tells us that he counted 80 in one oak in Lincolnshire. In very northern parts of the world, the heron is known only as a summer bird-of-passage, but it remains in Britain all the year. Its geographical range extends over most parts of Europe and Asia, and includes the north of Africa. The heron was formerly in great esteem for the table, although now disregarded; it was also the kind of game most of all pursued in falconry; and the English act, 19 Henry VII. c. 11, prohibited the killing or taking of herons, except by hawking or with the long-bow. This act was not repealed till the game act of Geo. IV.—The PURPLE HERON (*A. purpurea*) is a smaller and much rarer British species.—The GREAT WHITE HERON, or GREAT EGRET (*A. alba*), a mere accidental visitor of Britain and of the western parts of Europe, is more common in Turkey, Greece, etc., and in some parts of Asia. It is an extremely beautiful bird, with perfectly white plumage, much of it loose and flowing.—The LITTLE EGRET (*A. garzetta*) has also white flowing plumage. It is only about 2 ft. in length.—America has many species of heron, most numerous in its warmer regions. The most common species in the temperate parts of North America is the GREEN HERON (*A. virescens*), the flesh of which is so much esteemed that it is often to be seen in the markets.

Heron and egret plumes, made of the long feathers, were in former times highly valued, being, in some countries, deemed an ornament fit for royal personages or for the highest nobles.

HEROPH'ILUS, one of the greatest physicians of antiquity, was b. at Chalcedon, in Bithynia, and flourished in the 4th and 3d centuries B.C. He settled at Alexandria, and distinguished himself in particular by his devotion to anatomy. In fact, he is said to have pursued this to such an extent as to have dissected criminals alive. Several names which he gave to different parts of the body are still in use, as the "torcular herophili," the "calamus scriptorius," and the "duodenum." Herophilus placed the seat of the soul in the ventricles of the brain. Of his writings only a few fragments remain, which have been collected and published in a dissertation entitled *De Herophili Celeberrimi Medici Vita, scriptis, atque in Medicina Meritis* (Gött. 1840).

HERO'S FOUNTAIN, a pneumatic apparatus, through which a jet of water is supported by condensed air. A simple mode of constructing it by means of glass tubes and a glass-blower's lamp is shown in the annexed figure. The column of water in the tube *a* compresses the air in *b;* this presses on the surface of the water in *c*, and causes it to gush out at *d*.



HEROS'TRATUS, an Ephesian, who, from a desire of future fame, set fire to the magnificent temple of Diana, in 356 B.C. He expiated the deed by a painful death; and, by a decree of the Ionians, capital punishment was to be inflicted upon any one who should mention his name; a decree which produced an effect directly the reverse of what had been intended. The temple is said to have been set on fire on the night that Alexander the great was born.

HER'PES, a variety of disease of the skin, characterized by vesicles, sometimes as large as a split-pea, occurring in clusters on an inflamed base, and ending in desquamation, after a course of a few days or weeks. In herpes zoster, or zona, the largest and most marked variety of the disease, there is the additional peculiarity that it extends in patches around one side of the body, usually passing sharply up to the middle line, but not beyond it either before or behind. Herpes phlyctænodes, zoster, labialis, preputialis, circinatus, are the varieties of this disease most commonly met with in practice. The treatment is by soothing and cooling applications; there is no danger; but the smarting during the eruptive period, and the itching afterwards, are often very

distressing to the patient, and may be somewhat relieved by the application of cold cream and other simple soothing external applications.

HERPETOLOGY (Gr. *herpĕton*, a reptile, and *logos*, a discourse), that branch of natural history which treats of reptiles. The batrachians or amphibia having, till recently, been included by naturalists generally—as they still are by many—in the class of reptiles, the science of herpetology may be regarded as including the study of them. This branch of natural history received a share of attention from the naturalists of antiquity and the earlier naturalists of modern times. The name most deserving of notice in connection with it before the time of Linnæus is that of Ray. In the end of the 18th c. and beginning of the 19th, herpetology received special attention from Lacépède, Brongniart, Latreille, and Daudin, all of whom, as well as Cuvier, contributed greatly to its progress. More recently, it has been much advanced by the labors of Schlegel, Fitzinger, J. E. Gray, Müller, Owen, etc. The work of Spix on the *Reptiles of Brazil* is one of the most important contributions to herpetology. Bell's *History of British Reptiles* (Lond. 1839) contains a very full account of all the British species, including the batrachians. This branch of natural history derives great additional interest from the numerous fossil remains of reptiles of former geological periods, and from the great size and extraordinary characters of many of them.

HERPETOLOGY (*ante*). See BATRACHIA and REPTILES, *ante*.

HERPETON TENTACULATUS, a snake found in tropical regions which has scale-covered appendages attached to the mouth, the uses of which are at present unknown.

HERRERA, ANTONIO, one of the most eminent historians of Spain, was b. at Cuellar, in the year 1549, and died at Madrid, 1625. His principal work is the *Historia general de los Hechos de los Castellanos en las Islas y Tierra Firme del Mar Oceano*, 1492–1554 (1601–15), which was afterwards published with continuations by Andr. Gonzalez de Barcia (1728–30). His *Descripcion de las Indias occidentales* (1601 and 1615) forms an introduction to the above work. His other works are the *Historia del Mundo en el Reynado del Rey D. Felipe II.* (1601–12); *Commentarios de los Hechos de los Españoles, Franceses y Venecianos en Italia*, 1281–1559 (1624); and the *Historia de Portugal y Conquista de las Islas de los Açores*, 1582 *y* 1583 (1591).

HERRERA, FERNANDO DE, a Spanish poet, was b. at Seville in the beginning of the 16th century. When advanced in life he took orders, and died in 1589. He was master of the Greek, Roman, and Italian literatures, and was a man of prodigious learning. As a poet, he ranked so high in the opinion of his contemporaries that they bestowed upon him the appellation of the *divine*. Many of his erotic poems are remarkable for tender feeling; while his odes frequently display a lofty enthusiasm, but the expression is cast in too classical a mold, and consequently wears a certain air of artificiality. His *Obras en Verso* (1582) were republished in the *Coleccion* of Ramon Fernandez (1786; new edit. 1808). His chief historical work is the *Relacion de la Guerra de Chipre* (1572); and he translated from the Latin of Stapleton a life of Sir T. More.

HERRERA, FRANCESCO, EL VIEJO, i.e., the elder, one of the most eminent Spanish painters of the school of Seville, was b. in that city about the year 1576. His drawing was bold and spirited; for which reason he may justly be regarded as the founder of a new and more national school. His "Last Judgment" is a masterpiece of drawing and coloring; and his "Holy Family" and "Outpouring of the Holy Spirit" are also much esteemed. The cupola of the church at Sta. Bonaventura displays his skill in fresco-painting. He died at Madrid in 1656. Some of his best works are in the Louvre at Paris.—His youngest son, FRANCESCO HERRERA, EL MOZO (the younger), was born at Seville in 1622. He studied under his father, and afterwards went to Rome, where he became so celebrated for his fish-pieces that he received the surname of *Il Spagnuolo degli Pesci*. After his father's death he returned to Spain, where he painted church-pictures, domes, etc. He died at Madrid in 1685.—There have been several other artists of the same name, but of less note.

HERRICK, ROBERT, b. at London in 1591, was educated at Cambridge, and in 1629 presented to the vicarage of Dean Prior, Devonshire. Ejected from his parish by the Long parliament in 1648, he repaired to London, and published two volumes of poems, *Hesperides* and *Noble Numbers*. On the restoration of Charles II. he was reinstated in his old living, where he died in 1674. His poems, which are all lyrical, are graceful and melodious, and show much fine fancy. They vary in subject from amatory verses, sometimes indelicately expressed, to pieces of deep religious feeling. Such songs as *Cherry Ripe*, and *Gather the Rosebuds while ye may*, are universally known. The most complete edition of his works is that by the rev. A. B. Grosart (London, 1876).

HERRING (*Clupea harengus*), a fish of the malacopterous family *Clupeidæ* (q.v.); the most important to mankind of all species of fish. The genus *Clupea* is distinguished from others of the same family chiefly by the fins and by the teeth, which are small and numerous, and are situated not only on the jaws, but in other parts of the mouth, as the *vomer* (middle line of the palate) and the tongue. The herring, of which we think it unnecessary to give any description, is found in the seas of the northern parts of the world, but more abundantly in those of temperate than of arctic regions. The opinion

once entertained that its proper home is within the Arctic circle, and that its vast shoals issue thence at certain seasons, migrating southward, and spreading themselves along the British and other coasts, is now discarded as utterly without foundation; and the herring is believed to be an inhabitant of deep water, from which, at certain seasons, it approaches the shores, probably never migrating to any great distance. The young are abundant in the shallow water near the shores at seasons when the parent fish are absent. The herring seems always to deposit its spawn in comparatively shallow water, and is said to be very indifferent whether the spawning-ground be sandy, rocky, or covered with submarine vegetation. Certain localities, however, have the reputation of being favorite spawning-grounds. When the great annual shoals of herrings appear on the coasts, they generally swim near the surface of the water, and are followed by multitudes of larger fishes, as hakes, dog-fishes, etc., which prey on them; great numbers also fall a ready prey to gulls and other sea-birds, which congregate for the occasion. The food of the herring is believed to consist chiefly of minute crustaceans and *acalephæ;* but it feeds also on small fishes, not scrupling to devour even the young of its own species. Herrings are sometimes, though rarely, caught on the lines set for other fishes, and by persons angling from the shore; they are readily caught by means of a lure made of a white feather, which swims at the depth of some yards, the point of the fishing-rod being kept a yard or two below the surface of the water, the angler being in a boat which is in motion. The immense multitudes of herrings annually taken by the net cause no apparent diminution of their abundance, the destruction being compensated for by prodigious fecundity; more than 68,000 eggs have been counted in the roe of a single female. But herrings, without any apparent cause, often desert parts of the coast where for a time they have been remarkably abundant, not returning again in similar plenty till after the lapse of a number of years. Some instances of this kind, in the western parts of Scotland, were popularly ascribed to steamboats, when these first began to ply. The magnitude of the shoals of herrings is often enormous, and they have sometimes even been driven ashore in far greater quantities than the inhabitants of the neighborhood could find means of curing. An instance of this kind occurred, before the days of railways, at Crail in Fife. The water, as the tide came in, was so full of herrings, that half a dozen could be taken out at one dip of a basket. Finally, they were stranded and left by the retiring tide in such numbers, that when all the salt within reach was exhausted, the magistrates had to offer a shilling a cart for their removal as a nuisance.

There is evidence that the herring-fishery has been prosecuted in England since the beginning of the 8th c., and in Normandy since the 11th. Nor is it probable that in either case the date is that of its commencement. The prosperity of Holland is in a great measure owing to the herring-fishery, and the Dutch engaged in it with great eagerness, and carried it on even on the British coasts, at a time when it was comparatively neglected both by English and Scotch.

Another species of herring (*C. leachii*) is occasionally found on the British coasts. It is rather smaller than the common herring, and the body is much deeper in proportion to its length. It is of particularly delicate flavor. The seas of other parts of the world produce a number of other species of the genus *clupea*, as now restricted by ichthyologists. The other British *clupeidæ* are now referred to other genera.

The fishes popularly called *freshwater herrings* are *salmonidæ* of the genus *coregonus* (q.v.), to which also belong the *herring salmons* of the North American lakes and rivers. All of them are esteemed for the table.

HERRING, Vancouver Island (*Meletta cærulea*), a fish of the same family with the herring, and much resembling it both in appearance and otherwise. The genus *meletta* differs from *clupea*, to which the herring belongs, chiefly in having no teeth, except that name may be given to a rough band on the tongue. The Vancouver Island herring abounds on the north-western coast of North America. It is generally about 10 in. in length. Its color is bright steel blue, shading away on the sides to brilliant silvery white, the fins yellowish white. Immense shoals of these herrings appear on the coast at different seasons from Feb. to July; often pursued by dog-fish, so that fleeing from the enemy, they even rush upon the shore, where great numbers die among the pebbles. They afford a chief part of the sea-harvest of the Indians, who take them by various means—by the rake, such as is used by the candle-fish (q.v.), for the shoals often so fill the water that it may be employed; by hand-nets; and by long dams of lattice-work, along the outside of great mud-flats left dry by the retiring tide. The spawn of this fish is also a favorite article of food of the Indians, and is obtained by placing great quantities of fir branches in the mud over the flats, within the dams used for catching the herring. The spawn gets entangled among the branches, and is removed to be dried in the sun. Great numbers of the herring caught by the Indians are used only for the extraction of the oil. The Vancouver Island herring seems likely to acquire a great commercial importance.

HERRING, John Frederick, 1795–1865; b. England, the son of an American. The boy had a passion for painting horses, and for many years executed the portraits of the winners of races. He was a great expert in drawing other animals, fowls, etc. One of

his best known works is "Three Members of the Temperance Society," representing three horses drinking at a fountain.

HERRING-FISHERY. The herring-fishery is carried on all the year round, there being both a winter and a summer fishery; but the largest quantities of fish are caught in the months of Aug. and Sept., at which time the fishery becomes general on all parts of the British coasts.

The common mode of capturing herrings is by a set of large nets joined together, and known among fishermen as a "drift." These nets, held together by a back-rope, are let into the water in a straight line, and are kept perpendicular by a number of bladders or cork floats, balanced by a few slight weights of lead. Each single net is composed of fine twine worked into meshes of an inch square, and is 50 yds. long and 33 ft. in depth. These nets, which are now woven by machinery, were formerly made by the fishermen's families; but so many are used now, that it would be impossible to make them by hand, as each boat has a train that extends nearly a mile in length.

The herring-fishery in Scotland is regulated by acts of parliament, and watched over by the commissioners for the British fisheries. This board will allow of no other method of taking the fish than by a drift-net. Another mode of fishing, known as "trawling," but which is in reality carried on by means of a "seine"-net, prevails on some parts of the British coast; but in Scotland trawling is illegal, and subjects those who practice it to heavy penalties. The boats required in the herring-fishery in Scotland, although open or undecked, require to be of considerable size, in order to contain the large quantity of nets which are used, as well as to bring home the fish that may be taken; the fishermen also believe that the open boats are more convenient for the manipulation of the nets. Most of the boats used in Scotland are obtained from the port of Leith, which has long been celebrated for the build of its open fishing-boats. Each vessel is manned by a crew of five or six persons, one to guide the boat, and the others to maneuver the sails, nets, etc. The boat usually belongs to one person, who hires his assistants, or, as in some cases, may be owned by two or three relatives, who form themselves into a crew, and share in the proceeds of the capture. The boats of a district usually gather to a particular center, for the convenience of the curers. Some fishermen will proceed a hundred miles or more to a favorite port, and many of the curers have curing-stations at five or six different places. The boats proceed to sea so as to arrive at the place selected for casting the nets about sunset, when the sail is struck, and the nets are gently paid over the boat, which requires to be kept in motion during the process. The last portion of the nets is fixed to the boat by a long swing-rope, and when the whole train has been let into the sea, the fishermen go to rest; the boats and nets being allowed to drift with the tide. The herrings are caught by striking against the nets, in which they entangle themselves by the head. The herring-fishery partakes greatly of the nature of a lottery. A boat will sometimes obtain a large quantity of herrings, and as frequently take only a few; sometimes the nets are shot twice in a night, if no fish are got on the first trial.

The commerce carried on in herrings is peculiar. The fish when brought on shore are measured ungutted by the "cran," a vessel which contains 45 gallons, and handed over to the curer. A very large proportion of the herrings taken on the British coast are pickled or cured by means of salt; owing to the facilities for speedy transport afforded by railways, however, great quantities are also disposed of fresh. At Yarmouth, and some other parts of England, and also at some places in Scotland, the herrings are, after being slightly salted, made into what are called "bloaters," by means of smoking. A large portion of the total catch is likewise made into "reds" by a more complete smoking, and both kinds are in great demand. Smoking-houses are now numerous in many parts of Scotland.

The chief buyers of the fresh fish are known as curers; they provide salt, barrels, and labor for the curing and packing of the fish. The curer, who is usually a person of considerable capital, contracts with the owners of the boats for a certain quantity of fish, usually 200 crans, for which he pays at a rate which has been arranged for long before the commencement of the fishery. In addition to a specified price per cran, a sum of money is usually paid down by way of bounty, and various privileges, such as dye-stuffs and drying-ground for nets, a few gallons of whisky, etc., are agreed for as well. Some curers will have as many as 250 boats fishing for them on various parts of the coast. The herrings are cured (in Scotland) under the inspection of an officer, and each barrel, if cured according to the instructions laid down by the fishery board, is entitled, on the payment of a small fee, to be marked with the government brand, as a mark of its quality. A large number of women are employed to gut and pack the fish, which they do with astonishing dexterity. The excitement and bustle at a large fishing-port during the herring season are remarkable, large numbers of people being employed in the various industries incidental to the capture and cure of the herrings. Amsterdam is said to have been built on herring-bones; but the Dutch herring-fishery, once of great magnitude, has been exceeded by that of Scotland, which is the largest in the world, and from which cured herrings are exported to the continent of Europe and to Ireland, and other countries, in large quantities. The only official statistics of the herring-fishery in Great Britain relate to the fishery in Scotland

and the Isle of Man; these are issued annually by the commissioners of the British fisheries. No account is kept of the quantity of herrings caught on the English coast, nor is there any authentic statistics of the number or value of the boats engaged in this branch of the fishery.

From the report of the Scottish fishery board for 1876, it appears that, in that year, there were 90,713 persons and 14,547 boats (of which, with nets, etc., the value was £1,127,994) employed in the Scottish herring and other fisheries. The total quantity of herrings cured in this year, which was the most unproductive since 1859, was only 598,197; whereas in 1875, 942,980 barrels were cured. In 1877 again the number of barrels was 847,718. The Irish reports give no such statistics, and details of the English herring-fishery cannot be separated from those of other branches of the fishery business.

Herring-fisheries have always been the subject of legislative protection in the United Kingdom, being considered a valuable branch of public industry. In 1860 an act of parliament, 23 and 24 Vict. c. 92, passed to regulate the Scotch herring-fisheries. By that act, the commissioners of the British white-herring fishery may appoint a close season in some parts of the Scotch coast, there being a close season also fixed from Jan. to May inclusive, as to the principal parts of the coast. The kind of fishing-boats and nets employed in the fishery is subjected to regulation. A penalty is incurred by selling fresh herrings during close time, 24 and 25 Vict. c. 72. The following are the more recent acts for the encouragement and regulation of the British white-herring fishery: 48 Geo. III. c. 110, 51 Geo. III. c. 101, 52 Geo. III. c. 153, 54 Geo. III. c. 102, 55 Geo. III. c. 94, 1 Geo. IV. c. 103, 1 and 2 Geo. IV. c. 79, 5 Geo. IV. c. 64, 7 Geo. IV. c. 34, 1 Will. IV. c. 54, 6 and 7 Vict. c. 79, 10 and 11 Vict. c. 91, 14 and 15 Vict. c. 26, 23 and 24 Vict. c. 92, 24 and 25 Vict. c. 72, 37 and 38 Vict. c. 25. See FISHERIES.

HERRING FISHERY (*ante*) in America is an industry of great importance, rivaled in value only by the cod and seal fisheries. From seven and a half to ten millions of pounds, valued at from $200,000 to $300,000, are brought into market in the United States, besides immense quantities consumed while fresh. The chief fishing port is Gloucester, Mass., although other ports do a large business. The vessels go northward to the coast of Maine, Nova Scotia, New Brunswick, the Magdalen island, Newfoundland, and Labrador, in spring and early winter. In winter the fish are frozen and sent in that condition to market. This fishery is of great importance to the Eastern states and the Dominion of Canada, and the herring as well as the cod was among the subjects that brought about the British-American fishery commission of 1877.

HERRING SILVER, a composition in money, in lieu of supplying a religious house with a certain number of herrings.

HERRISON (Fr. *hérisson*), in heraldry, the hedgehog, a charge allusively borne by families of the name of Harris.

HERRNHUT, a small t. in the circle of Bautzen, kingdom of Saxony, about 50 m. e. of Dresden. It is pleasantly situated on the southern slope of the Hutberg, from which it takes its name, and is noted throughout Germany for its fine and durable manufactures, particularly linen, japanned wares, and leather. Herrnhut is also remarkable for the regularity and simplicity of its architecture, and the inhabitants for their cleanliness, freedom from all ostentation, and quiet deportment. Pop. about 1200. Herrnhut was founded in 1722 by a colony of persecuted Moravians, some of whom were descended from the old Bohemian and Moravian brethren. On coming into Saxony they were sheltered and protected by the pious count Zinzendorf, to whom Herrnhut belonged. From this place the united brethren, better known as Moravians, have spread themselves over all parts of the world.

HERRON, FRANCIS JAY, b. Penn. 1837; graduated at the Western university; entered the union army as captain in 1861, and was engaged in several battles, and seriously wounded at Pea Ridge. In May he received the surrender of the confederate forces west of the Mississippi. In 1872 he was secretary of the state of Louisiana.

HERSCHEL, CAROLINE LUCRETIA, sister of the astronomer, sir William Herschel (q.v.), b. Mar., 1750, lived in Hanover till 1772, when she came to England to live with her brother at Bath. When William turned astronomer, she became his constant helper; and on his being appointed private astronomer to George III., she acted as his assistant, doing all the duties of an assistant astronomer, and in that character receiving a small salary from the king. While discharging her duties in this position, she found time for a series of independent observations with a small Newtonian telescope, made for her by her brother. Her special business was to sweep the heavens for comets, seven of which she discovered, in regard to five of which she has the credit of priority of discovery; and several remarkable nebulæ and clusters of stars included in William's catalogues were described from her original observations. In 1798 she published, with an introduction by her brother, *A Catalogue of Stars taken from Mr. Flamsteed's Observations*, etc. This valuable work was published at the expense of the royal society, and contained 561 stars omitted in the British catalogue. She lived with her brother during the whole of his career, sharing his labors and distinctions, and on his death returned to her native country. She was then 72 years of age, but she lived to be 98, retaining all

her faculties to the last. In her last days, she was not idle. In 1828 the royal society conferred on her their gold medal for completing the catalogue of nebulæ and clusters of stars observed by her brother. She was afterwards chosen an honorary member of the royal society. Miss Herschel died in 1848, after an uncommonly long and useful life. See her *Memoir and Correspondence* (1876).

HERSCHEL, Sir JOHN FREDERICK WILLIAM, BART., only son of the astronomer, sir William Herschel (q.v.), b. at Slough, 1792, educated at St. John's, Cambridge, where, in 1813, he became senior wrangler and first Smith's prizeman. His first publication was *A Collection of Examples of the Application of the Calculus of Finite Differences* (1820). In 1822 he applied himself especially to astronomy, using his father's methods and instruments in observing the heavens. For a time he worked with sir James South in re-examining the nebulæ and clusters of stars described in his father's catalogues. The results of the re-examination were given in 1833 to the royal society in the form of a catalogue of stars in order of their right ascension. The catalogue contained observations on 525 nebulæ and clusters of stars not noticed by his father, and on a great number of double stars—in all between 3,000 and 4,000. This important contribution to science led to his being acknowledged as the worthy successor of his father; so early, indeed, as 1826, the royal society had voted to him and South a gold medal apiece for their observations on double stars; but by 1833 his pre-eminence was beyond the necessity of being marked by acknowledgments. His "Treatise on Sound" had appeared in the *Ency. Metro.* in 1830, and his "Treatise on the Theory of Light" (in the same work) in 1831, in which year also appeared in Lardner's *Cyclo.* his well-known "Preliminary Discourse on the Study of Natural Philosophy"—not to mention his papers in the *Trans. Astron. Soc.* The Preliminary Discourse—one of the most charmingly written books on science in any language—contributed largely to his popularity. In 1836 appeared his "Treatise on Astronomy" in Lardner's *Cyclo.* At this time Herschel was at the cape of Good Hope, where he arrived in Jan., 1834, with the intention of completing the survey of the sidereal heavens, by examining the southern hemisphere as he had done the northern. Here he established his observatory at a place called Feldhausen, 6 m. from Table bay. On Mar. 5, 1834, he commenced his observations; and in four years, working all the time at his own expense, he completed them. The public interest taken in his labors was, as might be supposed, very great; but though now and then gratified by partial statements of his results, it was not till 1847, nine years after his return from the cape, that it received full gratification in the publication of a volume of *Results of Astronomical Observations made during* 1834–38 *at the Cape of Good Hope; being the Completion of a Telescopic Survey of the whole Surface of the Visible Heavens, commenced in* 1825. It need not be said that the results of these labors are invaluable. They are now incorporated into all books on astronomy. Herschel, when at the cape, gave an impulse to the science of meteorology, having the merit of having suggested the scheme for taking meteorological observations simultaneously at different places. In 1844 he published, under official military authority, a book of instructions for taking and recording such observations in southern Africa.

On his return to England in 1838, honors were showered on him. He had got the royal society's gold medal in 1836: he now was made a D.C.L. of Oxford; on queen Victoria's coronation, he was created a baronet; he now succeeded the duke of Sussex as president of the royal society; in 1848 he became president of the royal astronomical society. In 1849 he published his *Outlines of Astronomy.* In 1850 he was appointed master of the mint. This office, on account of ill health, he resigned in 1855. Herschel died May 11, 1871, and after his death appeared his *Catalogue of* 10,300 *Multiple and Double Stars.*

HERSCHEL, Sir WILLIAM, b. at Hanover, Nov. 15, 1738, was the son of a musician and was educated specially as a professional musician. In 1757 he went to England, where he became a teacher of music in the town of Leeds, from which he went to Halifax as organist, and subsequently (1766) in the same capacity to Bath. Here he would seem to have first turned his attention to astronomy. Wanting a telescope, and unable to afford a reflector, he made one for himself—a Newtonian, of 5 ft. focal length, and with this applied himself to study the heavens. In 1781, he made his first discovery (*Philos. Trans.* 1780–81), being a new planet, which at first he took for a comet. It was detected by an exhaustive process of surveying the heavens, which Herschel was the first to follow, taking the stars in regular series, and examining them all in their groups through the same instrument. The result of his discovery was his appointment to be private astronomer to George III., with a salary of £400 a year. He then went to live at Slough, near Windsor, where, assisted by his sister Caroline (q.v.), he continued his researches. Herschel married a Mrs. Mary Pitt, and left one son, John (q.v.). Little is known of his private life. He was knighted by George III., and made a D.C.L. by the university of Oxford; he became rich partly through his wife's jointure, and partly through selling mirrors for reflecting telescopes. He died at Slough, Aug. 23, 1822.

Herschel contributed 69 papers to the *Philos. Trans.* between the years 1780 and 1815; and to the 1st vol. of *Mem. of Astron. Society,* he contributed a paper, "On the Places of 145 New Double Stars." He greatly added to our knowledge of the solar

system: he discovered Uranus and its six satellites, and two satellites of Saturn. Besides this, he detected the rotation of Saturn's ring, the period of rotation of Saturn itself and that of Venus, the existence of the motions of binary stars, the first revelation of systems besides our own. He threw new light on the Milky Way and the constitution of nebulæ, and, in fact, was the first to give to the human mind any conception of the immensity of the universe. His catalogue of double stars, nebulæ, etc., and tables of the comparative brightness of stars, and his researches in regard to light and heat, would of themselves entitle him to the first rank as an astronomer and natural philosopher. For a notice of Herschel's telescope, see TELESCOPES. He erected one monster telescope, as it was then considered, of 40 ft. length. It was begun 1785 and finished 1789, on Aug. 28, of which year he by means of it detected the sixth satellite of Saturn.

HERSE, or HEARSE (Fr. *herse*, a harrow; hence a frame for setting candles in), had originally quite a different meaning from that in which it is now used. The term was applied to a bar or framework with upright spikes for the reception of candles, and was used at the ceremonies of the church and at funeral services. It was originally very simple in form, but in the 15th and 16th centuries herses of great splendor came into use, and were erected in the churches over the bodies of distinguished personages. The framework was of iron or brass, sometimes of beautiful workmanship, square, octagonal, etc., in plan, with pillars at the angles, and arched framework above forming a canopy. The whole was hung over with rich cloths and embroidery, and lighted up with hundreds of wax candles, and decorated with wax images. From this the transition to the modern funeral hearse (see FUNERAL RITES) can be easily traced. In Catholic churches of the present day, the hearse still exists as a triangle with spikes, on which candles are placed.

HERSFELD, an old t. of Hesse-Nassau, northern Germany, situated on the left bank of the river Fulda, which here becomes navigable, 32 m. s.s.e. from the city of Cassel. The cathedral, built in the beginning of the 12th c., on the site of an older cathedral that had been destroyed by fire, was itself set fire to by the French in 1761. Its remains form a picturesque ruin. Pop. '71, 6,434, who carry on extensive manufactures of woolen cloth and serge.

HERSHIP, an old Scotch law term, denoting the offense of carrying off cattle by force.

HERTFORD, a co. in n.e. North Carolina on the Virginia border and the Chowan river; 320 sq.m.; pop. '70, 9,273—4,952 colored. The surface is hilly, and much of it is covered with forests. Chief productions: cotton, corn, and pork. Co. seat, Winton.

HERTFORD, a parliamentary and municipal borough, market-town, and capital of the county of the same name, is situated on the Lea, 26 m. n. of London by rail. It contains few buildings of any architectural importance, but there is a branch of Christ's hospital, a grammar-school, and several charity schools. Hertford carries on no manufactures; there are, however, linseed-cake mills and several malting and corn-mills in the town and vicinity. There are here a fairly attended corn-market on Saturdays, and three annual fairs. The town returns one member to parliament. Pop. '71, 7,894.

The old castle of Hertford (scarcely a fragment of which now remains) was built about 905. It was strengthened and repaired about the Conquest. The present castle is of the time of James I.; and in the early part of the century, it was used as a college for the students of the East India company's civil service. It now belongs to the marquis of Salisbury, and is a private residence.

HERTFORDSHIRE, or HERTS, an inland county of England, is bounded on the e. by Essex, on the s. by Middlesex, on the w. by Buckingham and Bedford, and on the n. by Cambridge. Area, 391,141; pop. '71, 192,226. The surface presents a pleasing succession of finely wooded hill and fertile valley. The chief elevations are those of the chalk downs, a branch of the Chiltern hills, which skirt the n. of the county. The principal rivers are the Lea and the Colne, both affluents of the Thames. Chalk, at a greater or less depth below the surface, forms the basis of the soil, which is various, much of it being, however, a mixture of gravel and loam, with a tract of rich loam on the borders of Essex. Climate, mild and healthy. The agriculture of the county has improved very much of late years. Immense quantities of hay and straw are sold off the land, and sent to London. Throughout the county there are numerous gardens and orchards, the fruit of which is sent to the London market. Great quantities of malt are made in the county. Ware is the chief seat of the malting trade in the kingdom. Paper and straw-plait are extensively manufactured in the w. and south. Three members are returned for the county.

HERTHA, HERTHUS or ÆRTHA, a deity of the ancient Germans. Her name is doubtless the root of the modern English *earth*, and the German *erde*. Tacitus states that she was worshiped with great solemnity by the Suevi, and that her temple stood in an island of the ocean, where her service was performed by a single priest. On great occasions which were regulated by this priest, the covered chariot of the goddess was drawn forth from the sanctuary by sacred cows and led in triumph throughout the country. Those districts through which the chariot passed were held to be peculiarly favored;

peace was always proclaimed, and the occasion celebrated by universal merry-making, until the priest declared that it was the will of the goddess to return to her shrine. Her image was then washed in a sacred spring, and all who witnessed the ceremony of the ablution were drowned. The island of Rugen was long thought to be identical with the sacred island of Hertha, but the same honor has been claimed for Heligoland and Zetland.

HERTOGENBOSCH, or HERZOGENBOSCH. See BOIS-LE-DUC.

HERTZ, HENRIK, one of the most distinguished of the Danish poets, was b. in Copenhagen in 1798, of Jewish parents. In 1832 he abjured Judaism, and joined the Protestant church. His first appearance as an author was in 1827, when he produced several clever vaudevilles and comedies, as *Kjerlighed og Politi, Hr Burchardt og hans Familje, Flyttedagen*, etc., while three years later, appeared his *Gjengangerbreve eller poetiske Epistler fra Paradis*, which exhibited such wonderful powers of imitating the style and spirit of other writers, more especially those of his countryman Baggesen, that public attention was at once arrested. Hitherto he had written anonymously, but the masterly manner in which he had stigmatized the affectations and puerilities which had perverted the literature and criticism of the Danish press, produced a perfect ferment in the literary circles of Copenhagen, which led before long to the discovery of the unknown writer. From this time his works followed one another in rapid succession; and striking out in an entirely different path from the one on which he had first entered, he produced, in 1837, a dramatic poem, *Svend Dyring's Huus*, founded on an old heroic saga, which his countrymen deem his masterpiece; among Germans, however, his lyrical drama of *Kong René's Datter* (1854) is his most popular work. He died Feb. 25, 1870.

HERULI, ÆRULI, or ERULI, a nomadic and warlike German tribe, who inhabited the n. shores of the Black sea, but afterwards divided into sections and wandered into different parts of Europe. They first appear in history in the 3d c., as taking part with the Goths in their excursions against the eastern provinces of the Roman empire. In the 4th c. they acknowledged the supremacy of the Gothic king Ermanric, but when Attila, king of the Huns, made his descent upon Gaul, they joined his standard. After the overthrow of the Huns, in which they suffered considerably, they established an organized and distinct confederacy on the banks of the Danube, and under the leadership of Odoacer, assisted in 476 in the overthrow of the Western empire. Under their king Rudolph they, in the beginning of the 6th c., attempted the subjugation of the Longobardi, but were defeated and dispersed, some of them proceeding to Scandinavia, and others being allowed by the emperor Anastasius to settle on the s. bank of the Danube. In the time of Justinian some of them embraced Christianity. A large portion of them afterwards joined the Gepidæ in their wars against the Eastern empire; but others fought with Justinian against the Vandals and East Goths. Towards the end of the 6th c. they became merged in other nations, and disappear from historical records. The Heruli were bold, hardy, and extremely pugnacious. For a considerable period they retained their strong individuality, and presented a firm resistance to the influences of surrounding civilizations. They are said to have offered human sacrifices.

HERVÉ (name assumed by Florimond Rouger), b. France, 1825; widely known as a composer of operatic music. *Don Quixote*, the first opera bouffe on the Parisian stage, was produced in 1847. Among his productions are *The Turks, Little Faust, Chilperic*, etc.

HERVEY, JAMES, 1714–58; b. England; educated at Northampton grammar school and Oxford university, where he came under the influence of John Wesley, and for some time manifested an inclination towards his theological opinions; but ultimately he adopted a thoroughly Calvinistic creed, and resolved to retain his connection with the established church. Having taken holy orders in 1737 he became curate to his father, and succeeded him in 1752. Laboring under the disadvantage of very weak health, he discharged his parochial duties conscientiously, and wrote works which, while of slight literary or theological value, rapidly became popular, and in many English and Scottish houses, especially of the humbler class, ranked with the *Pilgrim's Progress* and the *Whole Duty of Man*. His earliest work, *Meditations and Contemplations*, comprising *Meditations Among the Tombs, Reflections in a Flower Garden*, a *Descant on Creation*, and *Contemplation on the Night and Starry Heavens*, passed through 14 editions in as many years. *Theron and Aspasio*, which was equally well received, called forth some adverse criticism, even from the Calvinists, on account of tendencies which were considered to lead to Antinomianism, and was strongly objected to by Wesley.* It was influential in spreading in England the theological disputes to which Fisher's *Marrow of Modern Divinity* had given rise in Scotland, led to what is known as the Sandemanian controversy as to the nature of saving faith.

HERVEY, JOHN, Baron Hervey of Ickworth, 1696–1743; the *Narcissus, Sporus*, and *Lord Fanny*, in Pope's satires, a nobleman of political and social distinction in the reign of George II., son of John, first earl of Bristol. Educated and trained for public life at Westminster and Clare Hall, Cambridge, he became a favorite at the court of the prince and princess (afterwards George II. and queen Caroline), to which Pope, Gay, Arbuthnot, Chesterfield, and other wits resorted, and which was celebrated for the beauty and

accomplishments of its ladies. Hervey married Miss Lepell 1720. Having entered the house of commons as member for Bury, he was made vice-chamberlain to the king in 1730, and in 1733 sir Robert Walpole called him up to the house of lords, where he proved an effective speaker. In 1740 he succeeded lord Godolphin as lord privy seal, which office he held until the Walpole administration was driven from power, 1742. Nothwithstanding his miserable health he continued to take an active part in politics until his death. He was survived by his four sons, three of whom were successively earls of Bristol. Destitute of any commanding talents or solid principle, a skeptic in religion, and a profligate in morals, lord Hervey was yet far above the intellectual rank assigned him by Pope. He was a vigorous writer and speaker, a fair scholar, and the author of some pleasing verses.

HERWARTH VON BITTENFELD, KARL EBERHARD, b. Saxony, 1796; began his military life in 1811, and served in the field against Napoleon in 1814. He rose by successive grades, to be gen. of infantry. In 1864 he commanded the Prussian troops against Denmark, and June 29 captured the island of Alsen. In 1865 he commanded the 8th army corps; the following year he was appointed commander-in-chief of the army of the Elbe, and was conspicuous in several engagements. During the Franco-German war he was governor-general on the Rhine. He retired from service in 1871.

HERZ, HENRI, a pianist and composer for the pianoforte. He was born of Jewish parentage, at Vienna, in 1806, and educated principally in Paris, where his talent was early recognized; and his compositions became popular over Europe. He was received with great applause on visiting England in 1834, and America in 1846. In 1837 he received the decoration of the legion of honor; and in 1843 he became professor of music at the conservatoire. In 1865 he published in the *Moniteur, Mes Voyages en Amérique*. He also carries on the business of a piano manufacturer. Herz's music is characterized by elegance and a certain originality, and holds an important place among works written for the pianoforte.

HERZ, HENRIETTE, 1764–1847; b. Berlin; the daughter of a physician, who at 16 became the wife of Markus Herz, a rich and elderly citizen, and by reason of her rare beauty and superior intellectual attainments soon became a social leader. Schleirmacher and the Humboldts were among her intimate friends. She was left a widow in 1803, but maintained her position in society and kept up her relations to literary people during her whole life.

HER'ZEGOVI'NA is the name of a province of the Turkish empire, now occupied by Austria, lying between Bosnia, Montenegro, and Dalmatia. Under the Venetians, the Herzegovina was called the dukedom of St. Saba; at a later period, it went under the name of the county of Chulm; and in 1326 was again raised to the rank of a dukedom by the emperor Frederick III. As early as 1466, the Herzegovina fell into the hands of the Turks, remaining for more than two centuries afterwards the battle-field between Christians and Mohammedans. By the treaty of Carlowitz (1697), the Herzegovina was definitely annexed to the Turkish empire, with the exception of the town Castelnuovo and its outskirts, which up to this day belong to Austria. In the early history of Hungary, the Herzegovina plays a prominent part, as Bosnia and Bulgaria were long subject to the Hungarian crown. Its physical aspect, as also its political and ethnographical character, coincide with those of Bosnia (q.v.). In 1875 a serious insurrection, arising from the Turkish oppression of its Christian inhabitants, broke out in the Herzegovina, which rapidly spread into other semi-Christian provinces, and was supported by Montenegro and Servia. This ultimately led to the war of 1877–78 between Russia and Turkey; and the treaty concluded at the end of the war provided for introducing into Herzegovina, which during the troubles had been made a separate province, a measure of local autonomy. The Berlin congress in 1878 determined that Herzegovina, like Bosnia, should be occupied by Austria.

HERZEN, ALEXANDER, a Russian author, was b. at Moscow in 1816. In 1835, while yet a student, he was imprisoned for his political opinions, and banished. After 1842 he was permitted to reside at Moscow, under the strict surveillance of the police, and for some years devoted himself exclusively to literary labors. After 1847 he resided for some time in London. In his own country, Herzen's life was one long petty persecution. Herzen's literary performances are *Dilettantism in Science* (1842), *Letters on the Study of Nature* (1845–46), *Whose Fault is it ?* and *Doctor Kroupof* (both in 1847), *Recollections of My Travels* (1848), *On the Development of Revolutionary Ideas in Russia* (1851), *Baptized Property* (1853), or "Serfism," *Prison and Exile* (1854), *My Exile* (1855), *Interrupted Tales* (1856), *France or England* (1858), *Memoirs of Catherine II.* (1859), *The Old World and Russia, The New Phase of Russian Literature* (1864). In 1865 he took up his residence at Geneva, where he continued to publish the *Kolokol*, a Russian newspaper he had started while in London; but as he sided with the Poles in their last rising, the journal lost its popularity, and was given up. He died in 1870.

HE'SIOD, next to Homer the earliest Greek poet of whom we have any knowledge, was born probably in the 8th c. B.C., at Ascra, in Bœotia, whither his father had emigrated from the Æolian Kyme, in Asia Minor. He seems to have been at first a peasant or herdsman in quite humble circumstances—in his *Works and Days*, he speaks of him-

self as *átimētes*, "unhonored," "noteless." He afterwards left Ascra, and went n. to Orchomenos, on lake Copais, where he dwelt during the remainder of his life, and where in later times his tomb was shown. This is really all we know about Hesiod, for the marvelous stories of the Neo-Platonists afford us no intelligible clue to his personal history; and in the opinion of some critics, even throw grave doubts on his historical reality altogether. This, however, is probably too extreme a view. But while it may not be necessary to reject the personality of Hesiod, it may still be allowed that he was a "representative man," the founder and head of a school of poets—the Bœotian or Pierian—who stand in striking contrast with the older Ionic or Homeric school. Their original region was at the foot of Mt. Helicon, whence they spread over Bœotia, Phocis, and Eubœa. Their language and versification were nearly the same as those of the Homeric school, but in all other respects they appear to have been different, and even antagonistic, ignoring the sanguinary struggles of the heroic age, and preferring to sing of rural quietude and peaceful pursuits, the simple sanctities of household life, the homely duties of thrift, the education of children, and the prosaic details of commerce and politics. Hence the Spartan, Cleomenes, scornfully termed Hesiod the "poet of helots," while Homer was the poet of warriors. In fine, it may be said that the poetry of the Hesiodic school indicates an advance in civilization, morality, and thought, on the Homeric school.—The works either written by or ascribed to Hesiod are seven in number, of which the following are the more important: 1. *Erga kai Hemerai* ("Works and Days"), in the time of Pausanias, the only one considered to be truly Hesiod's by the people about Mt. Helicon; 2. *Theogonia* ("Generation of the Gods"), not considered genuine by Hesiod's countrymen, nor by most modern critics; 3. *Eoiai* or *Eoiai Megalai*, called also *Katalogoi Gunaikōn* ("Catalogues of Women"). Of these the first two are entire; while the well-known *Aspis Herakleos* ("Shield of Hercules") is supposed by some to be a relic of the third. The Hesiodic poetry was, in ancient times, if not warmly admired, at least held in great veneration. Both the priesthood and the philosophers considered the *Theogony* a great, in fact, the greatest authority, on the subjects of which it discourses, and almost all the great Alexandrine critics earnestly devoted themselves to its elucidation, but their commentaries have unhappily perished. Only here and there among the *Scholia* of the later Neo-Platonists some of their remarks are preserved. The most complete collection of these is to be found in Gaisford's *Poetæ Græci Minores*. The first edition of the Hesiodic poems appeared at Milan in 1493; subsequent editions are those of Heinsius (Amsterdam, 1667), of Robinson (Oxford, 1737), of Loesner (Leips. 1778), Gaisford, Göttling (1831), Schömann (1869), Köchly (1870), and Flach (1874).

HESPERIDES, the name of the famous sisters who, assisted by the dragon Ladon, guarded the golden apples which Hera had received, on her marriage with Zeus, from Ge. Their genealogy, as well as their number, are variously given by mythologists. The locality of the gardens was also a matter of controversy, the two favorite opinions placing them westward of Mt. Atlas, and n. of the Caucasus. The apples were stolen by Hercules (q.v.), but were afterwards restored by Athena.

HESSE (Ger. *Hessen*), a territory of Germany, occupied, in ancient times, by the *Catti* or *Chatti*, who first became known to the Romans in the year 15 A.D., when Germanicus destroyed their principal settlement of Mattium, the site of the present villages of Gross and Klein Maden, near Gudensberg. In the course of time, the Catti, who were settled in the districts now known as Upper and Lower Hesse, gradually merged in the Frankish tribes, with whom they took part in the great emigration into Belgium and Gaul, after which the territories which they had evacuated were occupied by Saxons, who thenceforward kept possession of the land known in after-ages as Saxon Hesse. The power of the chiefs had, in the meanwhile, become so firmly established under the Frankish empire, that on the fall of the Carlovingians, in 911, Conrad I. duke of Franconia and Hesse, was elected to the vacant throne of Germany, as being the most powerful of the princes of the empire. The various branches of the Hessian family still extant are descended from Heinrich I., surnamed the Child (died 1306), son of Sophie, duchess of Brabant. Although he himself exercised little real power, owing to the dismemberment of Hesse into numerous semi-independent principalities, his descendants gradually reunited these disjointed domains, and added many valuable territories on the Rhine to their old patrimony. Philip I., the magnanimous, who succeeded his father, Wilhelm II., as a minor, in 1509, introduced the reformation into Hesse, and founded the university of Marburg, with the revenues of the secularized convents and monasteries. This prince took an active part in the peasant and religious civil wars of his day; and by a will made in 1562, divided his territories among his four sons, who succeeded to their allotted possessions on his death in 1567. The eldest, Wilhelm IV., obtained the half of the Hessian domains, with Cassel for his residence; Ludwig, a fourth part, with Marburg; Philip, an eighth part, with Rheinfels; and George, an eighth part, with Darmstadt. The death of Philip and Ludwig left all the Hessian dominions in the two main lines of Hesse-Cassel and Hesse-Darmstadt (q.v.).

HESSE, ADOLPH FRIEDRICH, 1809–63; b. Germany; was the son of an organ maker. When but 9 years old, Adolph played so well on the organ as to astonish all who heard him, and in 1827 he was appointed assistant player in a church in Breslau, and in

1838–29 traveled over Germany giving concerts. He left about 80 compositions, including an oratorio, symphonies, and overtures.

HESSE-CAS'SEL, or ELECTORAL HESSE (Ger. *Hessen-Kassel*), was formerly an electorate of the Germanic confederation, consisting of one large and five smaller districts, including the countship of Schaumburg and Schmalkald, a part of Henneberg and Barchfeld, with various townships, impacted within the territories of other states. In consequence of the occurrences of 1866, it was annexed to Prussia on Sept. 16 of that year, and subsequently (Dec., 1868) went to form a part of the new province of Hesse-Nassau, which embraces, besides Hesse-Cassel, the greater part of Nassau (q.v.), part of Hesse-Homburg, and the Frankfort territory, being divided into the following two disrticts:

Districts.	Area in Sq. Miles.	Total Pop. in 1875.	Chief Towns.	Pop. 1875.
Cassel	3880	788,886	Cassel	56,745
			Hanau	22,409
			Fulda	10,749
Wiesbaden	2125	679,012	Wiesbaden	43,674
			Frankfort	134,776

Physical Character.—The country is generally hilly, and in some places even mountainous, forming a part of the great central elevated plateau of Germany. The most considerable of the ranges are the Habichtswald, the Thüringerwald, of which the greatest elevation is the Inselberg (2,930 ft.), the Meissner (2,350 ft.), the Hundsrück, Kellerwald, and Rheinhardwald.

The principal rivers are the Werra, with its numerous small affluents, but which only belongs in part to Hesse-Nassau; the Fulda, whose course appertains almost exclusively to the province; the Edder, Weser, Main, and Lahn.

Climate, Soil, Products.—The climate is generally mild, but in some of the mountainous districts, as the Rhöngebirge, it is at times very severe. The mean annual temperature is 48°,5 Fahrenheit.

The soil is almost unexceptionally fruitful and well adapted to agriculture. Cereals of all kinds yield good returns. The most cultivated districts are in the s.w. of Hanau, where much fruit and some good wines are produced. Flax is grown in Schaumburg and Lower Hesse, and tobacco in the valleys of the Werra. It is estimated that for every hundred parts the land is distributed nearly in the following ratio: woods, 40; arable land, 37; meadow land, 11; miscellaneous, 12.

The mineral products comprise copper, lead, cobalt, vitriol, alum, clay, large quantities of iron, coal, and salt, the last three of which are the property of the state. The mountain districts have many good mineral springs, the most important of which are those at Schwalheim, Wilhelmsbad, Hofgeismar, Rodenberg, and Nenndorf.

Industry, Imports, and Exports—Trade.—In addition to agriculture and the rearing of cattle and other animals, the chief branches of industry are the weaving of linen and yarn, which, although everywhere practiced, is prosecuted with most vigor about Fulda and Marburg. There are good steel and iron works at Schmalkald, and manufactories of guns at Cassel, and porcelain, glass, paper, and gold and silver wire-works in Hanau and other parts of the province. The exports consist principally of yarn and linens, iron and steel wares, fine clay, wood, leather, grain, dried fruits, and mineral waters. The transit-trade is considerable, and is principally conducted by way of Hanau, Carlshafen, and Eschwege. The internal commerce and industry center more especially in Cassel, Hanau, Frankfort-on-the-Main, Wiesbaden, Fulda, Gersfeld, Carlshafen, Dillenburg, and Limburg. There are many excellent public roads throughout the province, and upwards of 400 m. of railway, in addition to which it possesses great facilities for internal trade in its numerous navigable rivers.

Receipts, Expenditure.—According to the budget of 1864–66, the annual receipts of the electorate of Hesse-Cassel were about 5,108,310 thalers, and the expenditure 5,452,980, an excess of expenditure over the income of 344,670 thalers. The national debt in 1861 represented a capital of 3,700,000 thalers, but this was exclusive of 8½ million thalers, raised for the construction of railways, and 1½ million thalers extraordinary loans.

Army.—The army, prior to 1866, was kept at 12,000 men, of whom 5,000 were on the reserve list. Military service was compulsory between the ages of 20 and 27 years.

Education.—There are, besides numerous national schools, 10 gymnasia, 8 arts, and various polytechnic, theological, military, and other schools. Hesse-Nassau has one university at Marburg, memorable as being the first which was founded (in 1527) after the reformation, and without papal authority.

Religion.—The majority of the population belong to the Reformed or Calvinist faith, but the Lutherans, United Protestants, Catholics, and Jews are well represented. At the end of 1867 the number of Protestant churches in the province was 1375; Roman Catholic churches, 486; Jewish synagogues, 246; and other churches, 8. All the churches recognized by the state enjoy equal rights.

Law.—The supreme court of appeal is at Cassel, with two high courts of justice at Cassel and Fulda, under whose jurisdiction are various criminal and magisterial courts.

Electoral Hesse was formerly a limited monarchical government. The ruler bore the title of electoral prince and landgraf of Hesse, grand-duke of Fulda, prince of Hersfeld, Hanau, Fritzlar, and Isenburg, count of Katzenellenbogen, Dietz, etc. The dignity, which is hereditary in the male line only, is at present held by the elector Frederick Wilhelm I. The elector was assisted in the government by a council of ministers, who were partially responsible. A new constitution, based on the federal decision of 1857, was promulgated in 1860. There were two representative chambers, the higher of which comprised the princes of the electoral family, several *mediatized princes* (see MEDIATE), officers of state, and the higher nobility; while the lower chamber comprised 48 members, one-third of whom represented the landed proprietors, and the remainder the civic and rural districts. The chambers were convoked at least once in every three years. Each parish was presided over by a burgher-master (*bürgermeister*) or magistrate, each circle by a government official, and each province by a special governor.

Hesse-Cassel occupied the eighth place in the German confederation. It had three votes in the *plenum* or general council of the diet, and supplied a contingent of 6,626, and a reserve of 2,840 men to the federal army.

History.—Hesse-Cassel is the elder line of the house of Hesse, founded by landgraf Wilhelm IV., or the wise, son of Philip the magnanimous, who reigned from 1567 to to 1592, and held his court at Cassel. Wilhelm was succeeded by his son Maurice, who joined the Protestant church, and five years before his death resigned the government in 1627 to his son Wilhelm V. The latter fought on the side of Sweden during the thirty years' war, for which he was put under the ban of the empire. His two brothers, Hermann and Ernest respectively, founded the lines of Hesse-Rotenburg and Hesse-Rheinfels; and on his death in 1637 his widow assumed the regency for their young son, Wilhelm VI., and by her ability, secured for him, as an indemnification for the losses which the country had sustained during the war, the greater part of Schaumburg and the principality of Hersfeld. The successors of Wilhelm V. pursued the practice he had begun of hiring out Hessian soldiers to fight in the service of foreign princes, a practice by which the finances of the state were considerably augmented at the expense of the welfare and morality of the people; while, in some instances, it led to the formation of important alliances on the part of the reigning house. The landgraf, Friedrich I., who succeeded his father in 1730, had become king of Sweden in 1720, in right of his wife, the princess Ulrike Eleanor, sister of Charles XII. His brother, Wilhelm VIII., to whom he had resigned his Hessian territories, fought under the British and Hanoverian flag in the seven years' war, and gained considerable renown for himself and his troops during the course of the war, which was especially disastrous to the welfare of his states. Wilhelm's son, Friedrich II., persevered in the same course, and kept up a splendid court on the proceeds of the pay, amounting to £3,000,000, which the British government gave him for the services of the 22,000 Hessians who fought against the Americans in the war of independence. Friedrich, who had become a convert to the Romish church, died in 1785, and was succeeded by his son, Wilhelm IX., who reigned as Wilhelm I., after his elevation to the rank of an elector in 1803. This prince frequently shifted sides and parties during the French revolutionary and imperial war, fighting with his Hessian mercenaries first under British colors, then in conjunction with Prussia, and in 1806 as the ally of Napoleon, who in return for his aid promised to respect the neutrality of the electorate. After the battle of Jena, the French emperor, suspecting the motives which had actuated the elector in augmenting his army, threw troops into the Hessian territory, and at the peace of Tilsit incorporated the electorate in the newly formed kingdom of Westphalia. In 1813 Wilhelm returned to his dominions after the overthrow of French power in Germany, and at once began to restore the old order of things as far as he could; while he entered upon a course of vexatious litigation to recover the state lands that had been sold during his exile, and appealed to the diet with such importunate pertinacity for indemnification, that he obtained various important concessions at the congress of Vienna, although he failed in his wish to secure the title of king, of which he was especially ambitious. In accordance with the promise which he had made his subjects on his restoration to power, he summoned a body of jurists to construct a constitution; but no sooner was a draft of this new scheme completed, than he refused to fulfill his promises. His death in 1821 was regarded as a fortunate event for the electorate; but his son and successor, Wilhelm II., by his narrow policy, increased the rapidly growing disorders of the state, while his relations to his mistress, the obnoxious countess of Reichenbach, rendered him peculiarly unpopular with his subjects. These disorders were partially arrested by the retirement of the elector in 1831, and the nomination of the electoral prince to the rank of regent. But the history of the 16 years' regency of prince Friedrich Wilhelm exhibits only a series of intrigues at court, dissensions between the government and the representatives of the people, and a retrogressive policy, which left Hesse far behind other German states in material prosperity. The death of the old elector at Frankfort, whither he had retired on his abdication, raised the regent in 1847 to the rank of sovereign elector. The revolution of Paris, in 1848, extorted from the terrified prince many liberal promises of reform, some of which were redeemed; but in 1850,

after revoking many of his pledges, he summoned the obnoxious Hassenpflug and Haynau to govern the country. Hassenpflug's measures at length drew upon him a public charge of maladministration and treason; and he having persuaded the elector that his personal safety would be endangered if he remained longer among his subjects, the prince and his minister fled by night from Cassel to Wilhelmsbad. On Sept. 17, 1850, an ordinance proclaimed that the seat of government had been transferred to the latter place. Hassenpflug appealed to the confederation for its intervention, and Hesse became the rendezvous of troops; the Austrian and Bavarian contingents occupying the south, and the Prussians, apparently for the protection of the people against the elector, taking their position in the north. The threatened war was principally limited to angry protocols, but the result of the intervention was the restoration of the elector, who returned to Cassel. In 1852 a new constitution was promulgated, which in no way satisfied the people, whose conduct throughout the trying crisis had been marked by forbearance and moderation. But the policy of the government remained unchanged. In Oct., 1860, on the assembling of the chambers, a resolution was agreed to for addressing the elector, requiring the restoration of the constitution of 1831; but not till 1862, after much agitation and the interference of Prussia and Austria, did the elector so far accede to their wishes as to recognize the constitution of 1831 with the modification of 1849. In the war between Austria and Prussia, Hesse-Cassel having sided with the former, a Prussian army entered the electorate, and it was ultimately annexed to Prussia on Sept. 20, 1866.

HESSE-DARMSTADT, or HESSEN, a grand-duchy of Germany, extending (exclusive of small outlying portions) between 49° 24′ and 50° 10′ n. lat., and 7° 50′ and 9° 10′ e. long., and consisting of two nearly equal parts, separated by a strip of land belonging to Hesse-Nassau. The northern district is mountainous, being intersected by the Vogelsberg, and branches of the Taunus and Westerfeld; while the southern is level, except in the e., which is occupied by the Odenwald range. Hesse-Darmstadt is divided into the following provinces:

Provinces.	Area in sq. miles.	Pop. in 1875.	Chief towns.	Pop. 1875.
Upper Hesse	1280	254,036	Giessen	13,858
Starkenburg	1150	370,170	Darmstadt	43,695
Rhenish Hesse	525	260,012	Mainz	56,421

Giving an area of 2,953 sq.m., and a population, in 1875, of 884,218 for the entire duchy.

Physical Character.—Hesse-Darmstadt, which presents a succession of fruitful valleys and rich mountain slopes, is well watered, being traversed by the Rhine and Main, Neckar, Nahe, Lahn, Nidda, Edder, Nidder, and Wetter.—The climate of the northern districts of Hesse-Darmstadt is very much more severe than that of the southern or Starkenburg district, which shares the climate of South Germany.

Agriculture is in a very flourishing condition, nearly half of the soil being occupied by arable lands. Corn is grown in sufficient quantity for exportation, chiefly in Upper Hesse, where Indian corn, or maize, and flax are also largely cultivated, while hemp, tobacco, and poppies are raised in Rhenish Hesse. The southern districts, in which a great variety of fruit is grown, including figs, almonds, chestnuts, etc., are specially noted for the excellence of their wines, the choicest of which are the Niersteiner, Laubenheimer, Bodenheimer, and red Ingelheimer, grown in the vicinity of Mainz, the Scharlachberger near Bingen, and the Liebfrauenmilch in the districts around Worms.

The mineral products, which are inconsiderable, include copper, cobalt, iron, salt, and coal, the three latter of which are most abundant in the Wetterau districts.

Industry.—The principal branches of industry are, besides agriculture, the making of wine, which in good years yields a return of upwards of four million thalers; the manufacture of cottons, linens, and stockings, and the weaving of straw in Upper Hesse; the preparation of oils and leather; and the manufacture of paper, snuff, *papier-mâché* goods, etc. Hesse-Darmstadt is well provided with post-roads, and has a network of railways; while the steam-navigation of the Rhine, Main, and Neckar affords still more extensive means of communication, which, however, are partly or wholly closed during the winter months.

Revenue.—The budget for the years 1876–78 gives the following estimate of the financial condition of the grand-duchy: Annual receipts, 22,544,120 marks; annual expenditure, 20,294,564 marks; leaving a surplus of 2,249,556 marks. The public debt, incurred mainly for the construction of railways, amounted in 1874 to 15,510,500 marks.

Army.—The troops belonging to Hesse-Darmstadt form the 25th division of the army of the German empire, and belong to the 11th army corps. There is a military college at Darmstadt.

Education.—There are in Hesse-Darmstadt, besides its numerous national schools, 11 *real-schulen* (see GYMNASIUM), 6 gymnasia, various theological, technical, industrial, and agricultural schools; while higher educational wants are supplied by the university of Giessen, with its noble library, and numerous scientific institutions connected with it.

The chief towns support various scientific and literary societies, and the duchy generally is favorably distinguished in respect to the diffusion of knowledge.

Religion.—In regard to religion, the population was divided in 1871 as follows: Protestants, 589,272; Roman Catholics, 238,080; other creeds, 172; and Israelites, 25,373. The Lutherans have a consistory at Darmstadt, with three minor courts under its jurisdiction, while the Roman Catholic churches are under the supervision of a bishop who has his see at Mainz.

Law.—There is a supreme tribunal of law at Darmstadt, with lesser courts at Darmstadt, Giessen, and Mainz, and numerous local courts in country districts, in some of which trial by jury prevails.

Political Constitution, etc.—Hesse-Darmstadt supplied a contingent of 7,227 men, with a reserve of 3,098, to the federal army, occupied the ninth place in the German confederation (q.v.), and had 3 votes in the *plenum* or full council, and 1 vote in the limited council. Its army now forms the 25th division of the 3d army corps of the German empire. It is a limited monarchical state. Its ruler, who must be a Lutheran, bears the title of royal highness, and ranks as grand-duke of Hesse, and as a Rhenish grand-duke. The succession is hereditary in the female line in default of male issue. In accordance with the law of 1856 there are two legislative chambers of representatives, which must be convoked at least once in every 3 years, but the real power of the government rests with the council of state and the 4 ministries into which the several branches of the administration are divided.

History.—The line of Hesse-Darmstadt, the second main branch of the house, is derived from the Hessian count, George I., who, on the death of his father, Philip the magnanimous, in 1567, obtained the upper countship of Katzenellenbogen, with the town of Darmstadt for his residence, and succeeded in 1583, on the death of his brother without heirs, to a third of the patrimony of the latter. He was succeeded in 1596 by his eldest son, Ludwig V., while his third son, Frederick, became the founder of the Hesse-Homburg line (q.v.). Ludwig V., who acquired a portion of Upper Hesse, was the founder of the university of Giessen. Although Hesse-Darmstadt, like every other part of Germany, suffered considerably during the French revolutionary wars, it finally acquired a great addition to its territories through the agency of Napoleon. Ludwig X., who had succeeded his father as landgraf in 1790, joined the confederation of the Rhine, and after having acted against Austria in 1809, and in concert with the French in 1813, offered, after the battle of Leipsic, to act with the allies against France, on condition of being allowed to retain his various acquisitions of territory. He had assumed the title of grand-duke in 1806, and on that occasion he promulgated various legislative edicts, and annulled the pre-existing union of the Hesse-Darmstadt and the Hesse-Cassel diets. In 1814 he joined the German confederation, and made large cessions of territory to Prussia, Bavaria, and Hesse-Cassel, receiving by way of indemnification a portion of the French department of Donnersberg, or Mainz, extending to the Lahn, and the greater part of the principality of Isenberg, in right of which he assumed the additional title of a Rhenish grand duke. In accordance with the decree of the federal diet, Ludwig gave his subjects a representative form of government in 1820, the scheme of which was, however, so obnoxious to the assembled states, that the grand-duke and his advisers were compelled to withdraw it, and to substitute another in its place. The task of framing this constitution occupied several diets in succession, and gave rise to much angry discussion within and without the chambers. The death, in 1830, of the grand-duke, who from various causes was endeared to his subjects, widened these differences, and angry discussions soon arose in regard to the civil list to be accorded to the new grand duke, Ludwig II. In the course of the next few years, one diet after another was convoked and prorogued, but no material change was effected in the relative position of the chambers and the government. The death of the grand-duke, Ludwig II., in 1848, and the accession of his son and co-regent, Ludwig III., grand-duke until 1877, brought little change for the better. In the meantime it must, however, be admitted that, notwithstanding frequent dissensions in church and state, the duchy made considerable advances in material prosperity; railways were opened, and new roads formed; monopolies and other commercial restrictions removed; greater freedom permitted in the curriculum of the university, and a more liberal spirit infused into the system of the education imparted in the national schools. Although these and many other improvements were grudgingly yielded, they have been permanent, but the character of the grand-ducal policy has neither been liberal nor in accordance with the wishes and views of the majority of the people. See GERMANY.

HESSE-HOMBURG, formerly an independent German landgraviate, but now forming a portion of the kingdom of Prussia. The landgraviate was divided into the provinces of Homburg and Meisenheim; the former bounded by Hesse-Darmstadt and Hesse-Nassau, and the latter by Rhenish Prussia and the Bavarian palatinate.

Provinces.	Area in sq. miles.	Pop. (1861).	Chief towns.	Pop.
Homburg.....	32.90	12,617	Homburg.....	8,626
Meisenheim.....	73.08	14,200	Meisenheim.....	2,758

Giving 105.98 sq.m. for the superficial area, and 26,817 for the population of the entire landgraviate. The former of these provinces is a fruitful district lying on the slopes of the Taunus mountains, which produces grain, wine, and timber; while the latter is mountainous, and yields large quantities of coal and iron, and some excellent wine. The budget for 1861 gives the following amounts: namely, receipts, 500,520 florins; expenditure, 441,166 florins, leaving a surplus of 59,354 florins. The debt was, in 1865, 3,000,000 florins.

The troops of the landgraviate were 366 men, including a reserve of 100, which comprised the contingent of Hesse-Homburg to the federal army. Hesse-Homburg was represented by Hesse-Darmstadt in the limited council of the diet, but it held one independent vote in the *plenum* or full council. The established religion was Protestant, to which 19,000 of the inhabitants belonged, the great majority of whom were attached to the *reformirte kirche*, while there were 4,950 Catholics, and about 1000 Jews. Hesse-Homburg had a legislative representative chamber, and the government was divided into the three departments of justice, the interior, and finances.

The landgraviate was an integral part of Hesse-Darmstadt (to which it reverted on the failure of the direct line in 1866) till it was transferred, on the death of the landgraf, in 1596, to his younger son, Friedrich I., in whose family it remained as an independent state till 1866. Little change was effected in the province till the congress of Vienna, when it was augmented by the addition of Meissenberg. In 1817 Hesse-Homburg was admitted into the German confederation. In 1830 disturbances broke out in Meisenheim; but although they were soon quelled, in consequence of the powers accorded to the landgraf by the diet, several severe edicts were published in 1832 against the liberals, which excited considerable disaffection. The opening of the springs and baths at Homburg in 1833 proved an unexpected source of wealth to the state, and after the addition of gambling saloons, the establishment constituted a very important branch of the revenue. Attempts were more than once made by the diet to put down the gambling-tables; but whenever the pressure of federal intervention was removed, gambling was always resumed with fresh spirit; in 1862 however, the deputies passed a law for its gradual suppression, and since the passing of Hesse-Homburg into the hands of the Prussian government, the system has been completely suppressed. Since their first opening, play, with only temporary abatement, was prosecuted at all hours and seasons by all ranks, from peasants to princes and princesses, and almost at all ages, excepting among the subjects of Hesse-Homburg, who were stringently forbidden to participate in it.

In 1835 Hesse-Homburg joined the Zollverein (q.v.). In Mar. 1866, on the death, without heirs, of the last landgraf, Ferdinand Heinrich Friedrich, who succeeded his brother, Philip August, in 1848, the landgraviate fell to Hesse-Darmstadt, but remained united with that duchy only a few months, being ceded to Prussia on Sept. 13, 1866. It now forms part of the Prussian provinces of Hesse-Nassau and Rhenish Prussia. See GERMANY.

HESSE-NASSAU. See HESSE-CASSEL and NASSAU.

HESSIAN FLY, *Cecidomyia destructor* (see CECIDOMYIA); a dipterous insect, the larva of which has often proved extremely destructive to wheat in North America. Its ravages have occasionally even led to the abandonment of wheat culture for a time in considerable districts. It is black, with dusky wings, darker at the base, pale-brown legs, black feet, and hairy antennæ. There are two broods in the year. The maggots of the one brood live at the roots of the plants throughout the winter; those of the other are found in the lower joints of the straw, in the end of spring and beginning of summer.

HESSIAN FLY (*ante*). The eggs are laid on the young blades of the wheat, after the coming up of the plant in the fall, and also in the spring. The eggs are about $\frac{1}{50}$ of an inch long, with a diameter of only $\frac{4}{1000}$ of an inch, of a pale red color, and hatch in four or five days, if the weather be warm. The larvæ, as soon as hatched, descend between the leaf and the stalk till they reach a joint, just below the surface of the ground, at that stage of the plant's growth. Here they undergo their metamorphoses, being nourished by sucking the juices of the plant. All the transformations may require several months, sometimes a year, being often retarded by circumstances. It needs but very few of these insects to cause the plant to wither and perish. The larvæ attain their full size in five or six weeks when they are $\frac{1}{4}$ of an inch long, and have the appearance of a flax seed. In April and May the fly is released and soon begins to lay its eggs on the young wheat blades, of both autumn and spring sowing. The eggs attain the pupa state (flaxseed appearance) in June and July, the fly appearing in the autumn to lay the eggs for the next spring brood. Many of these do not come to maturity till after harvest, remaining for a time in the stubble in the pupa state. The Hessian fly is said to have been first seen in this country on Staten Island in 1776 near the place where sir William Howe disembarked the Hessian soldiers under his command; and from this circumstance received its name. The progress of the insect seems to have been about 20 m. in a year, usually migrating in swarms. It is a difficult pest to get rid of, and the eradication requires concert of action among the farmers. If the straw contain any insects in the pupa state it should be burned. The stubble should be cut quite long so as to give as much heat as possible when it is burned. Then plowing, and careful har-

rowing and collecting of the roots as far as practicable should follow, with drying, and burning. See *Insects Injurious to Vegetation*, by Dr. T. M. Harris.

HESTIA, a goddess of Greece, supposed to have been the latest in origin of the greater deities. She appears to belong to a particular stage in the advancement of civilization, and to embody the religious sanction that confirmed the social system then reached. The fact that Hestia is not mentioned in Homer shows that her worship was not then so universally acknowledged. Perhaps we may see in the connection of the Latin Jupiter and Vesta at Lavinium a relic of the worship of this same goddess under the same name (they are only two forms of the feminine of the passive participle of the root *vas*, burn), and an evidence of the connection between the two races. We find therefore in Hestia relics of the old pre-Greek worship; she is the altar-fire, presiding over all sacrifices, and sharing the honors of all the gods. The opening sacrifice was offered to Hestia; to her at the sacrificial meal the first and last libations were poured. The fire of Hestia was always kept burning, or if by any mischance it were extinguished, only sacred fire produced by friction, or directly obtained from the sun, might be used to rekindle it. But beyond this she is the goddess of family union, the personification of the idea of home, the protectress along with Zeus of the suppliants who fled for refuge to the hearth. To her therefore is ascribed the art of housebuilding. Hestia and Hermes are often united as the representatives of home and private life on the one hand, and of business and outdoor life on the other. The city union, moreover, is just the family union on a large scale; it has its center in the prytaneum, where the common hearth-fire round which the magistrates meet is always burning, and where the sacred rites that sanctify the concord of city life are performed. From this fire, as the representative of the life of the city, was taken the fire wherewith that on the hearth of a new colony was kindled. Even larger unions than the city had their central fire; in Tegea we find the Hestia of the Arcadians; and it is probable that the Achæans had theirs at Æginium. In the later mystic philosophy Hestia became the hearth of the universe, the eternal fire at the center of the world. As Hestia had her home in the prytaneum, special temples to her rarely occur. There was one in Hermione, where the only symbol of the goddess was a fire always burning on the hearth. We also hear of her house at Olympia. Her statue stood in the prytaneum at Athens beside that of peace. Though many statues of the Roman Vesta are preserved, more or less based on the Grecian conception of Hestia, yet no really Greek representation of the goddess has come down to us.

HES'YCHASTS (Gr. *Hesychazo*, to be quiet), a mystic and contemplative sect of the Greek church, who renewed in the 14th c. the errors and practices of the older Euchites, and who may be described as the Quietists of the east. There is reason to believe that the principles of the ancient mystics never entirely died out among the oriental monastic bodies; but they attracted an unusual share of public attention not only at home, but in the western church in the earlier half of the 14th century. A Basilian monk, named Barlaam, a native of Calabria, the ancient Magna Græcia, and himself of Greek origin, in the course of a visit to the monasteries of Greece, observed among the monks several practices and doctrines which he considered grievously reprehensible; and was particularly struck by the doctrinal abuses of the monks of Mt. Athos, the "holy mountain," the great stronghold of monasticism in Greece. In common with the mystics of all times, these monks placed all perfection in contemplation, and in the elevation and abstraction of soul which contemplation produces. But among many practices which he considered objectionable, there was one which especially provoked his reprobation, and, indeed, his ridicule. Believing that in the soul lay hidden a certain divine light, which it was the office of contemplation to evoke, they withdrew at stated times to a retired place, seated themselves on the earth, and fixed their eyes steadfastly on the center of the stomach (whence the sobriquet by which they were known, *omphalopsychoi, navel-souls*); and they averred that, after the allotted time of contemplation, a kind of heavenly light beamed forth upon them from the soul (whose seat, they held, was in that region), and filled them with ecstasy and supernatural delight. They declared that this light was the glory of God himself, and they connected it in some unexplained way with the light which appeared at the transfiguration of our Lord upon Tabor. Barlaam denounced these notions as fanatical and superstitious. On the other hand they were explained and warmly defended by Gregory Palamas, the archbishop of Thessalonica; and in order to settle the controversy, a council was held in Constantinople in 1341 which terminated in the triumph of Palamas and the monks. The controversy afterwards turned upon a point of doctrine—namely, on the nature of the so-called divine light supposed to emanate from the soul in this state of contemplation. Other councils were called, one of which, in 1351, again pronounced in favor of the monks, through the influence, it was said, of the court and of the celebrated John Cantacuzenus, who was an ardent patron of the Hesychasts. But the public voice was hostile to the sect, and on the retirement of their patron Cantacuzenus, who, in 1355, became a monk, they fell into obscurity. The controversy about the "thaboritic light," however, is still discussed in Greek theology. See Mosheim, ii. 659; also Fabricius, *Bib. Græc.* v. 247, 454; Rubenberg, *De Hesychastis Exercitat*, p. 378.

HESYCH'IUS, a Greek grammarian of Alexandria, flourished, according to some authorities, towards the end of the 4th century. He was the author of a Greek lexicon taken partly from earlier works of a similar character, with the addition of new words and examples from the writings of poets, orators, historians, and physicians. Its value is very great, as it supplies us with extensive information concerning the Greek language and literature, especially of an antiquarian kind. The first edition is that published at Venice in 1514; the best is by Alberti and Ruhnken (2 vols. Leyden, 1746–66), to which additions were made by Schow (Leip. 1792). Compare Ranke, *De Lexici Hesychiani vera Origine et genuina Forma* (Leip. and Quedlinburg, 1831).—Not to be confounded with the foregoing is the historian HESYCHIUS of Miletus, surnamed the "Illustrious," who flourished in the beginning of the 6th c., and was the author of the following works: 1. A book on eminent teachers (*Peri tōn en Paideia lampsantōn Sophōn*); 2. Another on the city of Constantinople (*Peri tōn Patriōn Kōnstantinoupoleōs*); and 3. A chronicle or history (*Biblion Historikon*, etc.), commencing with the earliest times, and coming down to the death of Anastasius. It is now lost. See Orellius, *Hesychii Opera* (Leip. 1820).

HESYCHIUS, SAINT, d. Alexandria, Egypt, 311 A.D.; a bishop of the Christian church, and publisher, according to Jerome, of an edition of the New Testament, and also a revision of the Septuagint. He was martyred during the Diocletian persecution.

HETEROCER'CAL (Gr. *hetĕros*, different, unequal, and *kerkos*, a tail), a term introduced by Agassiz to designate a peculiarity of structure in the tail of some fishes, in which the tail is unsymmetrical with reference to the body of the fish or the vertebral column; the vertebral column being prolonged into the upper of the two lobes of the tail, and a second lobe, more or less distinct, appearing on the under side. The heterocercal tail is, among recent fishes, characteristic of the cartilaginous fishes, and is, therefore, a much less prevalent form than the symmetrical or homocercal (Gr. *homos*, equal, tail). It is very generally regarded as indicating an affinity to saurian reptiles. But in the older geologic formations, the heterocercal is the prevalent form; in all the formations older than the oolitic it exclusively appears.

HETEROGANGLIA'TA (Gr. *hetĕros*, diverse, and *ganglion*, a ganglion), a term introduced by Owen, and adopted by many zoologists, in accordance with a scheme of zoological classification founded on the nervous system in animals, to designate the *mollusca* of Cuvier, with which are ranked the "zoophytes" of the division *polyzoa* or *bryozoa*. The nervous centers or ganglia are not arranged in a longitudinal series of symmetrical pairs, but are variously distributed in different parts of the body; one principal ganglionic mass, however, occupying a position above the gullet, with which all the nerves of the special senses which exist are connected. With it, also, all the other ganglia communicate.—Whether or not the new name heterogangliata, may ultimately come into general use among systematic zoologists, it certainly indicates a most important character in the organization of the animals to which it is applied.

HETEROPODA. See NEUCLEOBRANCHIATA, *ante*.

HETEROPTERA. See HEMIPTERA, *ante*.

HETEROSOMATA, the group of flat fishes, as the halibut, flounder, plaice, etc., which have been classified by some naturalists as a sub-order of teleost fishes, but which are now generally placed as a family called *pleuronectidæ*, of the sub-order ANACANTHINI, of the order TELEOSTEI. See FLAT-FISH and PLEURONECTIDÆ.

HETMAN, or ATAMAN, the title of the head or general of the Cossacks, now retained only among the Cossacks of the Don. From the earliest times the hetman was elected by the voice of the assembled people; the mode of election being by throwing their fur-caps at the candidate they preferred, and the one who had the largest number of caps was declared duly elected. The power of the hetman was very great, and extended over life and death. When the Cossacks, in 1654, submitted to the Russians, the hetman was permitted to retain his rights as formerly. The empress Catherine entirely abolished the dignity of hetman of the Ukraine, and substituted a government consisting of eight members. The Don Cossacks have, indeed, retained their hetman, but even he possesses but the shadow of his former power. The last elective hetman was count Platoff, who played a prominent part in the wars with France (1812–14). After his death, the hetman was appointed by the czar, and ultimately the title was made hereditary in the grand-duke, the heir to the throne.

HEUGLIN, THEODORE VON, Baron, 1824–76; African and Arctic traveler, b. Würtemberg. He went to Egypt in 1851, and till 1865 the n.e. regions of Africa were the main scene of his labors. In 1852 he accompanied Dr. Reitz, the Austrian consul at Kartum, upon his fatal journey to Abyssinia; in 1853, having been appointed Dr. Reitz's successor in the consulate, he visited Kordofan and the lower course of the white Nile; and in 1857, on his return, after about two years' absence in Europe, he was commissioned by the grand-duke Ferdinand Maximilian of Austria to explore the countries along the w. coast of the Red sea. From the latter part of 1858 to the latter part of 1860 he was again in Europe; but in 1861 he was placed at the head of the Vogel search expedition, which included Munzinger, Steudner, and Kinzelback, and was expected to make its way to Wadai. Having reached Mai-shecha, however, the explorers broke up into

three parties, Heuglin accompanying Steudner and Schubert in the direction of Adoa, Gondar, and the Galla lands. At Khartum thay joined Miss Tinne's party, and proceeded to lake Rey and the Kosanga river, but Steudner died on April 10, 1863, and Heuglin was compelled by sickness to retrace his steps. He returned to Europe in 1865. In 1870 and 1871 he made a valuable series of explorations in Spitzbergen and Nova Zembla; but 1875 found him again in n.e. Africa, in the country of the Beni-Amer and Habab. An invitation from the khedive took him abroad again in 1876, but receiving no definite appointment he returned to Europe. Later in the same year he was engaged in preparing for an exploration of the island of Socotra, when he was suddenly carried off by inflammation of the lungs.

HEUSSER, META, 1797–1876; b. Switzerland; the daughter of pastor Diethelm Schweizer. In 1857 a volume of her poems appeared anonymously, edited by Albert Knapp, and in 1867 she published another volume at Leipsic under her own name. A selection of her most popular poems has been translated by Miss Jane Borthwick, and was published in 1875 under the name of *Alpine Lyrics*.

HEVE'LIUS (known also as HEVEL or HÖVELKE), JOHANN, one of the most celebrated astronomers of the 17th c., was b. at Danzig in 1611, and d. in that city in 1687. He belonged to an honorable and wealthy family; and in 1641 he erected an observatory in his own house, and furnished it with large telescopes constructed by himself. He published numerous astronomical works. Hevelius was the first astronomer, with the exception of Gassendi, to observe a transit of Mercury (Gassendi's observation was made in 1631, that of Hevelius in 1661); and it is now generally conceded that he ranks next to Flamsteed amongst the astronomers of his day. Delambre devotes ten pages to the notice of his labors in his *Histoire de l'Astron. Mod.*, and his life has been written by J. H. Wesphal (Königsb. 1820).

HEVES, a co. in n.w. Hungary, 1462 sq.m.; pop. 216,633. It is mountainous, except in the s.e., which is a part of the great plain of Hungary. Products: wine, corn, and tobacco. Chief town Gyöngyös.

HEVES', a small t. of Hungary, in the co. of the same name, is situated in the midst of a productive flax and hemp growing district, 60 m. e.n.e. of Pesth. Pop. '69, 5,703.

HEWES, JOSEPH, 1730–79; b. N. J.; one of the signers of the American declaration of independence; educated at Princeton; became a merchant in Philadelphia, and, removing to North Carolina, was chosen delegate to the continental congress, of which he was a member, with a brief interval, for five years.

HEWIT, AUGUSTINE FRANCIS, b. Conn., 1820; graduated at Amherst, and became a minister in the Protestant Episcopal church. In 1846 he embraced the Roman Catholic faith, and two years later joined the Paulists, and became professor in their seminary in New York. He has published *Problems of the Age* and *Light and Darkness*, and has written much for magazines.

HEWIT, NATHANIEL, D.D., 1788–1867; b. Conn.; graduated at Yale college in 1808. After teaching for some years, he was licensed to preach in 1811. He studied theology at Andover, and was pastor of a Presbyterian church at Plattsburg, N.Y., 1815–17, and of a Congregational church in Fairfield, Conn., 1818–27, and in Bridgeport, Conn., 1830–62. He was one of the founders of the East Windsor theological seminary, afterwards removed to Hartford.

HEWITT, ABRAM STEVENS, b. N. Y., 1822; graduated at Columbia college, and studied law, but turned his attention to iron manufacture, and became the head of an extensive business in New Jersey. In 1867 he was one of the commissioners to the Paris exposition. He was elected to congress in 1874, 1876 and 1880. He is the son-in-law of Peter Cooper, and has been secretary of the Cooper institute from its organization.

HEX'ACHORD, a name given by the ancient Greeks, in their music, to the great sixth. In modern music, hexachord denotes the six diatonic degrees of which Guido formed his scale, better known by the six syllables, ut, re, mi, fa, sol, la, to which the scale was sung

HEX'AGON (Gr. *hex*, six, and *gōnia*, angle), a figure of six sides and six angles; when the sides and angles are equal, it is called a *regular hexagon*. If a regular hexagon be inscribed in a circle, the radius of the circle is equal in length to each side of it, and by joining the center with the angular points, six equilateral triangles will be formed. This property of the hexagon furnishes a very simple method of dividing a circle into six equal parts, and at the same time constructing the hexagon, by merely laying off round the circle lines equal to the radius. Of the three figures which can completely occupy space (the equilateral triangle, square, and hexagon), the hexagon contains the greatest area within a given perimeter, the proportions between the three different figures being nearly as the numbers 4, $5\frac{1}{5}$, 6. It is thus that bees, by making their cells of a hexagonal form, inclose the greatest space with the least expenditure of wax.

HEXAHE'DRON (Gr. *hex*, six, and *hēdra*, base), so called from its having six faces, is one of the five regular solids, according to Plato; but in modern times the term cube

(q.v.) has been used in this signification, and the hexahedron is taken to include all solid figures of six faces.

HEXAM'ETER (Gr. *hex*, six, and *metron*, a measure), the name applied to the most important form of classical verse. It is the heroic or epic verse of the Greeks and Romans, the grandest examples of which are the *Iliad* and *Odyssey* of Homer, and the *Æneid* of Virgil. It consists, as its name implies, of six feet or measures, the last of which must be a spondee (a measure composed of two long syllables), and the penultimate a dactyl (one long syllable and two short). If the penultimate is also a spondee, the verse is said to be spondaic. The following are examples of the hexameter:

Pōllă d'ă|nāntă, kă|tāntă, păr|āntă tĕ | dōchmăă | t'ēlthōn.
HOMER.

Tītyrĕ | tū pătū|læ, rĕcŭ|bāns sūb | tēgmĭnĕ | fāgī.
VIRGIL.

The hexameter has been frequently employed in modern poetry, especially in German and English. The facility with which the first of these languages forms compounds is favorable to its use; and Klopstock, Goethe, and Voss have produced admirable specimens of this kind of verse. It has been doubted whether the English is not too stubborn and intractable for the free-flowing majesty of the hexameter; and no small discussion with regard to this point has been carried on among scholars of the present day; although many think that the *Evangeline* of Longfellow, and to some extent the *Vacation Ramble* of Clough, have definitely settled the question in favor of the practicability of this measure being adopted into English. Our readers may judge from the opening lines of *Evangeline:*

This is the | forest prim|eval. The | murmuring | pines and the | hemlocks
Bearded with | moss, and with | garments | green, indis | tinct in the | twilight,
Stand like | Druids of | old, with | voices | sad and pro|phetic,
Stand like | harpers | hoar with | beards that | rest on their | bosoms.

The last two lines show where English versification is weak—viz., in its spondees, unaccented syllables being compelled to do the duty of accented ones.

HEX'APLA (Gr. *hexapla*, "the sixfold"), a celebrated edition of the Septuagint version, compiled by Origen for the purpose of restoring the purity of its text, and bringing it into closer agreement with the original Hebrew. Owing to the multiplication of transcripts of the Greek text, numerous errors had crept in; and in the frequent controversies which arose between the Jews and the Greek or Hellenist (q.v.) Christians, the latter, in appealing to the Greek text, were often mortified by the discovery that it by no means represented faithfully the Hebrew original. In order to meet this evil, Origen undertook to provide a means of at least verifying the genuine Greek text, as well as of confronting it with the original. With this view he prepared what is known as his *Tetrapla*, or "fourfold" version, which he afterwards extended into the hexapla. The *Tetrapla* contained, in four parallel columns, the Septuagint version, together with those of Aquila, Symmachus, and Theodotion. The hexapla contained, in addition, the Hebrew text, together with a transcript of that text in Greek characters. In some parts of the Old Testament there were superadded one, two, and even three other versions; so that in some parts the work contains nine columns, whence it is occasionally designated the *Henneapla*, or "ninefold." Of the origin of these latter versions but little is known.

The hexapla, however, was something more than a mere compilation of these versions. In the margin were given notes, chiefly explanatory, as, for instance, of the Hebrew names. But a still more important characteristic of the work were its restorations and corrections of the original, in which Origen was guided chiefly by the version of Theodotion. This, however, he did not effect by arbitrary alterations of the received text; but, while he retained the common text, by indicating with the help of certain signs (an asterisk for an addition, an obelisk for a retrenchment), the corrections which he sought to introduce. Both these texts, the common (*koiné ekdosis*) and that of the hexapla, are found combined in existing MSS. The hexapla, as a whole, has long been lost; several editions of those fragments of it which it has been possible to recover have been printed; by far the most complete of which is that of the celebrated Benedictine, Montfaucon (2 vols. fol., Paris, 1714), which retains, so far as it was preserved in the MSS., the arrangement and even the asterisks and obelisks of Origen. For a more detailed account, see the preface and *Prælimĭnaria* of this learned work.

HEXHAM, a small market t. of England, in the co. of Northumberland, is agreeably situated on the right bank of the Tyne, 20 m. w. of Newcastle. The Tyne is here crossed by a bridge of nine arches. The priory church, an old cruciform structure of the 12th c., is now used as the parish church. It has a lofty central tower, and at its western end are remains of the magnificent monastery erected in the 7th c. by St. Wilfrid. The chief manufactures of the town are gloves and hats. Pop. '71, 5,331.

HEYDEN, JAN VAN DER, 1637–1712; a native of Holland, an architectural landscape painter, contemporary with Hobbema and Jacob Ruysdael. He cared little for country

scenes, but excelled in reproducing the bricks of old Dutch houses, and was thoroughly master of lineal perspective.

HEYLIN, Dr. PETER, an English divine, of considerable note in his own day, was descended from an ancient Welsh family belonging to Montgomeryshire, and was b. at Burford, in Oxfordshire, Nov. 29, 1600. He studied at Oxford, where he took the degree of D.D. Through the interest of Laud, in whose theory of church and king he devoutly believed, Heylin was appointed chaplain-in-ordinary to king Charles in 1629. Subsequently he held a variety of livings, but was deprived of them during the period of the commonwealth. At the restoration, he was made subdean of Westminster, an office which many of his friends thought an utterly inadequate reward of his literary services to the royal cause. He died May 8, 1662. Heylin was a very voluminous controversial writer, but his works are of no value now, except as illustrative of the age in which he lived and the ecclesiastical party to which he belonged. Among others may be mentioned, *History of the Sabbath; Ecclesia Vindicata, or the Church of England Justified; Theologia Veterum; Examen Historicum*, containing, among other things, a violent attack on Fuller's *Church History*, which involved him in a controversy with that author; *Historia Quinquarticularis*, or a defense of Arminianism; *History of the Reformation of the Church of England;* and *Ærius Redivivus, or the History of the Presbyterians.*

HEYNE, CHRISTIAN GOTTLOB, a German scholar of great celebrity, was b. at Chemnitz, in upper Saxony, Sept. 25, 1729. His father was a poor weaver. The pastor of Chemnitz, himself very poor, got Heyne educated at a school in the suburbs, and afterwards sent him to Leipsic university, but forgot to give him money for his support. His sufferings here were something frightful, but his endurance was heroic. In 1753 he obtained the situation of under-clerk in the Brühl library at Dresden. While in this humble office, he prepared his edition of *Tibullus*, which saw the light in 1755, and happening to fall into the hands of Rhunken of Leyden, excited the admiration of that scholar. In 1756, unfortunately for Heyne, the seven years' war broke out. Frederick the great marched against Dresden, and burned, among other things, the Brühl library, but not before Heyne had edited, from a *codex* there, the *Enchiridion* of Epictetus. For some time he led a precarious life, being often without employment and without bread. In 1761 he married, and supported himself as best he could by writing for the booksellers; and in 1763, on the death of Gessner, professor of rhetoric at Göttingen, he was appointed his successor on the recommendation of Rhunken of Leyden (who had not forgotten his editions of *Tibullus* and *Epictetus*). This closed his period of misfortune. The rest of his long life was spent in peace and comfort and professorial activity. He died July 12, 1812. The principal works of Heyne, besides those mentioned, are his editions of Virgil (1767, 6th ed. 1803), Pindar (1774), Apollodorus (1787), Pliny (1790), Conon and Parthenius (1798), and Homer (8 vols. 1802; 2d ed. 1804). He also executed "almost a cart-load of translations," besides "some ten or twelve thick volumes of prolusions, eulogies, and essays," of which six volumes were published separately under the title of *Opuscula Academica* (Götting. 1785–1812); and, finally, about 7,500 reviews of books in the *Göttinger Gelehrten Anzeigen*, of which he was director from 1770. In addition to this herculean work, he had a private class or *seminarium* for the advanced study of philology and classical antiquity, from which he sent forth, in the course of his life, no less than 135 professors. Compare the Life of Heyne by his son-in-law, Ludwig Heeren (Götting. 1813), and Carlyle's essay on the same.

HEYWARD, THOMAS, 1746–1809; b. S. C.; went to London for his education, and on return practiced law. He was in the congress of 1776, and was one of the signers of the declaration of independence. He was a judge after the peace until 1798.

HEYWOOD, a large and populous t. of Lancashire, England, 8 m. n. of Manchester, on the left bank of the Roach, a branch of the Irwell. It is connected with the Rochdale canal by a branch canal; and it is on the Lancashire and Yorkshire railway. Heywood has recently increased with great rapidity both in population and wealth, partly in consequence of extensive coal-mines in the neighborhood, and partly through manufactures of various kinds. It has become an important seat of the cotton manufacture. Fustians, calicoes, nankeens, ticks, and other cotton fabrics are produced. Iron-founding, boiler-making, and the manufacture of power-looms are also extensively carried on. Pop. '71, 21,248.

HEYWOOD, JOHN, 1500–65; known as "the epigrammatist," educated at Oxford, and afterwards made the acquaintance of sir Thomas Moore, who introduced him at court. His skill in music and his ready wit made him a special favorite with Henry VIII., and afterwards with his daughter queen Mary. On the accession of Elizabeth, Heywood, who was a zealous Catholic, retired to Malines in Belgium, where he died in 1565. A collection of his works was published in 1562.

HEYWOOD, THOMAS, an English dramatist of the 16th and 17th centuries. In the preface to the *English Traveler*, written in 1633, he describes himself as having had "an entire hand or at least a main-finger in two hundred and twenty plays." Of this number, which probably afterwards was much exceeded, for his last published piece did not appear until 1655, only three-and-twenty survive; but they amply attest that had he chosen to concentrate his powers he might easily have ranked with the Massingers,

Fords, and others of his great contemporaries. His best pieces, such as *A Woman Killed with Kindness*, *Fortune by Land and Sea*, *the English Traveler*, and *The Fair Maid of the West*, belong chiefly to the domestic drama.

HEZEKI'AH (Heb. *Hiskiah*, *Yehiskiyahu*, "May Jehovah strengthen him"), King of Judah, son and successor of Ahaz, reigned from 726 [725] to 696 [697] B.C. "There was none like him among all the kings of Judah," is the praise bestowed upon him in 2 Kings xviii. 5, and scarcely less flattering is the account preserved of this monarch in 2 Chron. xxix. From the moment that, at the early age of five-and-twenty, he mounted the throne, his efforts seem chiefly to have been directed towards the abolition of the idolatry which reigned paramount in the land, and the restoration of the worship of Jehovah to its pristine purity and glory. The temple was reopened, the priests and Levites whose genealogies had proved correct had their ancient revenues assigned to them, and recommenced the daily service; and the first passover which fell in Hezekiah's reign, was—albeit a month after the appointed season—celebrated with almost unparalleled pomp for full 14 days, amidst a vast concourse of people, not only of Judah, but even of Israel. Victorious in the wars he waged with the Philistines, and relying on an Egyptian alliance, into which he had entered against the advice of Isaiah, Hezekiah dared also to withhold the annual tribute imposed by Shalmanassar in the days of his father: whereupon, as would appear from cuneiform records, Sargon, Shalmanassar's successor, invaded Judea, but without success. When, however, Sargon's successor, Sennacherib, on his way to Egypt and Ethiopia, had already seized Lachish, or, according to Chron. and Isaiah, "all the fortresses" of Judea, nothing remained for Hezekiah but to ask for peace, and to offer any ransom that Sennacherib might deem fit to impose. Sennacherib took an enormous sum in silver and gold, for which the sacred treasury and the very doors of the temple were laid under contribution: perhaps only a stratagem to convince the conqueror of the poverty of the royal coffers. It is a moot-point whether Sennacherib, after having received the money intended to procure the peace, treacherously marched upon Jerusalem at once, or whether he continued his march to Egypt, and being beaten there before Pelusium, besieged Jerusalem on his return—which would be equal to a second invasion. Hezekiah's efforts to render his capital impregnable were futile. Suddenly, however, "an angel of the Lord" (explained variously to mean the plague, an earthquake, a sudden attack by Tirhaka, or the simoom) *slew* during one single night 180,000 men in the Assyrian camp, and Sennacherib was obliged to retreat. Whether Hezekiah's illness—"shechin," ulcers, according to some, or the plague, as others understand that word—took place before or after Sennacherib's invasion, is not fully established as yet; certain it is, that after his miraculous recovery, indicated to him by the retrograde movements of the dial, he among other visits of congratulation also received that of the ambassadors of Merodach Baladon (Mardocampados), king of Babylon. The latter—as would appear from the Chaldean historian Berosus—was at that time likewise tributary to Assyria, and sent the embassy with a view to securing Hezekiah's co-operation against the common enemy. Hezekiah, imprudently enough, made a great display of his treasures, his magazines, and arsenals; but so far from impressing the messengers with his greatness, he only kindled in Merodach Baladon the desire to possess himself of all these things; and the later Babylonian invasion, ending in the captivity, is undoubtedly to be traced back to this act of vanity on the part of Hezekiah.

The remainder of Hezekiah's life was passed in profound peace and prosperity, so that he was enabled to turn his attention to the internal development of the resources of the country and the fortification of its towns. He collected great treasures and executed many highly useful works, among which the aqueducts of Jerusalem take a foremost place. His was also the golden age of prophetic poetry. Besides Isaiah, there lived in his time the prophets Micah and Nahum. From a passage in Prov. xxv. 1, it would also appear that he founded a society of literati, who collected and arranged the ancient documents of Hebrew literature, more especially the Proverbs attributed to Solomon. Hezekiah himself was a poet of no mean order; witness the hymn he composed after his recovery. Hezekiah died at the age of 54 years, in the 29th year of his reign, and was succeeded by his son Manasseh.

The Mishna (Pes. 4, 9) enumerates three things for which Hezekiah is to be praised, and three things for which he is to be blamed. The unworthy burial of his father, on account of his wickedness; the breaking of the brass serpent of Moses, which had become an object of idolatry; and the hiding of a "book of medicaments"—some superstitious work—are the three good deeds. His spoiling the doors of the temple, to pay the tribute to Sennacherib; the stopping up of the upper Gihon during the siege of Jerusalem; and his postponing the first passover for a month (see above), are his three wicked deeds.

HIACOOMES, 1610-90; said to have been the first Indian convert to Christianity in New England. He was taught to read, and was for a time a preacher on the island of Martha's Vineyard, where he formed a church and became its first pastor.

HIBBARD, FREEBORN GARRETSON, D.D.; b. N. Y., 1811; at 18 years of age became a Methodist preacher. He labored in w. New York for 30 years. In 1860 he was chosen editor of the *Northern Christian Advocate*, but in 1864 he resigned preaching.

Among his works are *Baptism, Geography, and History of Palestine; Religion of Childhood*, etc.

HIBERNA'TION (from *hibernare*, to pass the winter) is the term applied by naturalists to express a peculiar condition of sleep in which certain animals—chiefly cheiroptera and rodentia—pass the winter season. It is not very clearly known to what extent hibernation prevails in the animal kingdom. The bats, the hedgehog, the badger, and the dormouse are the animals which in England present the most striking examples of this phenomenon. No birds hibernate in the British isles. The term hibernation is not a good one, because summer heat produces in some animals a very similar condition to that which winter cold produces in others; hence the Germans use the words *Winterschlaf* (winter sleep) and *Sommerschlaf* (summer sleep) to express the two similar if not identical conditions.

The following are the most marked peculiarities presented by bats, hedgehogs, and dormice, when in a state of perfect hibernation: The respiration is very nearly suspended, as is shown (1) by the absence of all detectable respiratory acts; (2) by the almost entire absence of any change in the air in the bell-jar, or case in which the animal is placed during the investigation; (3) by the subsidence of the temperature to that of the atmosphere; and (4) by the capability of supporting, for a great length of time, the entire privation of air. The circulation is reduced to an extreme degree of slowness. In an observation made by Dr. Marshall Hall, the heart of a bat was observed to beat only twenty-eight times in the minute. The excretions are very scanty. The bat is observed to have scarcely any excretion during its continued lethargy. In regard to the nervous system, sensation and volition are quiescent, but reflex or excito-motary actions are very readily produced. The slightest touch applied to one of the spines of the hedgehog, or the merest shake given to a bat, induces one or two inspiratory movements. Dr. Marshall Hall made the important discovery that, while the respiration is almost totally suspended, the muscular irritability is proportionally augmented. All hibernating animals instinctively adopt various measures to secure themselves, during the lethargic period, from sources of disturbance and excitement. They choose sheltered and retired situations, as caves, burrows, etc. Some form themselves nests; others congregate together in large numbers. The hedgehog and dormouse roll themselves up into a ball; the bats group together in clusters, with the head downwards, and in some species the wings are spread, so that each individual embraces and shelters its neighbor. Revivescence is due partly to the return of warmth, but mainly in all probability to the calls of hunger. The return of the respiration and animal heat to the normal standard is very gradual.

The physiological use of hibernation is doubtless to enable certain animals to avoid the consequences of severe winter cold, and (especially in the case of the insectivorous animals) the deprivation of food. Before the period of hibernation, a large amount of fat is accumulated in the organism, and this fat constitutes the fuel on which the animal lives and supports its comparatively trifling heat during the winter. The other tissues suffer to a less extent, and the total loss of weight is sometimes nearly 40 per cent—a proportion fully as great as that which is usually sustained in death by starvation. For a full account of the phenomena of hibernation, the reader is referred to Barkow, *Der Winterschlaf nach seiner Erscheinungen im Thierreich dargestellt* (Berlin, 1846)

HIBER'NIA, IBERNIA, IVERNIA, also **IERNE,** names by which Ireland is designated in the classical writers. The first mention of Ireland in ancient times occurs in a poem on the Argonautic expedition, attributed to the mythical Orpheus, and perhaps as early as the time of the first Darius. Aristotle speaks of two islands situated in the ocean beyond the pillars of Hercules, "called Britannic, very large, Albion and *Ierne*, beyond the Celtæ." Both Diodorus Siculus and Strabo report the natives to be addicted to cannibalism; but, by their own admission, on insufficient grounds. Pomponius Mela, with quite an Irish warmth of eulogy, declares the herbage to be so luxuriant that the cattle who feed on it sometimes burst. Pliny repeats this statement, and adds that the Hibernian mother trains her child from the very first to eat food from the point of a sword. But the most important of all classical authorities on Hibernia is Ptolemy, who describes the country, and gives the names of the principal rivers, promontories, seaports, and inland towns. The island was never conquered, nor even explored, by the Romans. See IRELAND.

HIBIS'CUS, a genus of plants of the natural order *malvaceæ*, the type of a tribe or suborder distinguished by a double calyx and fruit of three or more many-seeded carpels united into a many-celled capsule. The species are numerous, natives of warm climates, some of them trees or shrubs, but most of them large herbaceous plants, annual or perennial. The flowers of many are very beautiful. *H. syriacus*, sometimes called *althæa frutex*, a native of Syria and Carniola, has long been in cultivation as an ornamental shrub, and proves sufficiently hardy in many parts of Britain. Some are favorite hothouse plants. The characteristic mucilaginous and fibrous properties of the *malvaceæ* are very strongly developed in this tribe. *H. abelmoschus* (or *abelmoschus esculentus*) so abounds in mucilage that it is much used in the n.w. of India for clarifying sugar. The fruit of *H. esculentus* (or *abelmoschus esculentus*) is in general use both in the

East and West Indies for thickening soups, and otherwise as an article of food. It is called GOMBO, GOBBO, and OCHRO in the West Indies; BANDIKAI, RAM-TURAI, and DENROOS in different parts of India; and BAMMIA in the w. of Africa: if indeed the East Indian *H. longifolius* and the African *H. bammia* are, as seems probable, mere varieties. It is an annual plant, with a soft herbaceous stem, 3 to 5 ft. high, crenate leaves, axillary sulphur-colored flowers, and pyramidal, somewhat podlike capsules. It is cultivated in some parts of the s. of Europe. The fruit is used in an unripe state. It is generally much esteemed, but is disliked by some on account of its viscidity. It enters, as an important ingredient, into the *pepper-pot* of the West Indies. The ripe seeds are sometimes used in soups as barley. The bark of *H. tiliaceus*—a tree of 20 ft. high, with a very thick bole—so abounds in mucilage that by chewing it the natives of the South Sea islands obtain nourishment in times of scarcity. This tree, the BOLA of Bengal—supposed to be the same with the MOHO or MOHAUT of the West Indies (*H. arboreus*)—is one of the most abundant trees of the South Sea islands; and the wood, being light, tough, and durable, is much used for many purposes. The bark is very fibrous, and cordage and matting are made of the fiber in various tropical countries. Many other species yield fibers, some of them coarse, some of them fine and beautiful, which are used in different countries; but the most important in this respect is *H. cannabinus*, the AMBAREE HEMP and DECKANEE HEMP of western India, called PALUNGOO at Madras, and MAESTA PAUT in Bengal; a plant very generally cultivated in all parts of India, although nowhere to a great extent. It is an annual herbaceous plant, having a straight unbranching stem, 3 to 7 ft. high. The fiber is not so strong as hemp, and is useful only for ropes and coarse fabrics. It has been suggested that many species of hibiscus might be found valuable for the manufacture of paper.—*H. sabdariffa* is very generally cultivated in warm countries, on account of its calyx, which, as the fruit ripens, becomes fleshy, and acquires a very pleasant acidity. It is much used for making tarts and jelly, and a decoction of it, sweetened and fermented, affords a refreshing beverage, well known in the West Indies as *sorrel cool drink*, the plant being called RED SORREL. *H. abelmoschus* (or *abelmoschus moschatus*), sometimes called MUSK-SEED, another plant common in widely separated tropical countries, is cultivated for its seeds, which have a fragrance between that of musk and that of amber. They are much used by perfumers, and are called *ambrette* or *graines d'ambrette*. In Egypt and Arabia they are mixed with coffee, and stimulant and stomachic qualities are ascribed to them. The petals of *H. rosa-sinensis* are astringent, and are used by the Chinese to stain their eyebrows and their shoes black.

HICCOUGH, or HICCUP, consists of sudden short convulsive inspirations, attended with a peculiar sound produced in the larynx, and immediately followed by expiration. The movements concerned in the production of hiccough are a spasmodic contraction of the diaphragm, and a certain degree of constriction in the glottis, which occasions the peculiar sound, and limits the amount of air inspired. These convulsive inspirations commonly occur in paroxysms, and succeed each other at intervals of a few seconds. The paroxysm may last only a few minutes, or may extend to hours or days; in the last-named case, it may be dangerous to life, from the exhaustion which it causes, but usually it merely excites a feeling of uneasiness or slight pain about the region of the diaphragm.

A debilitated state of the system predisposes to hiccough. In those predisposed to it, any gastric derangement, as emptiness, or over-distention of the stomach, the ingestion of cold water, excessive acidity, etc., will provoke it. Certain diseases are frequently attended by hiccough.

When the attack is slight, it may often be stopped by making a very full inspiration, and then holding the breath as long as possible, the diaphragm being thus held in a state of voluntary contraction. Strong pressure, as a belt tightly drawn round the waist, will sometimes give relief. In more obstinate cases, aromatic spirit of ammonia, camphor, musk, etc., may be resorted to. A combination of camphor and chloroform, and the frequent swallowing of small rounded pieces of ice, are perhaps the most efficient remedies.

HICKES, GEORGE, D.D., an eminent English divine and philologist, was b. at Newsham, Yorkshire, June 20, 1642. He studied at Oxford, and in 1664 was elected fellow of Lincoln college. In 1665 he passed M.A., and in 1666 was admitted into orders. In 1676 he became chaplain to John, duke of Lauderdale, whom, in 1677, he accompanied to Edinburgh. In 1678 he received the degree of D.D. from the university of Glasgow, and in 1679 from that of Oxford. In 1683 he was appointed one of the king's chaplains, and the following year made dean of Worcester. Refusing at the revolution to take the oaths to king William III., he was deprived of all his benefices. In 1693 he was sent with a list of the nonjuring clergy to the exiled king at St. Germains, and in 1694 was consecrated by a prelate of his own party suffragan bishop of Thetford. His publications in controversial and practical divinity are numerous. His greatest work, entitled *Thesaurus Grammatico-Criticus et Archæologicus Linguarum Veterum Septentrionalium*, appeard at Oxford in 1705, 3 vols. fol. He died Dec. 15, 1715.

HICKMAN, a co. in w. Kentucky, on the Mississippi, intersected by Obion river and the Mobile and Ohio and the New Orleans, St. Louis and Chicago railroads; 220

sq.m.; pop. '70, 8,453—1471 colored. The surface is undulating, and the soil is fertile; chief productions: corn, tobacco, and pork. Co. seat, Clinton.

HICKMAN, a co. in middle Tennessee, intersected by Duck river; 550 sq.m; pop. '70, 9,856—1471 colored. The surface is hilly, and much of it is covered with forests. The soil is fertile; corn, cotton, and pork are the main products. Co. seat, Centerville.

HICKOK, LAURENS PERSEUS, D.D., LL.D., b. in Danbury, Conn., 1798; pastor at Newtown, Kent, and Litchfield, Conn., 1822–36; professor of theology in Western Reserve college, Ohio, 1836–44; professor in Auburn theological seminary, 1844–52; professor of mental and moral science in Union college, and vice-president, 1852–66, and president, 1866–68. Since his resignation of the last-named office he has resided at Amherst, Mass. His published works are: *Science of the Mind; Rational Psychology; Moral Science; Rational Cosmology; Creator and Creation; Humanity Immortal; Logic and Reason.* His philosophical views may be indicated by a brief outline of his *Science of the Mind* and of a part of his *Moral Science:*—SCIENCE OF THE MIND. I. *General facts of the mind:* 1. The fact of its existence. 2. Its existence not phenomenal, or ideal. 3. It has its conscious identity through all changes. 4. It is essentially self-active. II. *Primitive facts of mind:*—1. Sensation. 2. Consciousness. 3. Capacity for knowing, or intellect; for feeling, or susceptibility; for willing, or the will. Intellect comprises sense, understanding, and reason; susceptibility is animal, rational, and spiritual; the will has immanent preferences, governing purposes, and desultory volitions. 4. Man, endowed with these mental capacities, is competent to attain the end of his being. —MORAL SCIENCE. *Pure morality.* I. Duties to mankind: 1. Personal duties. *Self-control.* General maxim: Bear and forbear. Particular maxims: Do yourself no harm; keep under your body; rule your spirit. *Self-culture.* General maxim: Purify and perfect your whole being. Particular maxims: Grow in stature; in practical knowledge; in rational wisdom. 2. Relative duties. *Kindness.* General maxim: Do good unto all men as you have opportunity. Particular maxims: Owe no man anything; give to the poor; be thankful. *Respect.* General maxim: Honor all men. Particular maxims: Be courteous; deal justly; sustain your neighbor's good name; be obedient to government. II. Duties to nature: Do not mar it; use it; adorn and perfect it; explore it; make it a discipline to virtue. III. Duties to God: General maxim: Worship God. Particular virtues: Humility, reverence, godly fear.

HICK'ORY, *Carya*, a genus of trees formerly included among walnuts (*juglans*). The hickories are exclusively North American. They are large and beautiful trees, attaining a height of 70 or 80 ft., with pinnate leaves. The timber of all of them is very heavy, strong, and tenacious, but decays speedily when exposed to heat and moisture, and is said to be peculiarly liable to injury from worms. Great quantities of hickory are used to make hoops for casks. It is much used for handspikes. Shafts of carriages, handles of whips and golf-clubs, large screws, etc., are made of it. It is greatly esteemed for fuel. The nuts of some of the species are excellent eating, and much resemble walnuts. *C. alba*, the SHELL-BARK, or SHAG-BARK hickory, so called from its shaggy outer bark peeling off in long narrow plates, yields the common *hickory-nut* of the northern parts of the United States; also known as the *Kisky Thomas nut.* It abounds on lake Erie and in some parts of New Jersey and Pennsylvania. The trunk is slender. The leaves are often 20 in. long. The nuts are in considerable request, and are sometimes exported. The shell is thin but hard, the kernel sweet. An oil, which is used by the Indians as an article of food, is obtained from it by pounding and boiling. *C. sulcata*, the THICK SHELL-BARK hickory, a very similar tree, abounding in the fertile valleys of the Alleghany mountains, has a nut with a thick yellowish shell, which is often brought to market in America, under the names of Springfield nut and Gloucester nut.—*C. olivæformis* yields the PACANE or PECAN NUT, sometimes called the Illinois nut.—Other species yield the MOCKER NUT, PIG NUT, and BITTER NUT.

HICK'ORY, a co. in s.w. Missouri, intersected by Pomme de Terre river; 408 sq.m.; pop. '80, 7,388—50 colored. About half the surface is prairie; the remainder is undulating and mostly covered covered with forests. Productions: corn, wheat, oats, and pork. Co. seat, Hermitage.

HICKS, ELIAS, a celebrated American preacher of the society of Friends, was b. at Hempstead, L. I., Mar. 19, 1748. His gifts were early recognized by the society, and at the age of 27 he had become a well-known preacher, and for many years traveled through the states and Canada. His unitarianism, or denial of the divinity of Christ and a vicarious atonement, brought him into disfavor with orthodox Friends; but he preached his own views with perseverance, and at the age of 80 still traveled and preached. The result of his labors was a schism of the society into two divisions, popularly known as orthodox and Hicksite Quakers. He died at Jericho, L. I., Feb. 27, 1830. See Elias Hicks, *Journal of his Life and Labors* (Philadelphia, 1828).

HICKS, ELIAS (*ante*), very early in his career became known as a strong opponent of slavery, against which he directed some of his most powerful discourses; making in addition personal exertions and sacrifices to protect and encourage emancipated slaves. He was bold and outspoken, and his meetings drew together people of all creeds. The

name of Hicksites, given by way of reproach to the branch of the society of Friends to which he adhered, was never recognized by him. His relations to the society are best given in his own words. He felt himself called upon, under the influence of the love of the gospel, to admonish his brethren to rally to the ancient standard, the light of truth manifested in the heart, and to follow no man any farther than he should be found a follower of Christ. A journal of his religious travels has been published; also, *Observations on Slavery* and *Doctrinal Epistle*. A volume of his sermons has been published since his death.

HICKS, THOMAS, b. Penn., 1823; began to paint portraits when a boy 15 years of age; studied art in New York, and was represented in the exhibition of 1841 by "The Death of Abel." He resided in Europe, 1845–48, chiefly at Rome; then studied in Paris, and returned in 1849 to settle in New York. He is best known as a successful portrait-painter. Among other portraits from his brush are those of Dr. Kane, Longfellow, Margaret Fuller Ossoli, Henry Ward Beecher, Edwin Booth as "Iago," and a large painting of "Contemporaneous Authors of America."

HIDAGE, an extraordinary tax payable to the kings of England for every "hide" of land. This tax was levied in money, provision, armor, and other articles; and when the Danes landed in Sandwich in 994, king Ethelred taxed all his lands by hides, so that every 310 hides found one ship furnished, and every eight hides furnished one jack and one saddle, to arm for the defense of the kingdom. Sometimes the word hidage was used to signify exemption from that tax; and this immunity was also called *hide-gild*, and signified a price or ransom paid to save one's skin.

HIDAL'GO (Spanish; in Portuguese, *Fidalgo;* a word derived by some from *hijo del Goto*, "son of a Goth," implying purity of descent, and by others from *hijo de alguno*, "son of somebody") is the title of a class of the lower nobility in Spain.

HIDALGO, a co. in s.w. Texas, on the Rio Grande; 3,250 sq.m.; pop. '80, 4,347—114 colored. A large part of the soil is sandy, but produces good pasturage; a portion is productive, and with irrigation will yield two crops in a season. Stock-raising is the chief business. Co. seat, Hidalgo.

HIDALGO Y COSTILLA, DON MIGUEL, a South American, b. near the close of the 18th c.; executed in Mexico July 27, 1811. He was a Roman Catholic priest, but so much dissatisfied with the government of Mexico, in which country he had settled, that he conspired with the Indians to produce a general insurrection on Nov. 1, 1810. Fear of discovery led him to hasten his plans, and the revolt began in September among the officers of the garrison at Guanajuato. His eloquence had a powerful effect on the people, and to heighten the enthusiasm he held aloft a figure of Our Lady of Guadalupe, patron saint of Mexico, and gave to his insurrection the character of a crusade. He plundered several cities, and finally proceeded to attack the capital; but an excommunication being issued against him by the archprimate, his followers were inspired with mistrust, and two almost simultaneous defeats culminated in a total rout of all his forces, Jan. 17, 1811. He set out for the United States, to procure assistance, but was captured, degraded from his priestly office, and shot. Some years later he was extolled as a saint.

HIDES. See LEATHER, *ante*.

HI'ERA PI'CRA, or HOLY BITTER, once a highly popular remedy, and still much employed in domestic medicine and in veterinary practice, is composed of four parts of powdered aloes and one part of canella. It is identical with the officinal preparation known as *pulvis aloes cum canella*. The principal objection to its use as a purgative medicine is that the nauseous taste of the aloes is not concealed by the canella; and that, like aloetic preparations generally, it is liable to cause irritation of the lower part of the intestinal canal.

HIERA'CIUM. See HAWKWEED.

HIERAP'OLIS, a city in Phrygia, at the junction of the Lycus and Meander. It possessed warm springs which had and still have a remarkable power of forming incrustations. Its name Hierapolis is due to the sanctity conferred on it by these hot springs and by the Plutonium, a small cave under a projecting rock, from which there constantly emanated a dark vapor deadly to man and beast. In reference to this we sometimes find on its coins Pluto carrying off Proserpine. The water was also much used for dyeing. Nothing is known of the origin of the city; from the legend on coins, with a radiant head of the sun-god, Eckhel concludes that a Greek foundation was made under the guidance of Apollo; but a native city may have already existed there. On the coins of the city occur native names of the sun-god, probably a Phrygian form of the Greek Zeus, the goddess of healthful drinking, Euposia, and Cybele who was one of the chief deities of the place. Little is known of the history of the city. The philosopher Epictetus was born there; and there St. Paul founded a church. The very considerable ruins which still exist, called Pambuk Kalessi ("Cotton Castle"), have been described by Pococke, Leake, etc. The ancient theater and gymnasium are in a state of remarkable preservation.

HIERAPOLIS, a city in Syria, 16 m. s.w. from the junction of the Euphrates and the Sajur. Besides the natural strength of its position, it was important as lying on

the line of intercourse between n. Syria and Mesopotamia, and was always a great trading city. Its early history is quite unknown. It is not mentioned during the Assyrian wars in this part of Syria. Abdul Faráz asserts that Josiah was defeated there by Pharaoh Necho (611 B.C.) on his march towards Carchemish; but according to 2 Chron. xxxv., the battle took place at Megiddo, some distance w. of the Jordan, and probably Abdul Faráz confounded places altogether different. No proof exists that Hierapolis was an important city before the time of the Seleucidæ, and prof. Sayce suggests that it then succeeded to the trade and name of the older city, Bambyce, which had now decayed. The romance of trade by which this name has become naturalized in many European languages deserves a passing notice. As the city lay on the highway to the east, cotton and silk were important branches of its trade. Probably cotton plantations existed there in old time; and after the cultivation of silk was introduced to w. Asia, in the time of the Sassanian kings, large groves of mulberry-trees surrounded the city. In Asia cotton seems to have been recognized as a distinct article of commerce, and was named after the city which was the chief seat of its manufacture, as muslin is from Mosul. By the crusaders the stuff and the name were carried to Europe, and the latter exists in English in the form of "bombazine." The Syrian goddess Atargatis, called by the Greeks Decerto, a personification of the nature power worshiped under different names over the whole of w. Asia, had one of her most famous temples in the city; and perhaps Mambe may have been a local name for the goddess. Hence in the 3d c. B.C., when, under the Seleucid kings, Bambyce became a great Greek city and the most important station between Antioch and Seleucia, it was called Hierapolis or Hieropolis. The latter form is found on coins, the former is used in classical literature. The coinage of Hierapolis begins under the Seleucidæ. The autonomous coins, probably for commercial reasons, imitate closely the coins of Antioch. The temple was plundered by Crassus on his Parthian expedition (53 B.C.). Under Diocletian or Constantine, Hierapolis became the capital of the new province of Euphratensis, a name which soon gave place to the older name Commagene. As paganism decayed, Hierapolis ceased to be the sacred city, and recovered its ancient name; at the same time its importance and population declined. In the time of Julian, who concentrated there the Roman troops for the fatal Parthian campaign, it was still one of the greatest cities of Syria; but under Justinian, who made some attempt to restore it, great part of its area was a desert; and the once strong fortifications were so decayed that the place was not defensible against the Parthian king Chosroes. At the Arab conquest it passed into the hands of the caliphs. Haroun-al-Raschid (786–808) restored it and strengthened its walls, and it is mentioned about 1150 by Edrisi as a strong city. As the empire of the caliphs dwindled, it appeared as Mambedj, a frontier post in the struggle between Christians and Mohammedans, and its possession carried with it the rule in this part of Syria. The emperor Romanus Diogenes captured it in his gallant struggle against the Turks (1068). Recaptured by the Seljuk Turks, it soon afterwards fell into the power of the crusaders, until it was stormed by Saladin (1175). It was for some time the head-quarters of the Mongol host under Hulagu Khan; and, as with many other Syrian cities, its desolation dates from this time. The ruins which still exist, called Kara Bambuche or Buyuk Mambedj, have been described by Pococke and others, and most carefully by Chesney.

HI'ERARCHY (Gr. *hieros*, sacred, and *archo*, to govern), the name used by theological writers to designate the whole sacred governing and ministering body in the church, distributed according to its several gradations. The word, in its strict acceptation, is, of course, only applicable to the Roman Catholic church, and to those Christian communities which retain the prelatical form of church government, or at least the distinctions of ecclesiastical order and gradation. In considering the hierarchy of the Catholic church, it is necessary to bear in mind the well-known distinction of *order* and of *jurisdiction*. I. Considered under the head of *order*, the hierarchy embraces all the various orders or classes of sacred ministers to whom has been assigned the duty of directing the public worship, administering the sacraments, and discharging the various other offices connected with the preaching of the gospel; and these are of two kinds—the orders directly instituted by divine authority, and those established by ecclesiastical ordinance. Theologians commonly distinguish a *hierarchy of divine right*, and a *hierarchy of ecclesiastical right*. (1) The first includes the three ranks of bishops, priests, and deacons. The bishops are believed, as successors of the apostles, to have inherited the integrity of the Christian priesthood. The order of episcopate, however, is not believed to be a distinct order from that of priesthood, but only a fuller and entirely unrestricted form of that order. In all that regards what Catholics believe to be the Christian sacrifice of the eucharist, they hold that the priest possesses the same powers *of order* with the bishop; but he cannot confer the sacrament of orders, nor can he validly exercise the power of absolving in the sacrament of penance without the approbation of the bishop. The office of deacons is to serve as helpmates of the priests and bishops, especially in the administration of the eucharist and baptism, and in the relief of the material as well as the spiritual necessities of the faithful (Acts vi. 1, and foll.). (2) To the three ranks thus primitively instituted, several others have been added by ecclesiastical ordinance. See ORDERS, MINOR.—II. The *hierarchy of jurisdiction* directly regards, and is founded upon, the government of the church, and it comprises not only

all the successive degrees of ecclesiastical authority derived from the greater or less local extension of the several spheres within which such governing authority is limited—beginning with the pope as primate of the universal church, and extending to the patriarchs as ruling their several patriarchates, the primates in the several kingdoms as national churches, and the metropolitans or archbishops within their respective provinces—but also, although less properly, the ecclesiastical grades which, although ecclesiastical jurisdiction may be attached to them, are more directly honorary in their nature, as those of the cardinalate, the archipresbyterate, and the archidiaconate.

In the Anglican church, with the office of the episcopate, the theory of a hierarchical gradation of rank and of authority has been retained. The Anglican hierarchy comprises bishops, priests, and deacons. In the Scottish church it is of course unknown, as it is in the greater number of the foreign Protestant churches; while those Lutheran communities which have retained or have revived the title of bishop concede little to the office which can be considered as imparting to the distinction of grades in the ministry which it imports a strict hierarchical character. The Lutheran bishop has little beyond his brother-ministers, except the right to bear certain insignia, and the first place in the consistories.

In the well-known work, *The Celestial Hierarchy*, falsely ascribed to Dionysius the Areopagite, the hierarchy includes Christ as its head, and the various orders of angels as his ministering spirits.

HIERAT'IC WRITING. See HIEROGLYPHICS.

HIERAX, an ascetic of the 3d c. A.D. in Egypt, where he lived to the age of 90, supporting himself by caligraphy and devoting his leisure to scientific and literary pursuits, especially to the study of the Bible. He was the author of biblical commentaries both in Greek and Coptic, and is said to have composed many hymns. He ultimately became leader of the sect of the Hieracites, an ascetic society from which persons living in the married state were excluded, and of which one of the leading tenets was that only the celibate could enter the kingdom of heaven. This doctrine they based on a literal interpretation of the parable of the ten virgins; on other points, however, Hierax followed Origen in allegorizing Scripture; thus he thought that the narrative of the fall and the doctrine of the resurrection ought both to be taken in a scriptural sense. It is upon this apparently Manichæan view of matrimony, taken with his denial of the resurrection and of a visible paradise, and his assertions that infants, as incapable of "striving lawfully," cannot inherit the kingdom of God, that his reputation as a heretic chiefly depends.

HI'ERO I., King of Syracuse, succeeded his brother Gelon in the year 478 B.C. The most important event of his reign was the naval victory gained by his fleet and that of the Cumani over the Etruscans in 474, which deprived the latter of their supremacy in the Tyrrhenian sea. In the year 472 Thrasidæus, who had meanwhile become tyrant of Agrigentum, was conquered by Hiero. Hiero himself was violent and rapacious, far inferior in character to his brother Gelon. His love of poetry, and the manner in which he entertained poets like Simonides, Æschylus, Bacchylides, and Pindar at his court, have perhaps caused him to be overestimated.

HIERO I. (*ante*), Tyrant of Syracuse, succeeded his brother Gelon, 478 B.C. Hiero had already distinguished himself at Himera. A jealousy arising between him and his brother Polyzelus, who had the command of the army, war was on the point of breaking out between Hiero and Theron of Agrigentum, who had espoused the cause of Polyzelus, when a reconciliation took place between the brothers. Hiero seized Naxos and Catana, transferring the inhabitants to Leontini. Peopling Catana with natives of Syracuse, he changed its name to Ætna. Upon the death of Theron war broke out between Hiero and Thrasydæus, son of Theron, but victory declared in favor of Hiero. His tyrannical measures led him to fear attempts against his life, and he kept up a large body of mercenaries, as well as numerous spies. He deserves credit in two important respects. By his vigorous assistance to the Cumæans the power of the Etruscan pirates was completely destroyed. Besides defeating the pirates, Hiero was the patron of poets and philosophers. He has been immortalized in the *Odes* of Pinder as a successful competitor at the Grecian games.

HIERO II., King of Syracuse (269–214 B.C.), was the son of a noble Syracusan named Hierocles. During the troubles which prevailed in Sicily, after the retreat of king Pyrrhus, 275 B.C., Hiero greatly distinguished himself, and was first appointed commander-in-chief and then elected king. He joined the Carthaginians in besieging Messana, which had surrendered to the Romans, but he was beaten by Appius Claudius the Roman consul, and obliged to retire to Syracuse, where he was soon blockaded. In 263, seeing himself threatened by a large army under Manius Valerius Maximus, he concluded a peace with the Romans for 15 years, during which he proved so faithful to his engagements that in 248 peace was permanently established. Hiero himself visited Rome in 237, on which occasion he presented the Roman people with 200,000 bushels of corn. In the second Punic war he likewise proved himself the faithful ally of the Romans, and supported them with money and troops, especially after their defeat at the lake of Thrasymene, when the golden statues of the goddess of Victory, weighing

320 lbs., which he sent to Rome, were welcomed as a good omen. He died about the year 216, in the 92d year of his age. His son Gelon having died before him, he was succeeded by his grandson Hieronymus. Hiero, by his clemency, wisdom, and simplicity, had gained the affections of the Syracusans, who refused on several occasions to accept his resignation of the kingly office. He devoted great attention to the improvement of agriculture, and his laws respecting the tithe of corn, etc. (*leges Hieronicæ*), were still in force in the country in Cicero's time. He was likewise a patron of the arts, particularly architecture. In these pursuits, as well as in the construction of warlike machines, he was assisted by his friend and relative Archimedes.

HIERO II. (*ante*), King of Syracuse, b. near the end of the 4th c. B.C. For upwards of 40 years Hiero was the steady friend of the Romans. He gave them valuable aid during the first Punic war at the sieges of Agrigentum and Lilybæum. As a reward, the tribute which he formerly paid was remitted, and he was included in the treaty of peace at the close of the first Punic war, 241 B.C. After this he visited Rome, where he displayed great liberality and received signal honors. At the breaking out of the second Punic war he remained equally steady in his friendship with the Romans, whom he assisted with ships and provisions. He is supposed to have died 216 B.C., upwards of 90 years of age. His government was mild and eminently popular. He laid aside the pomp of royalty, and was scarcely distinguishable from a private citizen. The corn laws which he established were so admirable that in subsequent times, when the Romans took possession of Sicily, they were retained.

HIER'OCLES, a common name among the Greeks. The most celebrated of this name was Hierocles, the Neoplatonist, who lived at Alexandria about the middle of the 5th c., and enjoyed a great reputation. He is usually reckoned the author of a commentary on the golden verses of Pythagoras, of which the best edition is that by Warren (Lond. 1742). Of Hierocles's history we know nothing. His most celebrated works are, *On Providence, Fate, and the Harmony between the Divine Government and Man's Free-will;* of which there remain only a few extracts preserved by Photius, and published by Morelli (Paris, 1593 and 1597). Another ethical work of his, *On Justice, Reverence of the Gods, and the Domestic and Social Virtues*, is known to us from a number of extracts in Stobæus. There is also a work called *Asteia* ("a collection of jests and ludicrous stories") attributed to him, but it is now believed to belong to a much later age than that of Hierocles. This and the previous works are contained in Pearson and Needham's Commentary on Pythagoras (Cambridge, 1709).

HIER'OCLES OF BITHYNIA, 284–305 A.D., a Roman proconsul in the reign of Diocletian; is said to have been the instigator of the fierce persecution of the Christians under Galerius Cæsar in 303. He was a man of considerable intellectual culture, and wrote a work in two books, in which he endeavored to persuade Christians that their sacred books were full of contradictions, and that in moral influence and miraculous power Christ was inferior to Apollonius of Tyana. This treatise has not come down to our times, and is known to us through Lactantius, and still more through Eusebius, who is the author of a refutation.

HIEROGLYPH'ICS (literally meaning sacred sculptures), a term applied to those representations of natural or artificial objects used to express language, especially those which the ancient Egyptians and Mexicans employed for that purpose. The term *hieroglyph* would, however, be more correctly applied to these figures. The number of those used by the ancient Egyptians was probably about 1000, and by their means they were enabled to express all the ideas required with correctness, clearness, and facility. They consist of representations of celestial bodies, the human form and its parts in various attitudes, animals, fishes, reptiles, works of art and attire, and fantastic forms. These were either engraved in relief, or sunk below the surface on the public monuments and objects of hard materials suited for the glyptic art, or else traced in outline with a reed pen on papyri, wood, slices of stone, and other objects. The scribe, indeed, wrote from a palette or canon, called *pes*, with pens, *kash*, from two little ink-holes in the palette, containing a black ink of animal charcoal, and a red mineral ink. The hieroglyphs on the monuments are sometimes sculptured and plain; at others, decorated with colors, either one simple tone for all the hieroglyphs, which are then called monochrome; or else ornamented with a variety of colors, and then called polychrome; and those painted on coffins and other objects are often first traced out, and then colored in detail. On the papyri and some few inferior materials they are simply sketched in outline, and are called linear hieroglyphs. The hieroglyphs are arranged in perpendicular columns, separated by lines, or in horizontal, or distributed in a sporadic manner in the area of the picture to which they refer. Sometimes all these modes of arrangement are found together. One peculiarity is at once discernible, that all the animals and representations face in the same direction when they are combined into a text; and when mixed up with reliefs and scenes, they usually face in the direction of the figures to which they are attached. When thus arranged, the reliefs and hieroglyphs resemble a MS., every letter of which should also be an illumination, and they produce a gay and agreeable impression on the spectator. They are written very square, the spaces are neatly and carefully packed, so as to leave no naked appearance of background. Generally they are to be read from the direction in which they face, and the lines follow in

the same succession, but many exceptions occur, in which they follow the reverse order, whether written horizontally or vertically, and this at all periods.

The hieroglyphs, in their nature, are divided into two great classes—*ideographs*, or those which represent ideas; and *phonetics*, or those which express sounds. No doubt, at the first commencement of the language, ideographs only were employed; but the earliest known monuments, which ascend to the 3d dynasty above 2,000 years B.C., are filled with phonetic hieroglyphs, showing that at that early period the principle of writing sounds had been completely developed. These hieroglyphs, at the most developed period of the language, comprised about one-third of the texts. The ideographs are divided into two classes—the simple ideographs, or those which express one idea; and the determinatives, which are used to indicate many. In all instances, these ideographs are occasionally found preceded by phonetic groups, which give the sound of the idea they are intended to express in the written language; the simple ideographs being found only preceded by one group; while the determinatives are preceded by many. The pure ideographs are of various classes: first, those representing the object directly; secondly, those metaphorically conveying the required meaning, as a woman beating a tambourine to indicate "joy," in which the action indicates the effect produced; thirdly, that in which the attribute is expressed by the figure of some object possessing it, as a jackal, to indicate "cunning" or "craft;" a flaming censer, to signify "incense." Or the direct action was often represented; as a bird fishing, to express the idea of fishing in general. Such a mode of depicting ideas in detail was only suited for elaborate monuments; and the number of ideographs required to express all ideas would have been so many as to have overwhelmed the memory of the learner, and to have obscured the comprehension of the reader. In order, therefore, to reduce the number of *ideographs*, a certain number of these hieroglyphs were used to express more ideas than one in the principal classes of thought. Thus, a seated man, originally employed to signify man, was applied to all relationships, functions, and offices of men, as *atf*, father; *sen*, brother; *mer*, governor; *hentneter*, priest; *bak*, laborer: the special meaning which it conveyed being shown by the phonetic groups which preceded it. In the same way, all beasts or objects made of leather were expressed by a skin; all precious stones or objects made of the same by a ring; all actions of locomotion by two legs in the act of walking; and all actions in which the arms were used by an arm holding a stick. The number of these signs may be computed at about 175, and they resemble in their use those of the Assyrian cuneiform, in which, although to a more limited extent, the leading classes of thought were determined by a character prefixed to the phonetic group giving the particular idea. Thus, in the Assyrian, all names of men are preceded by a single upright wedge; all countries by three wedges disposed obliquely; and names of horned cattle by a group of five wedges. In the Egyptian system, however, the determinatives are always placed after the phonetic groups, and are more numerous. The Chinese system of writing approaches still more closely to the Egyptian, 242 radicals, as they are called, but really determinatives, being placed after other groups and symbols, which indicate the special idea intended. In this last language, the radicals are generally placed to the left. In the Egyptian hieroglyphs, every word not expressing an abstract idea, as the verb to be, or the grammatical forms, and pronouns, is accompanied by its determinative, and is incomplete without it. The genius of the writing is that the phonetics and ideographs mutually explain each other. Sometimes, indeed, by a kind of redundant pleonasm, the determinatives are placed after the special ideographs, as three rings of metal after a cape used to express gold and silver; three flowers after the lily, to signify lily; and the skin after the goat, to mean goat. The phonetic portion of the hieroglyphs consists, at the best period of writing, of a limited number of signs, about 130, employed as a syllabarium; and although the term alphabet has been often used in speaking of the phonetic hieroglyphs, nothing of the nature of a pure alphabet existed till a later period, when the Phenicians invented a purely alphabetic system, suppressing the vowels, which the Greeks still further improved by reintroducing them into their graphic system, and so brought to perfection the invaluable invention of alphabetic writing, at once concise, compendious, and complete. But the Egyptian hieroglyphs comprise two classes of syllables—those ending with vowels, or the so-called alphabetics, and those ending with consonants; or, in other words, of monosyllables and polysyllables. As the monosyllables enter into the composition of the polysyllabic groups, it is evident that they are older than the biliteral or dissyllabic hieroglyphs. The spoken language seems, in fact, to have originally consisted of monosyllables, which were subsequently enriched by agglomeration, and combined into biliteral and triliteral roots. Several of these monosyllabic words have descended from the ancient language to the Coptic, as *ab*, a lamb; *au*, a cow; *mau*, a lion; *ra*, the sun; *pe*, the heaven. Numerous words of this class may still be traced as the roots of the more ancient language, but it is obvious that only a few of the most manageable could be selected for the combined purposes of sound and writing. In some instances, two or more seem to have been selected for the same sounds, in order to suit the style of writing, horizontal or vertical signs being required for the careful packing of the groups in the texts. Now, it will be necessary to bear in mind that each of these hieroglyphs of the first phonetic division represents a monosyllable; of which it represents the whole by itself considered as the initial, but that it was always capable of having the vowel

hieroglyph which followed the initial placed after it, and that in the hieratic or cursive Egyptian writing this was generally the case in order to distinguish the signs. This final vowel is, however, generally omitted in hieroglyphic texts, and is said to be *inherent*, or ought to be pronounced in the first hieroglyph. The alphabetic syllabarium is as follows:

an eagle, A*a*.
an arm, Â*a*.
a reed, Au.
a calf, Au.
a heron, Ba.
a leg, Bu.
a cerastes, Fi.
an eaglet, Ga.
a vase, Ga.
a viper, Gi.
leg of a stool, Ha.
a house, Ha.
a sieve, KHi.
a garment, KHu, or Au.
a lion, Ru, or Lu.
a mouth, Lu, or Ru.
a pen, Ma.
a weight, Ma.
a hole, Mâ.
an owl, Mu.
a vulture, Mu.
a water-line, Na.
a red crown, Na.
a vase, Nu.
a goose flying, Pa.
a shutter, Pu.
a knee, Qa.

a papyrus plant, Ha.
fore-part of lion, Hâ.
twisted cord, Hi.
a tusk, Hu.
a club, Hu.
two reeds, Iu.
two oblique strokes, Iu
a bowl, Kâ.
leaf of water-lily, KHa.
a mormorus fish, KHa.
a mace, KH*a*.
a stand, Qa.
top of quiver, Sa.
a goose, Sa.
a woof, Sa.
a reed, Su.
a bolt, Su.
back of chair, S(en or -et).
a garden, SHa.
part of dress, SHa.
a pool, SHi.
a spindle, Ta.
a hand, Ti.
twisted cord, Ti.
a muller, Tu.
a duckling, Ui.
a twisted cord, Ui.

This comprises all the signs which may be considered alphabetic in their nature, at the best period, or from the 4th to the 21st dynasty, when a revolution took place in the mode of writing, and about 90 additional signs, taken from the ideographs and syllabics, were added to the preceding alphabetic, and used indiscriminately—not, indeed, all at once, but by gradual introductions, from the 21st dynasty till the 2d c. A.D. Nor are all the signs of the preceding alphabet of equal antiquity, or as much used as others. As to the inherent nature of the vowels, it may be observed that A, the commonest, is often written with its complement *u* after it. Of the three forms of the A, the first expresses the aspirate, the second the nasal, and the third the soft breathing. Besides, too, their final complement, the initial sound, especially of consonants, probably of those newly introduced into the system, was placed before them, to explain their use. The consideration of the signs that precede and follow after indeed determines the sonal value of certain hieroglyphics which are thus encased and explained by other phonetics.

The syllabics are constructed on the same plan. They consist of an initial hieroglyph, which is capable of expressing by itself the whole syllable, but which take after them their inherent consonant or complement, and are sometimes preceded by their initial complement. These are more numerous than the alphabetico-syllabic class, and are as commonly used in the texts. The language had impressed upon it by this mode of writing a certain ideographic character, which it retained, certain words being only written by certain syllabics, and the use of the two syllabaries was by no means promiscuous, the examples of different modes of grouping the same word being abnormal, and referable only to long intervals of time. For although several hundred papyri exist in the museums of Europe, and no two are written precisely alike, yet the greatest differences will be observable in those which are similar texts, written at long intervals of time from each other. Nevertheless some latitude prevails in the writing of certain words and propernames, and those hieroglyphs which appear in the corresponding places of others are called *variants* or *homophones*. Sometimes the same proper name is represented by six different groups of hieroglyphs, yet they could only have been pronounced in one way, as they represent the same name, and the different hieroglyphs are consequently only interchanged to express the same sounds.

The *language* of the hieroglyphs is nearest to the Coptic, the form which it assumed about the 3d c. A.D., when the Greek alphabet, reinforced by letters borrowed from the

demotic or popular cursive hand of the period, superseded the demotic and hieroglyphic mode of writing. This language, extinct only as spoken about a century and a half ago (see COPTIC), differs considerably from the monumental texts, having been corrupted by the introduction of Greek, Latin, and Arabic words, but this contains, as its base, the old language of the country—a tongue analogous in some respects to the Semitic dialects, but in others of a construction which may be called Hamitic, or allied to the African. The great peculiarity of the hieroglyphic language is that the verbal root both of the nouns, adjectives, and verbs remains unchanged, and that the dual and plural are made by postfixes, the cases of the nouns formed by prepositions, and the tenses of the verbs by the prefixing of the declined abstract auxiliary verbs, au, an, or kheper, to be; or by the affixing of the pronouns *a, k, t, f, s, nen, ten, sen*, preceded by prepositions, to the verbal roots. The pronouns are either detached and prefixed or affixed, and the prepositions are either simple or compound; many remarkable forms of the last class existing in the language. There is a great vagueness in their employment, and their meaning is often abnormal, and only defined by the context.

Considered as the most ancient written language, the hieroglyphs throw great light upon comparative philology, the relative antiquity of various words and locutions, the general construction of language itself, and the development of picture-writing into the abstract ciphers of sound, called letters. A great portion of the words are similar to the Semitic, either directly or indirectly: thus *iuma*, the sea, is like the Hebrew *yam; kaf*, an ape, like *qof*. The majority are, of course, purely Coptic; but at the period of the 19th dynasty, or about 1300 B.C., many Hebrew, Syriac, and Aramaic words were introduced into the language by the progress of the Egyptian arms to the east, and such words as *bata* for *beth*, a house, *makaturu* for *migdol*, a tower, and others, appear; they are, however, rare and few in number compared to the body of the language. Many other words appear to be Indo-Germanic. The literature will be found under the word PAPYRUS.

The invention of hieroglyphs, called *neter kharu*, or "divine words," was attributed to the god Thoth, the Egyptian Logos, who is repeatedly called the scribe of the gods, and lord of the hieroglyphs. Pliny attributes their invention to Menon. The literature of the Egyptians was in fact styled hermaic or hermetic, on account of its supposed divine origin, and the knowledge of hieroglyphs was, to a certain extent, a mystery to the ignorant, although universally employed by the sacerdotal and instructed classes. To foreign nations the hieroglyphs always remained so, although Moses is supposed to have been versed in the knowledge of them (*Philo*, vita Moysis); but Joseph is described as conversing with his brethren through interpreters, and does not appear to allude to hieroglyphic writing. The Greeks, who had settled on the coast as early as the 6th c. B.C., do not appear to have possessed more than a colloquial knowledge of the language; and although Solon, 538 B.C., is said to have studied Egyptian doctrines at Sebennytus and Heliopolis, and the doctrines of Pythagoras are thought to have been derived from Egypt, these sages could only have acquired their knowledge from interpretations of hieroglyphic writings. Hecatæus (521 B.C.) and Herodotus (456 B.C.), who visited Egypt in their travels, obtained from similar sources the information they have afforded of the language or monuments of the country. Democritus of Abdera indeed, about the same period (459 B.C.), had described both the Ethiopian hieroglyphs and the Babylonian cuneiform, but his work has disappeared. After the conquest of Egypt by Alexander, the Greek rulers began to pay attention to the language and history of their subjects, and Eratosthenes, the keeper of the museum at Alexandria, and Manetho, the high-priest of Sebennytus, had drawn up accounts of the national chronology and history from hieroglyphic sources. Under the Roman empire, in the reign of Augustus, one Chæremon, the keeper of the library at the Serapæum, had drawn up a dictionary of the hieroglyphs; and both Diodorus and Strabo mention them and describe their nature. Tacitus, later under the empire, gives the account of the monuments of Thebes translated by the Egyptian priests to Germanicus; but after his time the knowledge of them beyond Egypt itself was exceedingly limited, and does not reappear till the 3d and subsequent centuries A.D., when they are mentioned by Ammianus Marcellinus, who cites the translation of one of the obelisks at Rome by one Hermapion, and by Julius Valerius, the author of the apocryphal life of Alexander, who gives that of another. Heliodorus, a novelist who flourished 400 A.D., describes a hieroglyphic letter written by queen Candace (iv. 8). The first positive information on the subject is by Clement of Alexandria (211 A.D.), who mentions the symbolical and phonetic, or, as he calls it, cyriologic nature of hieroglyphics. Porphyry (304 A.D.) divides them also into cœnologic or phonetic, and enigmatic or symbolic. Horapollo or Horus-Apollon, who is supposed to have flourished about 500 A.D., wrote two books explanatory of the hieroglyphs, a rude, ill-assorted confusion of truth and fiction, in which are given the interpretation of many hieroglyphs and their esoteric meaning. After this writer, all knowledge of them disappeared till the revival of letters. At the beginning of the 16th c., 1529 A.D., these symbols first attracted attention, and soon after Kircher, a learned Jesuit, pretended to interpret them by vague esoteric notions derived from his own fancy, on the supposition that the hieroglyphs were ideographic, a theory which barred all progress, and was held in its full extent by the learned, till Zoega, at the close of the 18th c., 1787 A.D., first

enunciated that the ovals or cartouches contained royal names, and that the hieroglyphs, or some of them, were used to express sounds. More monuments were known, and juster ideas had begun to dawn on the European mind; and the discovery by the French, in 1799, of the so-called Rosetta stone, a slab of black granite having inscribed upon it, first in hieroglyphics, secondly in demotic or enchorial (a cursive popular form of writing extant at the period), and thirdly in Greek, a decree of the priests of Egypt assembled in synod at Memphis in honor of Ptolemy V., gave the first clue to the decipherment. The first attempts, indeed, were made upon the demotic text by Silvestre de Sacy with some success, but it was soon discovered that the demotic was not purely alphabetic. Crude notions of the ideographic nature of the hieroglyphs prevailed till Dr. Young, in 1818, first gave out the hypothesis that the hieroglyphs were used as sounds in royal proper names. He was led to this conclusion by tracing the hieroglyphs through the cursive hieratic to the more cursive demotic; and as this last was known to be alphabetic, he deduced that the corresponding hieroglyphic signs were so. In this manner, he came to the conclusion that the first hieroglyph in the name of Ptolemy in the Rosetta stone (a mat) represented a P; the second (hemisphere) a T; the third (a loop) he supposed to be superfluous; the fourth (a lion) he read OLE; the fifth and sixth, the syllable MI; and seventh, the back of the seat, an S. Unaided by bilingual monuments, he essayed to decipher the name of Berenice, and altogether established the value of five hieroglyphs as letters out of two names, but was unable to proceed further. Champollion, in 1822, by means of an inscription found on an obelisk at Philæ, which had at the base a Greek inscription, recognized the name of Cleopatra, and by comparison with that of Ptolemy at once proved the purely alphabetic, not syllabico-alphabetic, nature of the signs. Extending the principle, he read by its means the names of the Greek and Roman and finally those of the native monarchs. It was soon seen that the same hieroglyphs as those used in these names were extensively used in the texts for words, and these words turned out, in most instances, to be analogous to the Coptic. Although the discoveries of Champollion were received by many of the learned in Europe with distrust, yet his method of research was slowly adopted by Rosellini and Salvolini in 1832, and subsequently extended methodically by Lepsius in 1837, and by Bunsen, Hincks, De Rougé, Birch, Goodwin, Chabas, Brugsch, and others.

The method of interpretation adopted has been strictly inductive, the value of the characters being deduced from the equation of sounds, or homophones of similar groups. The meaning of the groups or words has been determined by examining all known instances in which they occur in passages capable of being interpreted, that of the ideographs by observing the form of the symbols; many of them have been made out from the pictures which they explain, or the phonetic groups which accompany them. A careful comparison has been instituted with corresponding Coptic and Hebrew roots when they exist. In short, a careful principle of induction has been applied to the study of the hieroglyphs.

The discovery of another trilingual inscription, that of the tablet at San or Tunis, recording a synodical act of the priests in the reign of Ptolemy Euergetes II., B.C. 238, has confirmed the results obtained by Egyptologists, the meaning of almost all the words having been previously determined; while the power of reading all documents and inscriptions afforded by their researches has resulted in the resuscitation of a knowledge of the history, science, and literature of the ancient Egyptians. The study has long passed into the category of a recognized branch of oriental learning, and the researches have assumed a more critical form. This has been owing to the number of students and the abundance of material extant and published. The doubts with which the interpretations were at first received have succumbed to the conviction that nothing but a current system of interpretation could have obtained such logical results. Whatever doubt, in fact, may exist as to the minor details and more delicate shades of language, all the grammatical forms and three-fourths of the words of the old Egyptian language have been established.

The hieroglyphs stood in the same relation to the other two forms of writing the character, called hieratic and demotic, as type does to handwriting. Their use was chiefly for official inscriptions on public or private monuments, religious formulæ, and prayers, and rituals or hermetic books (see PAPYRUS). The most remarkable hieroglyphic inscriptions are: that of Una, recording the conquest of the lands of the negroes at the time of the 6th dynasty; in honor of Khnumhetp at Benihassan, recording the investment of his family; the campaigns of Ahmes against the Hykshos at El-Kab; the annals of Thothmes III. at Karnak, the campaign of Rameses II. against the Khita, and the treaty with them; the account of the tank for gold-washings in the reign of Seti I. and Rameses II. at Kouban and Redesieh; the invasion of Egypt in the reign of Meneptah by the allied forces of the Libyans, Maxyes, Achaioi or Greeks, Sicilians, Etruscans, Lycians, and other people of the basin of the Mediterranean; the star-risings on the tomb of Rameses V.; the journey of the ark of Khons to Bakhtan, in the reign of Rameses X.; the account of Cambyses and Darius on the statue of the Vatican; the already-cited synodical act of the priests in honor of Ptolemy Euergetes II., and that of the priests assembled at Memphis on the Rosetta stone in the reign of Ptolemy V., the sepulchral tablets of the family of Pasherenptah, and the long series of sepulchral

tablets of the bull Apis found in the Serapeion, recording the birth, installation, and death of the bulls from the 18th dynasty to the Persians.

In connection with the hieroglyphics are two modes of writing them, first the *hieratic* writing, consisting of a kind of abridged hieroglyphs. The number of these written characters is fewer than that of the hieroglyphs, the generic determinatives being more employed, and the vocalic complements of the consonants being constantly written, in order to distinguish similar forms. This writing was more extensively used than the hieroglyphic, being employed for state papers, legal documents, memoranda, accounts, religious books, rituals, and all the purposes of private and public life. Books were generally written in hieratic. It commences as early as the 4th or 5th dynasty, and terminates only about the 3d or 4th c. of our era. At the earliest period, it is occasionally written perpendicularly, but it was afterwards only written horizontally, and has generally portions in red ink, corresponding to our initial illuminated letters or rubrics. For the literary contents of these rolls, see PAPYRUS. Some, indeed, have supposed that the hieratic alphabet gave rise to the Phenician, and have endeavored to trace the Phenician alphabet from hieratic sources. But although much ingenuity has been expended in this inquiry, the precise source of Phenician writing remains involved in obscurity, the principal fact being that a syllabary existed long prior to the Phenician alphabet, which did not reach the perfection of the Greeks, owing to the suppression of vowels. The second kind of hieroglyphic handwriting was the *demotic*, or so-called enchorial. It was a still further reduction of the hieratic, simpler forms being used, while the complements are not used, and it approaches still nearer the alphabetic system. It contains an alphabet of 42 letters and a syllabary of 48 characters, and is less rich in the number of determinatives and ideographs than the hieratic. It is, like all cursive hands, more difficult to decipher than the hieratic. It was introduced into the Egyptian graphic system about the commencement of the 26th dynasty, or the 6th c. B.C., and continued in use till the 3d c. A.D. This was the last native form of writing in Egypt, the early Christians having introduced the Greek alphabet, with a few characters borrowed from the demotic. This script is rarely used for public monuments, although it appears on the Rosetta stone; but it was universally employed for contracts, public documents, and occasionally for religious formulæ, owing to the decreasing knowledge of hieroglyphics. At the time of Clement, it was the first learned by beginners. With it the Greek language began to appear in public use.

Besides the Egyptian hieroglyphics there are those of the Aztecs or Mexican, which were a kind of pure picture-writing, the names of monarchs, towns, and other things being painted by the objects which corresponded to their names. While in their historical writings the events themselves were portrayed, the number of the years of the reign of the king was indicated by placing in a line *en potence* in the picture the symbols of the years of the Aztec cycle, which were named after plants and animals. The Mexican hieroglyphs, in fact, consisted of conventional pictures, and they had no means of expressing grammatical form or any structural parts of a language. This mode of pure picture-writing prevailed not only in Mexico, but amongst the nations of Central America. The knowledge of these symbols has unfortunately been almost lost since the Spanish conquest, the meaning of only a few having been rescued from oblivion in the 16th c., when the greater part of the Aztec MSS. was destroyed by the Spanish ecclesiastics. It has indeed been asserted that the monks used these symbols, according to their *sounds*, to write the Lord's prayer and other formulas; thus a flag, pronounced *pantli*, was used for the syllable *pa;* a stone, *tetl*, for *tĕ*, the two expressing *pater;* a cactus-fruit, *nochtli*, for *noch;* and a stone, as above, for *te:* these four groups expressing *pate*(r) *nochte*, or *noster;* and so forth. This seems to show the development of a phonetic system, but it was never extensively used on account of the abhorrence entertained of the Aztec idolatry.—The term hieroglyphic was also used by the writers of emblemata or devices, symbolizing gnomic sentences taken from the Greek and Latin poets, and having no relation to Egyptian hieroglyphs.—In recent times, too, the astrological almanacs have had their symbolical representations and supposed prognostics of future events, which they called hieroglyphs.—Zoega, *De Origine Obeliscorum* (fo. Romæ, 1797); Young, *Archæologia* (1817, vol. xvii. p. 60); *Encyclop. Britannica* (8th ed.); Champollion, *Précis du Système Hieroglyphique* (1824); *Grammaire Egyptienne* (1841–61); *Dictionnaire* (1841); Lepsius, in the *Ann. dell' Instituto Arch.* (1828); Birch, *Introduction to the Study of the Hieroglyphics* (1857); Brugsch, *Grammaire Démotique* (Berl. 1855), *Wörterbuch* (1867–68), *Grammatik* (1872); De Rougé, *Étude d'une Stèle Égyptienne* (1858); Chabas, *Papyrus Magique d'Harris* (1861); *Zeitschrift. f. ägypt. Sprache* (1863–74); Bunsen, *Egypt's Place* (vol. v. 1867).

HIERON'YMITES, one of the many hermit orders (q.v.) established in the course of the 13th and 14th centuries. The Hieronymites grew out of the third order of St. Francis. See FRANCISCANS. Some of the followers of Thomas of Siena, one of the Franciscan rigorists, having established themselves in various places among the wild districts which skirt the Sierra Morena, by degrees formed into a community, and obtained in 1374 the approval of pope Gregory XI., who confirmed their rule, which was founded on that of St. Augustine. The institute extended into other provinces of Spain, and also into Portugal; it was subsequently established in Italy, Tyrol, and Bavaria.

HIERONYMUS, King of Syracuse, grandson of Hiero II., succeeded to his grandfather at the age of 15, 216 B.C. Up to this time a close friendship had subsisted between the Romans and Syracusans. But the battle of Cannæ, in which the Romans were so terribly defeated, disposed many of the Syracusans to join the Carthaginians. Hiero II. had appointed 15 guardians, including Andranodorus and Zoippus, to guide the young prince, but through the intrigues of Andranodorus, who was favorable to the Carthaginians, the guardians were all induced to resign their office. The young prince was now entirely under the influence of Andranodorus and Zoippus, who were sons-in-law to Hiero II. Communications were at once opened up with Hannibal. The Carthaginian envoys were received with great favor, whereas the Roman envoys were treated with contumely. Hieronymus was preparing to take the field against the Romans with 15,000 men, when he was assassinated in Leontini by conspirators under Deinomenes. His short reign of one year and one month was disgraced by indulgence in luxury, debauchery, and cruelty.

HIERONYMUS. See JEROME, *ante*.

HIEROPHANT, or MYS'TAGOGUE, the priest who presided over the mysteries at Eleusis, was always selected from the family of Eumolpus, who was regarded as their founder, and the first hierophant. The hierophant was required to be a man of ripe years, without any physical defect, endowed with a fine voice, and of spotless character. He was forbidden to marry, but it is not improbable that married men were likewise appointed hierophants, and were merely prohibited from forming a second marriage. In the mysteries the hierophant represented the demiurge or creator of the universe. He alone was authorized to preserve and explain the unwritten laws, to introduce candidates into the temple at Eleusis, and gradually initiate them into the lesser and greater mysteries. On this account, he was likewise styled *mystagogue* and *prophet*, and no one was allowed to utter his name in the presence of an uninitiated person. At public solemnities he carried the image of the goddess splendidly attired.

HIESTER, JOSEPH, 1752–1832; b. Penn.; a merchant. In the war of the revolution he raised, armed, and led a volunteer company. He was wounded in the battle of Long Island, captured and confined on board the prison-ship *Jersey*. He was in congress for 14 years, and in 1821–23 was governor of his state.

HIGGINSON, FRANCIS, 1588–1630; b. England; educated at Cambridge, and was a rector in Leicester, but was deprived of his benefice for non-conformity. Arriving at Salem, Mass., in 1629, he became teacher of the congregation at that place. He wrote *New England's Plantation, or a Short and True Description of the Commodities and Discommodities of the Country*, and also an account of his voyage.

HIGGINSON, JOHN, 1616–1708; son of Francis, b. England. He accompanied his father to Massachusetts, and settled as a preacher in Guilford, Conn. In 1660 he was pastor of the First church in Salem, and passed the remainder of his life there. He was 72 years in the ministry.

HIGGINSON, THOMAS WENTWORTH, b. Mass., 1823; a descendant of Francis Higginson, graduated at Harvard college in 1841, and at the divinity school in Cambridge in 1847; after which he became the minister of the "First religious society" in Newburyport. His antislavery principles offended a part of his congregation, causing him to resign in 1850. Two years later he became minister of a "free church" in Worcester. He was the leader of the men who in 1853 attempted to effect the rescue of Anthony Burns, a fugitive slave confined in the court-house in Boston, in custody of the U. S. marshal. The attempt was unsuccessful, and he was wounded in the face by a saber cut. One of the marshal's men having been killed in the fray, Mr. Higginson was indicted for murder, but not convicted. In 1856 he went to Kansas and took an active part in the measures by which that state was prevented from becoming an abode of slavery. He now relinquished the ministry to devote himself to literature, but on the breaking out of the war of the rebellion he exerted himself to procure enlistments, and entered the service with the rank of capt. In 1862 he was appointed col. of the first regiment of South Carolina volunteers, the first regiment of emancipated slaves that entered the service. He led this regiment for two years, making various expeditions within the confederate lines, and capturing Jacksonville, Fla. In Aug., 1863, he was wounded, and in 1864 was compelled on that account to retire from the service. He then took up his residence at Newport, R. I., and resumed the literary labors which had been interrupted by the war. Since that time he has published *Outdoor Papers; Harvard Memorial Biographies; Malbone, an Oldport Romance; Army Life in a Black Regiment; Atlantic Essays; Oldport Days;* and a new translation of Epictetus. In 1878 he removed to Cambridge, Mass., where he still resides. He represented that city in the general court in 1880. He has been for many years a very earnest advocate of woman suffrage.

HIGH ALTAR. See ALTAR.

HIGH BAILIFF, is a term applied to some officers in England, who discharge ministerial duties, such as serving writs, etc., in certain liberties or franchises, exempt from the ordinary supervision of the sheriff. The term is used in contradistinction to the

ordinary name of bailiff, which is now almost a term of reproach, and confined chiefly to the lowest class of officers, who execute writs against debtors.

HIGH COMMISSION COURT, a tyrannical court established by queen Elizabeth to reform the church, abolished by 16 Ch. I. c. 11.

HIGH CONSTABLE. See CONSTABLE.

HIGH GATE, a northern suburb of London, in the county of Middlesex, and a station on the Highgate and Edgeware railway, 5 m. n.n.w. of St. Paul's. It comprises many elegant villas, and some important benevolent institutions. On the slope of a hill below the church of Highgate is the North London cemetery. New buildings for the Highgate grammar-school were erected in 1867.

HIGHLAND, a co. in s.w. Ohio, on the Marietta and Cincinnati railroad; 475 sq.m.; pop. '70, 29,133. The surface is generally level, and to a large extent covered with timber. The soil is fertile; main products: corn, wheat, oats, and pork. Co. seat, Hillsborough.

HIGHLAND, a co. in w. Virginia, bordering on West Virginia, watered by affluents of the Potomac; 450 sq.m.; pop. '70, 4,151—348 colored. Surface rough, being invaded by a range of the Alleghany mountains. The valleys are fertile, producing corn, wheat, etc. Co. seat, Monterey.

HIGHLAND REGIMENTS. The origin of the first of these regiments, the 42d, has been given under the head black watch (q.v.). The valuable services of this regiment encouraged the government to augment the force; and accordingly seven other Highland regiments have been raised from time to time—viz., the 71st, in 1777; the 72d, or Duke of Albany's Own, in the same year; the 74th, in 1787; the 78th, or Ross-shire Buffs, in 1793; the 79th, or Cameron Highlanders, in 1805; the 92d, or Gordon Highlanders, in 1796; and the 93d, or Sutherland Highlanders, in 1800. The uniform of each of these corps is the Highland dress, including a distinctive tartan. The soldier wears a coatee of scarlet, a kilt (in most, but not all, of the regiments), a plaid across the shoulders, a plume, and the other attributes of the Gaelic costume. In an army where officers are appointed by general competition, nationality is necessarily disregarded; but these corps are those in which Scotch gentlemen most frequently seek appointments, and a large proportion of the officers are Scotch. Of the men, about 79 per cent are Scotch, 11 per cent English, and 10 per cent Irish. The regiments are recruited at Stirling, Aberdeen, Perth, fort George, and Lanark.—See *History of the Highland Clans* (Fullarton).

HIGH LANDS, a term generally applied to the higher parts of a country, as, for example, Highlands of the Hudson, as defining a certain high and picturesque region on the river Hudson, in the state of New York; but the term has a more special application to a particular district in Scotland. This district has no political or civil boundary. Separated by only a vague line of demarkation from the division called the Lowlands, the Scottish Highlands may be briefly described as that portion of the n. and n.w. of Scotland in which the Celtic language and manners have less or more lingered until modern times. The Highland line, as it is usually called, extends diagonally across the country from Nairn on the Moray firth to Dumbarton on the Clyde; but the mountainous part of the counties of Banff, Moray, Aberdeen, Kincardine, and Perth are also understood to be included in the designation Highlands. Caithness might be excluded as being a generally level country; but throughout the Highlands there are rich level tracts, none being more so than the eastern division of Ross-shire. The Hebrides (q.v.) or Western isles are included in the Highlands, but the isles of Orkney and Shetland, though to the n., are distinctly excluded, by reason of the Norwegian origin of the inhabitants.

The Highlands are full of lofty hills, some green and pastoral with tracts of heath, and others rugged and bare, varying in height from 1000 to 4,000 ft., and having generally narrow valleys between, or else lakes and arms of the sea, called *lochs*. Besides the grander features, there are impetuous mountain torrents, picturesque ravines, and valleys or glens, in which, and on the sides of the hills, are seen the huts of the aborigines. Perhaps the most remarkable feature in the country is the line of valleys from Inverness to fort William, in which lies a series of navigable lochs, united by artificial channels to form the Caledonian canal. Growing up under a system of clanship, the state of society in the Highlands was antiquated and unsatisfactory, in a national point of view; while the country was almost impenetrable to travelers, or to any species of traffic. The first great attempt to reform this state of affairs was the opening up of the country by roads in different directions, under the superintendence of gen. Wade, about 1725–26. The next great act of melioration was the abolition of heritable jurisdictions (q.v.), including the ancient privileges of the heads of clans, about 1748. And lastly, not to speak of the planting of schools and churches, much was done by the establishment of the Highland and agricultural society in 1784. Since these events, the ancient patriarchal system has given place to improvements as regards communications, agriculture, dwellings, education, and other modern conditions, including a gradual substitution of English for the Gaelic language. Latterly, there has been a keen spirit of progress in the Highlands. Great numbers of the Celtic inhabitants, who had little chance of improving their circumstances on the spot, have been dispossessed, and their

place taken by stock-farmers with capital from the Lowlands. See SUTHERLAND. While a new character has thus been given to extensive Highland pasturages, the value of estates has been further and very remarkably advanced by being let for the pursuit of game to sportsmen, chiefly persons of rank and opulence from England. What, therefore, with improved farming and shootings, Highland estates have of late years risen immensely in value. Inverness is usually spoken of as the capital of the Highlands, and is noticed under its proper head. The Highland counties are also noticed individually. There are sundry popular guide-books for tourists in the Highlands; and for minute topographical and other details, we may refer to the *Guide to the Highlands and Islands of Scotland*, by G. and P. Anderson, Lond. 1834; 4th ed. 1863.

HIGHLANDS OF THE HUDSON, a range of hills and mountains, seemingly a continuation of the Blue Ridge of Virginia, connecting with and including the Palisades, appearing e. of the Hudson river in the vicinity of West Point, and extending with gradually lessening elevations to the Green mountains of Vermont. In their course there may be found much splendid scenery.

HIGH MISDEMEANOR, an offense short of, but closely bordering on, treason.

HIGHNESS, a title of honor given to princes. The titles "your highness" and "your grace" were both used in England in former times in addressing the sovereign, but were supplanted by "your majesty" towards the end of the reign of Henry VIII. The children of royal personages are addressed "your royal highness;" those of emperors, "your imperial highness." The sultan of Turkey is addressed as "your highness."

HIGH PLACES (Heb. *bamoth*), the name given in Scripture to certain places where illicit worship was performed by the people of Israel. The practice of erecting altars on elevated situations was common in ancient times, and originated in the belief that hill-tops were nearer heaven, and, therefore, the most favorable places for prayer and incense. The fathers of the Jewish nation acted in this respect just like their neighbors. Abraham, we are told, built an altar to the Lord on a mountain near Bethel. The Mosaic law, however, true to its grand aim of securing national strength and purity by a vigorous system of isolation, prohibited the practice for the future, on the ground that the spots which the Israelites would be compelled to choose had been already polluted by idolatrous services. In spite of the vehemence with which the high places are again and again denounced in the Pentateuch, the prohibition seems to have been a long time in producing the desired effect—if, indeed, it ever really accomplished it. During the whole eventful period of the judges, it was not only practically obsolete, but we actually find that both Gideon and Manoah built altars on high places by divine command (Judges, vi. 25, 26; xiii. 16–23. It also occasions much surprise to read of the violations of the injunction —among others by Samuel at Mizpeh and Bethlehem, by Saul at Gilgal, by David, by Elijah on Mt. Carmel. The explanations given by the rabbis of these contradictions between the conduct of the prophets and kings of the Hebrew people, and the commands of their great lawgiver, are too absurd for mention. Whatever may be the true explanation, it is quite certain that worship in high places was almost universal in Judea, both during and after the time of Solomon. The results were such as might have been anticipated. The people erected altars not only to Jehovah but to Baal, and from worshiping in idolatrous places, proceeded to worship idols themselves. At a later period (see books of Kings and Chronicles) a series of vigorous efforts was made by the more pious monarchs to suppress the practice, and after the time of Josiah, it seems to have been finally abandoned.

HIGH-PRIEST (Heb. *kohen haggadol*, or emphat. *kohen*, Gr. *archiereus*, Lat. *primus pontifex*, etc.), the chief of the Jewish priesthood. His dignity was hereditary in the line of Eleazar, the son of Aaron, and many more restrictions attached to it than belonged to the ordinary office of a priest. He was only allowed to marry an intact virgin, and one of his own tribe; every impure contact even of the dead bodies of his own parents he was strictly forbidden, besides having to abstain from many other things that might cause any defilement whatever. His functions consisted principally in the general administration of the sanctuary and all that belonged to the sacred service. He alone was allowed to enter the holy of holies on the day of atonement, and to consult the urim and thummim (q.v.). No less was his costume of surpassing costliness and splendor, comprising numerous vestments in addition to those of the ordinary priests. This brilliant costume, however, was laid aside by the high-priest when, on the day of atonement, he went to perform the most awful service in the holy of holies: a simple garb of white linen—the funeral dress of the Jews in later times—was all he wore on that occasion. The revenues of the high-priest were in the main the same as those of the other priests; but, according to the Talmud, he was to be richer than these, and if his own means were insufficient, he was to be provided with opulent means by his brethren, in virtue of his exalted position: the other priests never addressed the high-priest but by *ishi kohen gadol*, "my lord high-priest." Before the law, however, the high-priest was equal to any other Israelite. It is doubtful at what time the office of *sagan*, or vice-high-priest, was created. The Talmud, moreover, speaks of a

mashiach milhamah, "anointed for the war," an officer who seems to have shared almost the dignity of the high-priest, and whose special duty it appears to have been to read the proclamation prescribed in Deut. xx. 3, in the time of war, and who may have accompanied the troops for the purposes of celebrating the service in the camp. For further historical and theological points connected with this subject, see PRIESTS, AARON, and JEWS.

HIGH SEAS, i.e., the open sea, including the whole extent of sea so far as it is not the exclusive property of any particular country. The rule of international law is that every country bordering on the sea has the exclusive sovereignty over such sea to the extent of three miles from its shore; but all beyond, and which is not within three miles of some other country, is open or common to all countries. The part of sea within three miles' distance is generally called the territorial sea of the particular country, or *mare clausum*. The distinction has little effect on the right of navigation, but as regards fishing it is otherwise. Thus, for example, foreign fishermen have no right to fish within three miles of the British coast without a license from the crown, or unless some special treaty—as, for example, the French and English treaty—has laid down other arrangements.

HIGH STEWARD, a judge now always a legal peer, who is specially appointed by the crown for the trial of peers indicted for treason or felony. He is a kind of speaker or chairman of the peers, and votes with the rest. It is one of the privileges of the British peerage to be tried by the court of the high steward.

HIGH TREASON. See TREASON.

HIGHWAY, in English law, is the place over which a right is enjoyed by the public, of walking, driving, or riding. It is often called the queen's highway; not because the queen has any greater or better right than any of the public, but to denote the impartiality and equality with which all the subjects enjoy the right of way without distinction. Highways are distinguished into several kinds. 1. A footway, where the public have no right except to walk on foot; 2. A foot and horse way, where the public have the right of walking or riding on horseback; 3. A pack, and drift way—a way used for driving cattle and pack-horses; 4. A foot, horse, and cart way, where the public can walk or ride, or use vehicles of all ordinary descriptions. Navigable rivers are also called highways, but this is rather in a figurative sense. Where the right of way belongs not to the public generally, but to the owner of one or two houses and their tenants, this is called a private way, and is classed among easements.

It has often been disputed, and cannot be said to be yet thoroughly settled, whether a highway must be a thoroughfare—in other words, whether a road which does not lead to any public place can be a highway. The preponderance of authority seems rather to be in favor of the proposition, that it is essential that the highway be a thoroughfare. The mode in which a road is created is by dedication, or by grant of the owner, or by the necessity of things or act of parliament. Thus if a person allow the public for four or five years to pass through his fields without stopping them, this will be evidence from which a jury may infer that the owner meant to make a present to the public of the right of way, and he cannot afterwards exclude the public, for the maxim holds, "once a highway, always a highway." The mode in which a grant of the way is proved, is generally by showing that the public have, from time immemorial, or for a few years without interruption, and with the owner's consent, enjoyed the right of way; for if that is proved, then the law presumes that the right was given by some lost grant. There are also rights of way limited to a particular purpose, which may be proved by immemorial custom, as a way for the inhabitants of a village to or from the parish church. One of the incidents of a highway is, that if it is foundrous, or out of repair, the passenger is entitled to go over the adjacent land, whoever may be the owner of it, so as to avoid the foundrous part of the road. Another incident of the use of a highway is, that if any obstruction is placed upon it, whether in the nature of a gate, or a wall, or even if a house be built too near so as to encroach on the highway, any passenger has a right to abate the nuisance—i.e., he may himself, without any ceremony, remove the obstruction or demolish the wall, but he must take care not to do more damage than is necessary for the purpose of clearing the road, otherwise he will subject himself to an action. Another incident of the use of a highway is, that the public have an absolute right to use every part of it, and to pass to and fro in all directions. Of course, each must comply with certain well-known rules, such as that of giving and taking the road, otherwise, if an accident were to occur, he would be liable for the negligence, if it arose from a neglect of such rules, for these constitute, as it were, the law of the road. It results from this principle, that no person, or body of persons, is entitled to convert part of the highway into any purpose, however useful, other than a highway. Thus in London, and other parts of the country, some vestries and surveyors presumed to give leave to a contractor to lay down a tramway in the streets, which was alleged to be a great public improvement; nevertheless, as it practically resulted in giving a monopoly to some persons, and moreover was an obstruction to others, this was held to be a nuisance, and the parties who took part in it were indicted for the obstruction. And on the same principle, it has been held an indictable nuisance for an electric telegraph company to place their telegraph posts on the strips of land at the side of the road; for

though it might be thought for the benefit of the public, instead of the reverse, yet as it practically obstructed the public in the free passage from every part of the highway to every other, it was held to be a nuisance. Nothing but an act of parliament can legalize such uses of a highway, and no person or body now existing has authority to restrict the free use of the queen's highway in such a manner.

The soil of the highway, or rather the right to the ground beneath the highway, is presumed to be (not, as it is said to be in Scotland, in the crown, but) in the adjoining owners. Thus, if the land on both sides of a highway belong to the same owner, then the right to the ground beneath the road belongs to him also; and if the land on one side belongs to a different owner from the land on the other side, then each is presumed to have the right to the ground under the highway up to the middle line. This rule is more than a mere theory, for though neither of the adjoining owners can ever interfere with the passage of the public, who have an absolute right forever to use it for every lawful purpose of transit, yet the adjoining owner has all the rights incidental to the property which do not interfere with this public right of passage. Thus, if a mine were discovered under the road, the adjoining owner would have the sole right to dig it and keep the contents; all that he would require to attend to would be, to leave sufficient support to the surface of the road. So, in like manner, where there are strips of land at the side of the road on which trees or grass grow, these belong solely to the adjoining owner, and the public have no right to their use. Another remarkable consequence follows, that if, for example, a gas company or a water company were to presume to take up the highway in order to lay their pipes under the surface, this is not only an indictable nuisance as regards the public, inasmuch as it obstructs the use of the road for the time being, but it subjects the company to an action of trespass at the suit of the adjacent owner, whose property consists of all that lies under the surface of the highway. Another consequence of the same rule is, that if a person is loitering on a highway, not with the intention of using it *qua* highway, but for the purpose of poaching at night, the courts have held that he may be punished under the night-poaching act, for trespassing on the land of the adjoining owners in search of game.

The repair of a highway, in general, is a burden which falls upon the occupiers of the lands in the parish. Probably the reason is, that they use those highways most, and somebody or other must keep them in repair. Sometimes, however, the burden of repair is fixed on the owner of the adjoining land, if it can be proved that he has always, from time immemorial, been in the habit of repairing, it being then presumed there was some good reason for this. The general rule is, however, that the inhabitants of the parish must repair the highways within the parish; and so indelible is this obligation, that no agreement they can enter into will relieve them of such a liability. But though bound to repair, they cannot be called on to widen the road. The common remedy, accordingly, when a road is out of repair, is to indict the parish, when, if guilty, the surveyor will be bound to make a rate, and pay the expenses.

Owing to the defects of the common law, which did not sufficiently give power to widen, shut up, and improve highways, so as to keep pace with the wants of the time, a general act of parliament was passed in 1835, called the general highway act, 5 and 6 Will. IV. c. 50, which still regulates the subject. Many minute details are laid down by this act, but substantially the foregoing principles of the common law still govern the subject, the chief alterations being merely in the machinery by which these principles are carried out. The highways are kept in repair by a highway-rate, levied by the surveyor, a person annually appointed by the ratepayers in each parish, and who is vested with the control of the surface of the highway to a limited extent for the purpose of keeping it in due order; so that practically each parish manages its own highways—a state of things which the legislature has to some extent remedied by acts of 1862 and 1864, etc., enabling the justices at quarter sessions to form several parishes into one district, and so enforce more uniformity in the management of the roads. Certain specific uses, or rather abuses, of the highway are also made more promptly punishable by the first statute, such as horsemen riding on footpaths, the tethering of cattle on the sides of the highway, playing at games, baiting bulls, lighting fires, firing off squibs, depositing materials, etc., on the highway.

When any party obstructs, or creates a nuisance on the highway, the proper remedy against him is to indict him for the nuisance; or if any individual has been specially injured by his misconduct, such individual may also bring an action against the party who caused the obstruction.

Many highways are called *turnpikes*, from the fact of their having toll-gates, bars, or turns across them, and are managed by commissioners or trustees. This is always done by some local act of parliament. Where a new road is considered to be of great public benefit, the neighboring proprietors obtain an act of parliament to make it, with powers to take compulsorily the requisite land, and to raise money for the purpose of buying such land, as well as to keep up the road thereafter; and as a means of paying off all this expense, to erect a toll-gate, and levy a tax or toll on all who use the road. This is the history of all these turnpike-roads, the only way of paying the cost of making them being by levying this toll. Several general acts have also been passed to regulate the management of these turnpikes. Sometimes the soil of the turnpike-road is vested in

these trustees. These turnpike-roads were violently opposed at first, the toll being unpopular, but they existed prior to the first general turnpike act, 13 Geo. III. c. 84. The present general turnpike act is 3 Geo. IV. c. 126, but other statutes have passed subsequently. In some cases, part of the highway-rate is ordered to be applied towards keeping up turnpikes, for the parish is bound to repair these roads as well as general highways. Several exemptions from paying toll are created in favor of farmers sending manure, hay, straw, etc., from one part of the farm to another, persons going to or from the parish church, or a funeral, or clergymen going to their church on duty, etc. So persons are exempt who do not pass above 100 yards along the road. All tolls chargeable must be stated in a table of tolls set up at the toll-house.

In the law of Scotland, highway is substantially the same, in most respects, as in England; but there are the following differences. It is generally laid down that the right to the soil of the highway is vested in the crown, and not in the adjoining owners, as in England. This theory, however, has been shaken by recent cases, and has been shown to lead to some absurdities. Streets of burghs are said to be held by the magistrates, under the crown, for the public benefit. The general acts on the subject—viz., 1 and 2 Will. IV. c. 43, and 3 and 4 Will. IV. c. 33, were passed for the regulation of highways, which impose various rules, in detail similar to the English highway and turnpike acts. Parish roads are maintained still on the old system of statute labor. Most of the roads are regulated by special acts of parliament, which are to be taken in conjunction with the general acts. When a public-road is obstructed in Scotland, the party is not indictable; but any one of the public may raise an action of declarator, and so establish the right of the public.

HIGHWAY (*ante*), in a general way the regulation for the construction and management of roads for travel is nearly the same in the United States as in England. Formerly the right to make streets with or without the approval of neighboring property-owners was vested mainly in municipal corporations; but in the case of railways, in modern times, it has become common to require the consent of a majority of the owners along the proposed route. Occasionally, where a road goes through purchased or seized property, it amounts to private property, and none but the owners may intrude thereon. Turnpikes or toll roads were once very numerous, but at present are less so. Cities and towns are responsible for the condition of their highways, and are expected to keep them in good condition. There is a strange difference in the "right of the road" here and in England. In the latter country the law and custom require meeting teams or persons to turn to the left, in the United States it is to the right. Usually the facing owners or cross owners of lots on a highway have the right of property to the middle or across such highway, and may use their property in any way that does not interfere with travel on the road.

HIGHWAYMAN is not a technical legal term, the offense of robbing or assaulting on the highway being included under LARCENY, ROBBERY, or ASSAULT respectively.

HIGLER. See HAWKERS.

HILARIA, a great Roman festival celebrated in honor of Cybele at the vernal equinox. It was begun on Mar. 22, and brought to a close on the 25th. The last day of the feast was the most important, and upon it the inhabitants of the city abandoned themselves to the most extravagant merry-making. All kinds of amusements were then in vogue, especially masquerading, which from the earliest times has been popular in Italy. The only religious ceremony in connection with it was the solemn procession of the priests, who bore round the streets the statue of the great mother of the gods with many solemnities. The festival had for its object the celebration of the departure of winter with its snows and gloom, and hailed the approach of spring.

HILARION, SAINT, 288–371; b. at Gaza of heathen parents. Attracted by the fame of St. Anthony, he went to visit that saint in his solitude, and forthwith became his disciple. Returning to Palestine with some companions while still only a lad of 15, he gave away all the property which he had inherited by the recent death of his parents, and withdrew into the loneliness of the desert between the sea and the marshes on the Egyptian border. In this solitude he observed the most rigid asceticism, and (to quote the quaint remark of Butler) "thought himself at liberty to practice certain mortifications which the respect we owe to our neighbor makes unseasonable in the world." Twenty years of patient continuance in the way of life he had chosen for himself were rewarded, we are told, with miraculous gifts and with rapidly growing fame; disciples and imitators multiplied to the number of two or three thousand, and were all under the spiritual control of Hilarion. When 65 years old, the death of St. Anthony being revealed to him, he undertook an extended tour into Egypt, and visited the scenes of that saint's labors; afterward he proceeded in company of a favorite disciple, Hesychius, to Sicily, where, however, his popularity rendered the quiet and retirement which were congenial to him, impossible. A further migration to Epidaurus thus became necessary, and ultimately he found a resting-place in Cyprus, the diocese of his old friend Epiphanius, where in a lonely cell among some almost inaccessible rocks he died. According to Sozomen, his festival was observed in Palestine with great solemnity as early as the 5th c.; he is now commemorated by the Roman church on Oct. 21.

HILARY, Pope; d. Rome 468 A.D. He succeeded Leo the great in the papal office in 461. He was an earnest promoter of the faith, and was severe in discipline. During his pontificate canons were adopted forbidding the ordination of men who had married a second time; or those who had married widows; and also forbidding bishops to nominate their successors.

HIL'ARY, Saint, Bishop of Poictiers, and doctor of the church, although by no means among the most voluminous of the Latin fathers, yet, from the nature of the subjects on which he wrote, chiefly connected with the Arian controversy, occupies an important place in the patristic literature of the Western church. He was born of pagan parents at Lemonum (Poictiers) in the early part of the 4th century. His conversion to Christianity was mainly the result of his own study of the prophecies, and did not take place till he was advanced in life. About the year 350 he was elected bishop of his native city, and immediately rose to the first place in the animated contest of parties in the Arian controversy. Having provoked the displeasure of the court party, he was imprisoned, and sent into exile in Phrygia; but he appears again in the council of Seleucia in 359, and soon afterwards was permitted to resume possession of his see, where he died, 367. The church holds his day on Jan. 13. His most important work is that on the Trinity, but his three addresses to the emperor Constantius, by their vehemence, and by the boldness of their language, have most attracted the notice of critics. Hilary's theological writings are especially valuable for the history of the Arian party, and particularly for the doctrinal variations of that sect, and the successive phases through which it passed between the council of Nice and the first council of Constantinople. The best edition of the works of St. Hilary is that of the Benedictine Dom. Constant (Paris, 1693), or the reprint of it with additional matter by Maffei (Verona; 1730).—There is a second bishop of the same name who occupies a conspicuous place in the history of the 5th c., Hilary of Arles, born in 401, educated at the celebrated monastic school of Lerins, and made bishop of his native city in 429. As metropolitan of Arles, he presided at several synods, and especially at Orange in 441, the proceedings of which involved him in a serious controversy with the pope, Leo the great. A deposed bishop, named Chelidonius, having carried an appeal to Rome, a council was summoned by pope Leo, at which Hilary was present, and in which the condemnation of Chelidonius, as well as that of another bishop, Projectus, was reversed. Hilary, however, refused to submit to the decision, and soon afterwards quitted Rome—a proceeding which drew upon himself a very severe animadversion. He did not question the authority in itself, but he maintained that it was uncanonically exercised. In the end, however, he sought a reconciliation with pope Leo, and the dispute was brought to an amicable termination. Hilary died in his 48th year at Arles in 449.

HILARY the Deacon, b. in Sardinia in the middle of the 4th c. He and Lucifer of Cagliari appeared at the council of Milan before Constantius, to defend the followers of Athanasius. His remarks offended the emperor so much that he was ordered to be scourged and sentenced to banishment. He held that all heretics, including Arians, should be rebaptized before admission into the Catholic church. Some of the writings ascribed to him are probably not his.

HILARY TERM, one of the English legal terms during which the courts of law sit at Westminster in banc. The term is appointed by statute to commence on Jan. 11 and to end on Jan. 31. The name is said to be borrowed from St. Hilary, bishop of Poictiers.

HILDA, Saint, 614–80; a Saxon lady whose name is intimately associated with the history of the early English church and of early English literature. She was a member of the royal family of Northumbria, her father Hereric being a nephew of king Edwin; and it was along with her royal kinsman that, as a girl of 14, she received baptism at the hands of Paulinus. During the pagan reaction which followed Edwin's defeat and death, Hilda was tempted to settle with her widowed sister Hereswith at the monastery of Chelles, 12 m. from Paris; but she was recalled to England by bishop Aidan, the missionary from Iona, and in 649, two years after her consecration as a nun, she was appointed to succeed Heru the abbess of Heortea or Hartlepool. When, in fulfillment of the vow which he had made before the decisive battle with Penda, Oswy came to dedicate his daughter to God, it was to the care of Hilda that he intrusted her. In 658 the abbess founded the famous monastery on the cliffs of Streoneshalh or Whitby, and for the next 22 years she ruled with rare ability and virtue over the double community of monks and nuns which gathered around her. Among those who shed the most abiding luster on the establishment were St. John of Beverley and the Saxon poet Cædmon. Hilda died, full of years, mourned by her nuns as their common mother. There is a St. Hilda's church both at South Shields and at Hartlepool, and the latter preserves her effigy on its ancient seal. At Whitby the tradition long lingered that on a summer forenoon, when the sun shone in the highest windows of the n. part of the abbey, the figure of lady Hilda could be discerned; and the fossil ammonites of the neighborhood are popularly known as St. Hilda's snakes.

HILDBURGHAU'SEN, chief t. of a circle in the duchy of Saxe-Meiningen, Germany, in a wide and fruitful valley on the river Werra and on the Werra railroad, 17

m. s.e. of Meiningen; pop. '75, 5,162. It is the seat of a district court, of a court of appeal, and of the jury court for the duchy. The streets are wide and regular, and the principal buildings are the former castle of the duchy, erected 1685–95, now used as barracks, with a park in which there is a monument to queen Louise of Prussia; the old town-house, the government buildings, the gymnasium erected in 1877, the normal seminary, and the lunatic asylum. A monument has been erected to those of the citizens who died in the Franco-Prussian war of 1870–71. The manufactures are very various, and include linen fabrics, cloth, papier-maché, toys, buttons, optical instruments, agricultural machines, knives, mineral waters, condensed soups, and condensed milk.

HIL'DEBRAND. See GREGORY VII.

HILDEBRANDT, EDUARD, 1817-68, b. Germany; an artist who commenced life as apprentice to his father, a house-painter at Dantzic. At the age of 20 he went to Berlin, and attracted the attention of Krause, a painter of sea-pieces. His early works betray timidity, and are characterized by great formality; and, had he remained under the influence of German artists, it is questionable whether his genius would ever have triumphed as it did; but, after seeing the French pictures exhibited in Berlin, he was seized with such an enthusiasm for the style he recognized in them, that he set out at once for Paris, and devoted himself to mastering the mysterious secrets of effect, in which the artists of that nation excel. The pictures painted by him upon his return to Germany are impressed with the stamp of the French school, but at the same time reveal the keen active spirit which was quick to render momentary changes of atmosphere and tone. Humboldt's influence led him to travel, and in 1864–65 he accomplished a tour round the world. In his anxiety to produce rapidly, his facility of hand diminished the value of his works for those who regard composition and harmony of tone as the essentials of a picture. His course may be compared to that of a comet, breathlessly rapid and brilliant. He excelled in producing picturesque and startling effects, both by contrast and by his faculty of seizing and reproducing natural phenomena. Fantasies in brilliant colors, views of vast extent, as from the Himalayas and Andes, narrow crowded streets in Suez or Cairo, panoramas, and tortuous lanes and alleys, all served as material for his genius. He died young, and his pictures are scattered throughout Germany; a few of the best being in various collections in Berlin.

HIL'DEN, a t. of Rhenish Prussia, 9 m. e.s.e. from Düsseldorf, on the Itterbach. It is a rapidly-increasing place, with woolen and linen manufactures. Pop. '75, 6,799.

HIL'DESHEIM, an old t. of Hanover, capital of a Prussian administrative division, is situated on the river Innerste, in a pleasant valley surrounded by hills, 24 m. s.e. of Hanover. It is a very quiet town, with very old houses, the upper stories of which are furnished with balconies. It has been a bishop's seat since 822, and its cathedral, dating from the beginning of the 11th c., has bronze gates (date, 1015) 16 ft. high, and covered with bas-reliefs. There are also in the cathedral beautiful paintings on glass, and many art and other treasures. The church of St. Godehard, considered a masterpiece of architecture, dates from 1133 (restored in 1852), and is surmounted with three pyramidal towers. St. Michael's church, nearly an unaltered basilica, dates from 1022 and 1186. In Oct., 1868, some soldiers, digging on the Galgenberg, close by Hildesheim, discovered at a depth of 9 ft. about 60 silver vessels, belonging apparently to the best period of Roman art. Pop. '75, 22,581.

HILDRETH, RICHARD, 1807–65, an author and journalist, b. Mass. He graduated at Harvard college in 1826, studied law in Newburyport, and entered into practice in Boston. In 1832, however, he abandoned the profession to become the editor of the *Boston Atlas.* In the autumn of 1834, being out of health, he went to the south, where he resided nearly two years on a slave plantation. The slavery question was then causing much excitement in the country, and he improved the opportunity to study the workings of the institution for himself. During this time he wrote an antislavery novel, which was published in 1837 under the title of *Archy Moore.* This work was reprinted in England, and in 1852 it was republished in this country under the title of *The White Slave.* It is a tale of thrilling power, and, if the public mind had been prepared for its reception as it was for *Uncle Tom's Cabin,* it could hardly have failed to make an impression as powerful as that produced by Mrs. Stowe's later work. In 1840 appeared his translation of Dumont Bentham's *Theory of Legislation.* His *History of Banks* was published shortly afterwards. When the project for the annexation of Texas began to attract the attention of the country, he published in the *Boston Atlas* a series of articles which did much to intensify the hostility of the northern people to that scheme. He passed the winter of 1837–38 in Washington as correspondent of the *Atlas,* and, upon his return to his editorial chair, entered warmly into the campaign for the election of gen. Harrison to the presidency. In 1840 appeared his *Despotism in America,* a work on the political, economical, and social aspects of slavery. A second edition, with a chapter on *The Legal Basis of Slavery,* appeared in 1854. He published several controversial pamphlets, among them a letter to prof. Andrews Norton, of Cambridge, on *Miracles,* in which the views of that gentleman were warmly opposed. From 1840 to 1843 he resided in Demerara, British Guiana, busying himself in editing two newspapers, in which he advocated the system of free in opposition to slave labor. He also

wrote, while there, his *Theory of Morals* and his *Theory of Politics*, which were published after his return. The work, however, for which he is most likely to be remembered is his *History of the United States*, in six volumes, in which he professes to present the founders of the republic in their true character, without any attempt to heighten their virtues or disguise their mistakes and faults. The history is brought down to the close of Mr. Monroe's first presidential term. In 1855 appeared his *Japan as it Was and Is*. For several years, ending with the inauguration of Lincoln as president, he was engaged on the staff of the *New York Tribune*. He went abroad in the summer of 1861 as U. S. consul at Trieste, and died in Florence.

HILGARD, JULIUS ERASMUS, b. Germany, 1825; came to Illinois in 1835; received a classical education; studied engineering, and in 1845 was employed in the coast survey service, in which he continues. In 1862 he had chief charge of the office, and super vision under the treasury department of weights and measures. He was one of the members of the metric commission at Paris in 1872, and was made one of the permanent committee. In 1847 he was president of the American association for the advancement of science.

HILL, a co. in central Texas, on Brazos river; 1000 sq.m.; pop. '70, 7,453—806 colored. It has an undulating surface, and is largely occupied with forests. The soil is fertile; chief productions: cotton, corn, and pork. Co. seat, Hillsborough.

HILL, AMBROSE POWELL, 1825–65; graduate of the West Point academy; served in the Mexican and Florida wars; afterwards in the coast survey, and in 1861 resigned and took military service in aid of the rebellion. He rose to be lieut.gen., but was killed before Petersburg by a rifle-shot.

HILL, BENJAMIN HARVEY, b. Ga., 1823; graduated at the state university, and began the practice of law in 1845. Six years later he was elected a member of the legislature. He was an early and earnest secessionist, and one of the most outspoken. He was a member of the provisional confederate congress, and a senator in the regular congress. In 1865 he was for a time a prisoner of war. He was always an earnest democrat, and in 1872 was a zealous supporter of Greeley for the presidency.

HILL, ISAAC, 1788–1851; b. Mass.; became a printer, and editor and proprietor of the *New Hampshire Patriot*, a noted democratic newspaper. He was chosen U. S. senator from New Hampshire in 1830; was governor, 1836–39; and was afterwards an officer of the treasury department in Boston. He was for many years the publisher of *The Farmer's Monthly Visitor*.

HILL, JOHN HENRY, D.D., LL.D.; b. N. Y. 1791; graduated at Columbia college, and entered the Protestant Episcopal ministry. He went as a missionary to Greece about 1835, and has been on duty there for half a century.

HILL, Sir ROWLAND, K.C.B., post-office reformer, was b. at Kidderminster, Dec. 3, 1795. His father conducted a school near Birmingham, which was celebrated in connection with the "Hazelwood system of education" (afterwards removed to Bruce castle, Tottenham), and in which Hill was engaged as a teacher until the year 1833. He there joined an association which obtained an act for establishing the colony of South Australia, with the design of reducing to practice Mr. Gibbon Wakefield's scheme of colonization. Hill became secretary to the royal commissioners, who at first managed the affairs of South Australia. He was also a member of the committee of the society for the diffusion of useful knowledge. The high rate of postage had for many years engaged his attention, and in 1837 he published a pamphlet recommending a low and uniform rate of postage throughout the British isles. Petitions were poured into the house of commons in favor of Hill's plan, and in 1837 the house appointed a committee to investigate the merits of penny-postage. In 1840 the principle of a uniform rate of postage was adopted, and an experimental charge of 4d. per letter was levied. This was shortly afterwards followed by the present uniform penny-rate. Hill was placed in the treasury, and was working out his measure when the Tory government succeeded to power, and dismissed him. A subscription was got up at once to reward a public benefactor, and mark the public sense of his dismissal, and the sum of £15,000 was presented to Hill. In 1846, when the whigs returned to office, Hill was appointed secretary to the postmaster-general. In 1854 he succeeded col. Maberley as secretary to the post-office, an appointment which he held till failing health compelled him to resign in 1864. His full salary of £2,000 a year was awarded him for life, and he also received a parliamentary grant of £20,000. He was made K.C.B. in 1860, and D.C.L. (Oxon) in 1864 (see POST-OFFICE). The money-order office is one of the offshoots of penny postage; and parliament, in 1861, engrafted a system of post-office savings-banks upon the postal-service, which was carried out by Hill with his usual administrative ability and success.—His eldest brother, MATTHEW DAVENPORT HILL (died 1872), long the recorder of Birmingham, distinguished himself by his labors for the education of the people, and the reformation of criminals. One of his brothers, Mr. EDWIN HILL, was the inspector of stamps at Somerset house; and another, Mr. FREDERIC HILL, was the first to propound and enforce those humane principles upon which modern prison discipline is founded; and his work, *On Crime*, is a standard authority for legislators. He was assistant secretary to the post-office.

HILL, VISCOUNT (ROWLAND HILL), British gen. and commander-in-chief, a scion of the ancient and distinguished family of the Hills of Shropshire, was second son of sir John Hill, bart., of Hawkstone. He was b. Aug. 11, 1772, entered the army at the age of 15, and obtained a captaincy before he was 20. He took part in the disastrous campaign in which sir John Moore lost his life. He also served in the campaigns of 1809, 1810, and 1811, under the duke of Wellington, and displayed conspicuous gallantry, as well as great talents as a commander. In the peninsular engagements he was usually intrusted with the most important duties next to those which devolved upon the duke of Wellington; and when the army returned home the fame of Hill was second only to that of the great commander. He was created baron Hill of Almarez and Hawkstone, received a parliamentary grant of £2,000 a year; and both title and annuity were granted to his nephew in remainder. He was also made G.C.B. He commanded a division at Waterloo, and remained with the army of occupation, as second in command, until it evacuated the French territory. He succeeded the duke of Wellington in 1828 as commander-in-chief of the army, and dispensed the patronage which he possessed with great impartiality. In 1842 his health declined, and the duke of Wellington once more took the command of the army. After his resignation, Hill was created a viscount. He died unmarried at Hardwicke Grange, co. of Salop, Dec. 10, 1842, in his 71st year. He was succeeded in his titles and estates by his nephew, sir R. Hill, bart.

HILL, ROWLAND, 1744–1833; an English preacher of great eccentricity. While still at Cambridge he made the acquaintance of the Methodist preacher Whitefield, and stimulated by his example he scandalized the university authorities and his own friends by preaching in the surrounding villages before taking holy orders, and conducting religious services in the houses of the sick and poor. He graduated with honor, and taking orders, was appointed, 1773, to the parish of Kingston, Somersetshire, where he indulged his taste for open-air preaching, and attracted great crowds to the services which he held nearly every day of the week. Having on the death of his father in 1780 inherited considerable property, he built for his own use Surrey chapel, in the Blackfriars road, London. The chapel was opened June 8, 1783. Although he now occupied a position as a dissenting minister, Hill conducted his services in accordance with the forms of the church of England, in whose communion he always remained. From the first his success was perfect, and his chapel soon became filled with a larger congregation than any other in London. In the summer months he made what he called "gospel-tours" into all parts of the country, sometimes extending them to Scotland and Ireland, and attracting wherever he went crowded and interested audiences. After these tours he invariably returned with increased enthusiasm to his duties at the Surrey chapel, where he continued to officiate to the end of his life. His oratorical powers, like those of Whitefield, were specially adapted for rude and uncultivated audiences, and were equally effective. He possessed a voice of great power, and, according to Southey, "his manner" was "that of a performer as great in his own line as Kean or Kemble." He occasionally violated laws of good taste by the eccentricities of his wit and humor, but the intensity and purity of the purpose by which he was actuated maintained his moral influence. Among other publications he wrote *Village Dialogues,* which first appeared in 1810, and reached a 34th edition in 1839.

HILL, THOMAS, D.D., LL.D., b. N. J., 1818; educated at Harvard; studied theology; settled at Waltham, Mass., in 1845; in 1859 became president of Antioch college, and in 1862 of Harvard college; resigned in 1868. He accompanied Agassiz on his expedition to South America, and upon his return took a pastoral charge in Portland, Me. He has published poems, an elementary treatise on arithmetic, a work on geometry; *Liberal Education; Jesus the Interpreter of Nature; Natural Sources of Theology,* etc.

HIL'LAH, or HILLA, a t. of Turkey in Asia, in the pashalic of Bagdad, and 60 m. s. of the city of that name, is situated on both banks of the Euphrates, and is built on the ruins of ancient Babylon (q.v.). Here the Euphrates is 450 ft. in width, and is crossed by a floating bridge. Hillah is a fortified town, contains a citadel, a mosque, and several well-stocked bazaars. Dyeing, tanning, and manufactures of silk are here carried on. The population, which is fluctuating, may be stated at between 7,000 and 10,000.

HILLARD, GEORGE STILLMAN, LL.D., b. Me., 1808; graduated at Harvard, 1828; was assistant of George Bancroft in a seminary at Northampton, Mass.; in 1833 became a member of the bar in Boston, and soon acquired a large practice. He was chief officer of the Boston common council; a member of the state legislature and of the senate, and in 1867 U. S. district attorney. In connection with George Ripley, he was, in 1833, editor of the *Christian Register,* a Unitarian paper. Subsequently he turned his attention to literary work and to lecturing. In 1853 he traveled in Europe, and on his return published *Six Months in Italy,* which has passed through many editions, and is still a standard work of its class. He was afterwards a regular contributor to the Boston *Courier,* and wrote a number of biographical works.

HIL'LEL, HABABLI (the Babylonian), or HAZAKEN (the elder), one of the most eminent and influential doctors of the Jewish law, was b. about 112 B.C. in Babylonia, of

poor parents, but in the female line of royal (Davidian) descent. Forty years old—so the legend runs—he migrated into Palestine for the sake of studying the law; and of the small sum he earned by hard manual labor, he gave half to the door-keeper of the academy, where Shemaja and Abtalion, the great masters of the period, expounded the Halacha (q.v.); and before long he became one of the favorite and foremost pupils of Abtalion. Five or six years (Sabb. 15 a.) after Herod had mounted the throne, Hillel was elected Nasi, or president of the Sanhedrim. The range of his acquirements is said to have been immense; embracing not only Scripture and tradition, but nearly all branches of human and "*superhuman*" knowledge. Yet he was one of the meekest, most modest, kind, and simple-hearted men. "Be of the pupils of Aaron, a friend of peace, a promoter of peace, loving mankind, and bringing them nearer to the divine law" (Aboth, i. 2). "Do not confide in thyself, until the day of thy death" (Aboth, ii. 3). "Do not judge thy neighbor, until thou hast been in his place thyself" (Aboth, ii. 5). Such were some of his most favorite sayings. Still more characteristic, and highly curious, if compared with Matt. vii. 12, is the answer he gave to a heathen who, in a spirit of mockery, requested him to teach him "all the law of Moses" while he could stand on one leg. "Do not unto others as thou wouldst not have others do unto thee," Hillel replied; "that is all the law; the rest is mere comment" (Babyl. Talm. Shabb. 31 a.). Hillel was also the first who collected the numberless traditions of the oral law, and arranged them under six heads (see MISHNA). The often alluded to and highly exaggerated dispute between Hillel and his school and Shammai (q.v.), the contemporaneous supreme judge of the Sanhedrim (*Ab-Beth-Din*), and his school, resolves itself into a mere theoretical one: the decisions themselves are, with a very few and unimportant exceptions, identical. Hillel, however, was the more popular of the two, and the majority was, on account of the better authorities he was able to quote in his support, generally on his side.

The time of Hillel's death is uncertain. He is said to have lived, like Moses, 120 years: 40 years in ignorance of the law, 40 years as the humblest pupil of the law, and 40 years as the highest master of the law. A verse of the dirge composed at his death has survived: "Woe for the pious, the modest, the disciple of Ezra" (Sanh. 11 a.). For the further influence of his house and school, see GAMALIEL and TALMUD.

HILLHOUSE, JAMES, LL.D., 1754–1832; b. Conn.; graduated at Yale, and practiced law. He took an active part in the war of the revolution, and at the invasion of New Haven by the English, commanded the governor's guards. In 1791 he became a member of congress, a senator in 1795, and temporary president of the senate in 1800. In 1815 he was a member of the Hartford convention.

HILLHOUSE, JAMES ABRAHAM, 1789–1841; b. Conn.; in early life was a merchant, and in 1819 visited Europe. About 1832 he retired from active business and devoted himself to literature, more especially to verse. His chief works are *Percy's Masque; Hadad;* and *The Judgment.* His poems have been collected and published.

HILL MUSTARD. See BUNIAS.

HILLSBOROUGH, a co. in w. Florida, on the gulf of Mexico and Tampa bay; 2,900 sq.m.; pop. '70, 3,216—546 colored. Surface low and level; productions: cotton, sugar, corn, etc. Co. seat, Tampa.

HILLSBOROUGH, a co. in s. New Hampshire, on the Massachusetts border, on the Merrimac, the Contoocook and other rivers, and intersected by three railroads; 900 sq.m.; pop. '70, 64,238; in '80, 75,606. It has a hilly surface, and much of it is covered with forests. Chief productions: corn, butter, potatoes, and hay. Co. seats three in number: Manchester, Nashua, and Amherst.

HILLSDALE, a co. in s. Michigan, on the Ohio border; drained by the Kalamazoo river, intersected by the Michigan Southern, and the Detroit, Hillsdale, and Southwestern railroad; 580 sq.m.; pop. '80, 32,726. It has a diversified surface, with expansive forests. The soil is fertile, producing wheat, corn, etc. Co. seat, Hillsdale.

HILLSDALE, a city and seat of justice of Hillsdale co., Mich., on the Lake Shore and Michigan Southern railroad, near the St. Joseph's river, 90 m. w.s.w. of Detroit; pop. 3,684. Hillsdale college (Free Baptist) is situated here, and there are churches, banks, good schools, and a number of manufactories.

HILL STATES, a number of small principalities of India, on the left or e. side of the upper Sutlej, comprise about 10,000 sq.m., and about 550,000 inhabitants. With the exception of this aggregate name, they have but little in common with each other. Perhaps 20 may be reckoned which have a distinct existence—those best known being Bhagul, Bussahir, and Gurwhal.

HILO, in regard to size the second t. in the Sandwich islands; pop. '72, 4,220. It is on the e. coast of Hawaii, and has a good harbor, protected by a reef of lava and coral. The town and region are famous for natural beauty. There are four churches, including a Protestant and Roman Catholic church for the natives, a foreign church, and a bethel for sailors. The trade-winds striking against Mauna Kea, a mountain back of the district of Hilo, bring very frequent rains, the rainfall measuring 182 in. in a single year. These rains supply some 50 streams, which empty into the sea within a coast line of 25 m., and are often swollen with violent freshets.

HILTED, a term used in heraldry, to indicate the tincture of the handle of a sword.

HIL'VERSUM, a beautifully situated village in n. Holland, lies 15 m. s.e. from Amsterdam, in the midst of undulating corn-fields, variegated with woodlands. The chief industries are agriculture, the manufacture of strong striped white cottons, carpets, and horse-cloths, spinning and dyeing wool. There are two public schools, with 600 pupils, an institute for young ladies, and another for young gentlemen, a Reformed church, a Roman Catholic church, and a Jewish synagogue. Pop about 6,300.

HIMERA, a city on the n. coast of Sicily, founded 648 B.C. by Carthaginians and exiles from Syracuse, who imparted a Doric character to the language. Early in the 5th c., the tyrant Terillus, being expelled by Theron of Agrigentum, invoked the aid of the Carthaginians. They gladly availed themselves of the pretext, but their general, Hamilcar, was defeated at Himera by the Greeks under Gelon of Syracuse, 480 B.C. Thrasydæus, son of Theron, brought a large body of Doric emigrants to the city in 476; but was soon expelled by Hiero. Himera seems to have enjoyed great prosperity during the remainder of the 5th century. In 415 it refused admittance to the Athenian fleet, and remained a zealous ally of Syracuse. In 408 the Carthaginians sent another great army under Hannibal, grandson of Hamilcar, who razed the city to the ground. A new city, Thermæ Himerenses, was founded in 407 close to the former site. The name was derived from the famous hot springs in which Hercules was said to have bathed. The new city remained in Carthaginian hands until it was annexed by the Romans during the second Punic war. It was peculiarly favored by them, and was left a free city under its own laws. In the time of Cicero it was a flourishing town, though not very large. Under Augustus it became a colony. From that time little is known of it, although the site was never deserted, and the town still exists under the name of Termini. Ergotetes, an Olympian victor celebrated by Pindar, was a citizen of Himera. Stesichorus the poet was a native of the city; and his statue was preserved at Thermæ in the time of Cicero. Agathocles also was a native of Thermæ.

HIMA'LAYA ("the abode of snow," from the Sanscrit, *hima*, snow, and *ālaya*, abode), in s. central Asia, is the most elevated and stupendous mountain system on the globe. It is not, as sometimes represented, a single chain, but a range of rugged snowy peaks depending from the high table-land of Thibet, and separated by deep gorges, the outlets of the streams originating in the melted snow and ice of the interior. The mass of the Himalaya proper extends from the great bend of the Indus in the w., to the junction of the Sampu with the Brahmaputra in the e., or from long. 73° 23′ to 95° 40′ e., a distance of nearly 1500 miles. Their average breadth is about 150 miles. The mean elevation of the range is from 16,000 to 18,000 ft., but 45 of its peaks are now known to exceed 23,000 ft. in height. Of these there are in Kumaon, Nanda Devi, 25,749 ft.; in Nepaul, Dhawalagiri, 26,826 ft.; Mount Everest, 29,002 (the highest known point on the globe); and Kunchinjinga, 28,156 ft.; in Bhotan, Chumalari is 23,946 ft. above the sea. The southern surface of the Himalaya comprises three distinct regions—first, adjoining the plains of Hindustan, the *Tarai*, a grass-covered marshy plain; next, the great belt of *Saul Wood*, stretching along a great part of the range; and beyond it the *Dhuns*, a belt of detritus, extending to the foot of the true mountains.

Above these regions, which are extremely unhealthy, are placed the sanitaria for troops—Darjeeling, Simla, Muree. There are no plains and but few lakes in the Himalaya; the chief of the latter are Nainital, in Kumaon, 6,520 ft., and the lake of Cashmir, 5,126 ft. above the sea.

Snow falls at rare intervals in the mountains as low as 2,500 ft., but at 6,000 ft. it snows regularly every winter. The limit of perennial snow in the Himalaya is 16,200 ft. on the s., and 17,400 ft. on the n. side; an anomaly probably owing to the dry atmosphere of Thibet, and the small quantity of rain and snow that falls there. The high range of the Himalaya forms a vast screen which intercepts and condenses nearly all the moisture carried by the winds from the Indian ocean, and deposits it on the southern face of the mountains; hence at Chirra Punji, 4,200 ft. above the sea, as much as 600 in. of rain has been known to fall in one year. Glaciers are found in every part of the range above the snow-line; one of these, that of Deotal in Gurhwal, is 17,945 ft. above the sea. The mean height of the passes in the Himalaya is 17,800 ft., the highest known is Ibi-Gamin pass into Gurhwal, 20,457 ft., and the highest used for traffic is the Parang pass in Spiti, 18,500 ft. above the sea. All the passes above 16,000 ft. are closed with snow from Nov. till May. Trees and cultivated grains attain their highest limits in the mountains at 11,800 and shrubs at 15,200 ft. above the sea. The tea-plant can be cultivated along the entire southern face of the Himalaya to an elevation of 5,000 ft., but the best is produced at from 2,000 to 3,000 ft. above the sea. Tigers and apes are found at an elevation of 11,000, and the leopard at 13,000 ft., while the dog follows the herds over passes 18,000 ft. high. Snakes are found at an elevation of 15,000 ft., but the highest limit of the mosquito is 8,000 ft. above the sea. The geological structure of the Himalayas consists of crystalline rocks, with granite, gneiss, and a schistose formation, comprising micaceous, chloritic, and talcose schists. Earthquakes are of frequent occurrence in the central range. About the meridian of 82° e., near the Mansarowar lake, a great transverse range, which further n. is called the Giang-ri mountains, abuts against the Himalaya from Thibet. This ridge forms the water-

shed between the Sanpu (afterwards the Brahmaputra) on the e., and the Indus and Ganges on the west. These vast river systems, with their magnificent tributaries, derive their chief supplies from the melting of the snows in the Himalaya, and consequently are in flood at the hottest season of the year when the moisture they supply is most needed.

On account of the majestic height of this mountain range, and the apparent impossibility of reaching its summit, the imagination of the ancient Hindus invested it with the most mysterious properties, and connected it with the history of some of their deities. In the Purânas, the Himalaya is placed to the s. of the fabulous mountain Meru, which stands in the center of the world (see MERU), and described as the king of the mountains, who was inaugurated as such when Prithu was installed in the government of the earth. As the abode of Siva, he is the goal of penitent pilgrims, who repair to his summit in order to win the favors of this terrific god. His wife was Menâ, whom the Pitris or demigods Vairâjas engendered by the mere power of their thought.

HIMILCO, or HIMILCAR, a Cathaginian navigator, who explored the n.w. coast of Europe, about 570 B.C., at the same time that Hanno explored the w. coast of Africa. Avienus has preserved some fragments of the history of this voyage, in which mention is made of the Hiberni and Albioni, and of a promontory, Oestrymnis, thought to be Cornwall, and a group, Oestrymnides, thought to be the Scilly islands.

HIMILCO, or HIMILCAR, a Carthaginian general, son of Hanno, who commanded the expedition against Sicily, 406 B.C., and conquered the w. part of that island. When Dionysius renewed the war, 397 B.C., Himilco again commanded the Carthaginians, at first with success, but subsequently Dionysius assaulted him when greatly disabled by pestilence, and forced upon him a disgraceful capitulation. Himilco abandoned his allies and mercenaries to the mercy of the enemy, and actually paid a large gratuity for permission to depart himself with his native Carthaginians. The disgrace of this surrender so weighed upon him, that soon after returning to Carthage he committed suicide.

HIMMALEH. See HIMALAYA.

HIMYARITES, people of Arabia who claim Himyar, one of the mythical fathers of the Arabians 3,000 years before the time of Mohammed, to have been their ancestor. In s. Arabia they built prosperous towns, Aden among them, and spread their rule over the opposite African coast. At one time they favored Christianity, but in 529 A.D. they were conquered by the Ethiopians and compelled to renounce their faith. About 630 A.D. they were subjected by the Mohammedans and compelled to profess that faith.

HIMYARITIC LANGUAGE AND INSCRIPTIONS, or the language of the races from the Euphrates to Abyssinia, who trace their orgin to Himyar. It is doubtful whether it is a dialect of Arabic only or an independent language. Inscriptions in this language are to be found in s. Arabia, and some specimens are now in the British museum. They probably date from the later Himyarite kings, who flourished from 100 B.C. to A.D. 500. Osiander considers the Himyaritic language as an early form of Hebrew and Assyrian.

HINCK'LEY, a manufacturing and market t. of England, in the co. of Leicester, 13 m. s.w. of the town of that name, and 99 m. n.n.w. of London. Its parish church, with a beautiful old oak roof, is supposed to have been erected during the reign of Edward III. Hinckley has manufactures of cotton hosiery. Part of the town is in Warwickshire. Pop. '71, 6,902.

HINCKS, EDWARD, D.D.; 1792–1866; b. Ireland; graduated at Trinity college, Dublin, and became a clergyman. In 1826 he was appointed rector of the parish of Killyleagh. He was an enthusiastic archæologist, and wrote on Egyptian and Assyrian inscriptions. He published a catalogue of the Egyptian manuscripts preserved in the library of Trinity college, and some works on religious subjects.

HINCKS, Sir FRANCIS, b. Ireland, 1807; was engaged in early life in mercantile business in Canada, and subsequently in journalism, being proprietor of the *Toronto Examiner*. He was successively finance minister of the colony, and in 1851 prime-minister. In 1855 he was made governor of the Windward islands, and governor of British Guiana in 1862. In 1869 he was knighted, and was again chosen finance minister of Canada.

HINC'MAR, a celebrated churchman of the 9th c., was b. in 806. The exact place of his birth is unknown, but from his being of the family of the counts of Toulouse, it is presumed to have been in that province. He was educated in the monastery of St. Denis, and, with the sanction of the council of Paris (829), he was intrusted with the framing and carrying out a plan for the reformation of the monastery. Some time afterwards, he was named abbot of the abbeys of Compiègne and St. Germain; and in 845 was elected archbishop of Rheims. The most important event, considered historically, in the career of Hincmar, is his controversy with pope Nicholas I. in the year 862 (see NICHOLAS I.). Rothadius, bishop of Soissons and suffragan of Hincmar, deposed a priest of his diocese, who appealed to Hincmar as metropolitan, and was ordered by him to be restored to office. Rothadius resisting this order, and having

been, in consequence, condemned and excommunicated by the archbishop, appealed to the pope, who at once ordered Hincmar to restore Rothadius, or to appear at Rome in person or by his representative, to vindicate the sentence. Hincmar sent a legate to Rome, but refused to restore the deposed bishop; whereupon Nicholas annulled the sentence, and required that the cause should again be heard in Rome. Hincmar, after some demur, was forced to acquiesce. The cause of Rothadius was re-examined, and he was acquitted, and restored to his see.

The conduct of Hincmar is also historically interesting in relation to the temporal power of the mediæval papacy (see POPES). Under the successor of Nicholas, Adrian II., a question arose as to the succession to the sovereignty of Lorraine on the death of king Lothaire, the pope favoring the pretensions of the emperor Lewis in opposition to those of Charles the bold of France. To the mandate which Adrian addressed to the subjects of Charles and to the nobles of Lorraine, accompanied by a menace of the censures of the church, Hincmar offered a firm and persistent opposition. He was equally firm in resisting the undue extension of the royal prerogative in ecclesiastical affairs. When the emperor Lewis III., in opposition to the solemn judgment of the council of Vienne, sought to obtrude an unworthy favorite, Odacer, upon the see of Beauvais, Hincmar boldly remonstrated, and fearlessly denounced the unjustifiable usurpation. Hincmar died in the year 882. His works were collected in two vols. folio by Père Sirmond, S. J. (Paris, 1645). Several other pieces of his are found in the 8th vol. of Labbe's *Collection of Councils*, and in the 5th vol. of that of Hardouin; as also in Père Cellot's *Concil. Duziac.* (Paris, 1658). Many others of his works, still in MS., are enumerated in Wetzer's *Kirchen-Lexicon*, v. 308.

HIND, the female of the stag (q.v.) or red deer. The term is also sometimes used to designate the female of some other species of deer—never being so applied, however, to any other British or European species; and is sometimes even extended to female antelopes. In the strictest use of the term hind, according to the ancient laws and customs of "venerie," it did not become the designation of a female red deer until the third year of its age.

HIND, JOHN RUSSELL, an English astronomer, was b. at Nottingham, May 12, 1823. At an early period he became an enthusiast in the study of astronomy, and in 1840 obtained, through the influence of prof. Wheatstone, a situation in the royal observatory at Greenwich, where he remained till June, 1844. Hind was then sent as one of the commission appointed to determine the exact longitude of Valentia, and on his return was appointed to a post in Mr. Bishop's observatory, Regent's park, London. Here he made those observations, the results of which have rendered his name renowned in the scientific world. He has calculated the orbits and declination of more than 70 planets and comets, noted 16 new movable stars, and 3 nebulæ, and discovered 10 new planets, viz., Iris and Flora in 1847, Victoria in 1850, Irene in 1851, Melpomene, Fortuna, Calliope, and Thalia in 1852, Euterpe in 1853, and Urania in 1854. In 1851 Hind obtained from the academy of sciences, Paris, the Lalande medal, and was elected a corresponding member. In 1852 he obtained the astronomical society of London's gold medal, and a pension of £200 a year from the British government. He also superintends the publication of the *Nautical Almanac*. Hind's scientific papers have generally been published in the *Transactions of the Astronomical Society*, in the *Comptes Rendus* of Paris, and the *Astronomische Nachrichten* of Altona. Hind's popular works are—*Recent Comets and the Elements of their Orbits* (published in the *Athenæum*, Aug. 9, 1845); *Astronomical Vocabulary* (16mo, 1852); *The Comets* (12mo, 1852); *The Solar System* (8vo, 1852); *Illustrated London Astronomy* (8vo, 1853). *Elements of Algebra* (Lond. 1855); *Descriptive Treatise on Comets* (1857), etc.

HINDLEY, a t. of Lancashire, England, 3 m. s.e. from Wigan, with which it is connected by railway, on the Manchester road. Its growth has of late years been rapid. There are numerous coal-works in the vicinity; cotton-spinning and the manufacture of cotton goods are also extensively prosecuted. There are places of worship belonging to the church of England, and to a number of other denominations; a free grammar-school, and numerous other schools. Pop. '61, 8,477; '71, 10,627.

HINDS, a co. in s.w. central Mississippi, on Pearl and Big Black rivers, crossed by the Vicksburg and Meriden, and the New Orleans, St. Louis and Chicago railroads; 930 sq.m.; pop. '70, 30,488. The surface is level and the soil fertile; cotton, corn, and pork are the chief products. Co. seat, Jackson (the state capital).

HINDU KUSH, or INDIAN CAUCASUS, forms the westward continuation of the Himalaya, being sometimes reckoned a part of that colossal range. It extends from the Upper Indus on the e. to the Bamian pass (q.v.) on the w., stretching in n. lat. between 34° and 36°, and in e. long. between 68° and 75°. Separating Afghanistan on the s. from Turkistan on the n., it sends off the Oxus through the latter, and the Helmund through the former, to two salt lakes—the Oxus to Aral, and the Helmund to Hamûn. The loftiest summit is Hindu Koh, situated about 80 m. to the n. of the city of Cabul, and estimated to be more than 20,000 ft. above the sea. Unlike the Himalaya Proper, the chain is a water-shed, and is also remarkably destitute of timber; while, like the ridge in question, it presents an appearance of much greater height towards the s. than towards the north.

HINDU LAW, RELIGION, etc. See INDIA.

HINDUSTAN', meaning *The Land of the Hindus,* is a term of the same class as Turkistan, Afghanistan, Farsistan, Beloochistan, or Frangistan (the oriental name of western Europe). See INDIA.

HINGE, the pivots or joints on which doors, shutters, etc., revolve. The simplest form of hinge is a projection cut upon the substance of which the door is made, and fitted into a hole. This is sometimes done with wooden shutters, and there are examples extant of *stone shutters* hinged in this manner. The cathedral of *Torcello,* near Venice, which dates from the 11th c., still has the windows protected with shutters formed of large slabs of stone, hinged on stone pivots. During the middle ages, hinges, as well as every other useful article, were made subjects of ornamentation. The earliest ornamental hinges date from about the 10th century. The first examples are cramped and stiff, and the scrolls are frequently terminated with animals' heads. In the early English and decorated styles, the hinges and other metal-work were very elaborate and beautiful in design, and frequently extended over the whole of the doors. In the perpendicular style, hinges were usually very simple in form, the paneling of the wood-work not admitting of much ornamental iron-work. In modern times hinges have almost entirely lost their ornamental character. They are chiefly made of brass and iron, and fitted on the edges of the doors and shutters, where they are concealed. "Double-jointed edge-hinges" are those now most in use. The revival of mediæval architecture has, however, given an impulse to the manufacture of ornamental metal-work, and hinges of varied and good design are now generally used in connection with Gothic architecture.

HINGHAM, a t. in Plymouth co., Mass., on the sea-coast, intersected by the Old Colony railroad; the village is 12 m. by water from Boston; pop. of township, 4,485. The village is a strange old place near Nantasket. It was settled in 1635, and its first pastor came from the place of the same name in England. In the cemetery there is a fine monument to the early settlers, and a statue to the memory of John A. Andrew, the "war governor" of Massachusetts. Derby academy is located here, and there are other schools, churches, and manufactures. It is a popular place of summer resort.

HINNOM, VALLEY OF. See GEHENNA.

HINNY, the hybrid produced between a horse and a female ass. It is smaller than a mule, but the body is more bulky in proportion to the legs, and its strength is inferior. It is less valuable than the mule, although it is more docile. The hinny is rare. It was described by some of the earlier naturalists as a hybrid between the ox and the ass, and even Buffon seems to have entertained this notion.

HINOJOSA-DEL-DUQUE, a t. of Spain, in the province of Cordova, and 45 m. n.w. of the city of that name, consists of spacious streets, with neat white-washed houses, each with a garden or court attached. It has several convents and hospitals, and linen and woolen manufactures. Pop. between 7,000 and 8,000.

HINSDALE, a co. in s.w. Colorado on the Rio del Norte and Gunnison rivers, formed after the census of 1870. The surface is mountainous, and some of the peaks are remarkably high. There are silver mines in operation. Co. seat, Lake City.

HINSDALE, BURKE AARON, b. Ohio, 1837; educated at Hiram college, and in 1861 entered the Campbellite ministry, officiating in Cleveland and other places. In 1866 he was chosen assistant editor of the *Christian Standard.* In 1869 he was professor of history in Hiram college, and the next year became its president. He is the author of *Genuineness and Authenticity of the Gospel; The Evolution of the Theological and Doctrinal Systems of the Ancient Church;* and *Republican Text-Book for* 1880.

HINTON, JOHN HOWARD, 1791–1873; b. England; a Baptist preacher, and a zealous advocate of voluntary work in education and religion. He wrote *History and Topography of the United States; Elements of Natural History;* etc.

HIOGO, or FIOGO, a seaport of Japan on the island of Hondo, at the head of the gulf of Osaka. There is an excellent harbor, a town-hall, custom-house, government machine-shops, gas-light for the streets, and extensive trade.

HIOUEN-THSANG, a celebrated Chinese traveler, professing the Buddhist creed, who visited 110 countries and places of India in the first half of the 7th c. (629–645), and gave a very detailed and interesting account of the condition of Buddhism as it prevailed at that period in India. His inquiries having been chiefly devoted to the objects of his veneration, he did not enter so much into details concerning the social and political condition of India as might be desired; but considering the many curious notices he gives on other matters which, besides those of Buddhist interest, came under his observation, and the high degree of trustworthiness which his narrative possesses, his memoirs must be looked upon as one of the most important works on the history of India in general, and of Buddhism in particular, during the period stated. Apparently, he traveled alone, or with a few occasional companions; and wearing the garb of a religious mendicant, with nothing but a staff, wallet, and water-pot, he does not seem to have been exposed to any dangerous adventures on his journey from China to India. It is more remarkable, however, that he incurred no impediment on his way

home, when he traveled with 500 packages of books, besides images of Buddha and various sacred relics; and his immunity from danger affords a remarkable proof of the civilized condition of the countries which he described. It does not appear that the account of his travels was written by himself, for of the two works relating to them neither is the performance of Hiouen-Thsang. The first is a bibliographical notice of him, in which his travels form a principal feature; it was composed by two of his pupils, Hoeï-li and Yen-Thsong. The latter bears the title of *Ta-thang-si-yu-ki*, or "Memoirs of the Countries of the West, published under the Thang," and was edited by Pien-ki, since Hiouen-Thsang himself, who during 17 years had spoken none but foreign languages, had perhaps lost the facility of writing elegant Chinese. According to a remark added to the title of his work in the imperial Chinese edition, it would follow that it had been translated from Sanscrit into Chinese; but this statement, as prof. Stanislas Julien observes, can only mean that the fundamental part of the work relating to history, legends, etc., was taken from Hindu sources, since it is obvious that the indication of distances and numerous personal observations must have come from Hiouen-Thsang himself. Both works have been published in a French translation by the distinguished Chinese scholar, M. Stanislas Julien, who has acquitted himself of the great and peculiar difficulties of his task in so creditable a manner that his *Histoire de la Vie de Hiouen-Thsang* (Paris, 1853) and his *Mémoires sur les Contrées Occidentales, par Hiouen-Thsang* (2 vols., Paris, 1857–1858) have not only become indispensable to the student of Chinese and Sanscrit literature, but will be a lasting honor to M. Julien's industry and scholarship. An abstract of both works, by the late prof. H. H. Wilson, appeared in the 17th volume of the journal of the royal Asiatic society, pp. 106–137.

HIP, or Hep, the fruit of the rose. It is almost always red, and consists of the enlarged fleshy tube of the calyx filled with hard seed-like *achænia*, which are surrounded with bristly hairs (*setæ*). The fleshy covering contains mucilage, sugar, gum, malic and citric acids, tannin, resin, and a number of salts. The setæ excite itching in the skin. The fleshy part of hips, beaten to a pulp, and preserved with sugar, finds a place in the pharmacopœia, under the name of conserve of hips (*conserva rosæ fructûs, confectio rosæ caninæ*, etc.). It is slightly refrigerant and astringent, and is often used as a vehicle or basis for other medicines. Hips eaten entire are a popular remedy for ascarides, on which their action is purely mechanical, and is owing to the irritating setæ. The hips of different species of rose are almost indiscriminately used. In some parts of Europe hips are preserved in sugar as an article of food, or are dried and used in soups and stews, the achænia and setæ being removed. For this purpose, the large soft hips of the apple rose (*rosa pomifera*) are preferred.

HIP, in architecture, the rafter at the angle where two sloping roofs meet. A roof is called a hipped roof when the end is sloped upwards so as to form a hip on each side.

HIP-JOINT is a ball-and-socket joint formed by the reception of the globular head of the thigh-bone (or femur) into the deep pit or cup in the *os innominatum*, which is known as the *acetabulum* (so called from its resemblance to the vinegar cups used by the Romans. If the variety of the movements of this joint—viz., flexion, extension, abduction, adduction, and rotation inwards and outwards, and at the same time its great strength are considered, it may well claim to be regarded as the most perfect joint in the whole body.

The ligaments are usually described as five in number—viz.: 1. The capsular; 2. The ilio-femoral; 3. The *teres* or round; 4. The cotyloid; and 5. The transverse. Of these, the capsular ligament is the most important, and extends from the edge of the cup to the circumference of the neck upon which the ball is carried, inclosing the bony parts in a strong sheath. The ilio-femoral is merely an accessory band of fibers which give increased thickness to the capsular ligament in front, where strength is specially required. The great use of the capsular ligament is to limit the extension of the hip-joint, and thus to give steadiness to the erect posture. The only other ligament requiring notice is the *L. teres*, or round ligament, which is in reality triangular rather than round, and has its apex attached to the head of the thigh-bone, while its base is connected with the cavity of the acetabulum. Its use is not very clearly known, but probably is to limit movement in one direction. It is sometimes absent in cases in which no special weakness of the joint was observed during life, and is of by no means constant occurrence in mammals. The joint is much strengthened by a large number of surrounding muscles, some of which are of considerable power.

In such a joint as this, although the ligaments materially assist in preventing dislocation, it is obvious that the articular surfaces cannot, under ordinary circumstances, be kept in apposition by them, inasmuch as they must be loose in their whole circumference, to permit of the general movements of the joint. The experiments of Weber show that atmospheric pressure is the real power by which the head of the femur is retained in the acetabulum when the muscles are at rest. "One convincing experiment is easily repeated—that, namely, of holding up a side of the pelvis, with its appended lower extremity, the joint not having been opened, and then boring a hole through the acetabulum, so as to admit air into the joint, when the weight of the limb will cause it to drop from half an inch to an inch, the head of the thigh-bone being pulled out of

the acetabulum as soon as the air is permitted to pass between the articular surfaces."—Humphry *On the Human Skeleton*, p. 74.

DISEASE OF THE HIP-JOINT. Hip-disease differs in so many points of importance from other joint-diseases, and is so serious an affection, that it requires a special notice. Its connection with scrofula is more distinctly marked than that of most other joint-diseases, and it almost always occurs before the age of puberty. It comes on, in children or young persons of a scrofulous constitution, from very slight causes; thus, it is often traced to over-exertion in a long walk, a sprain in jumping, or a fall; and in many cases no apparent cause can be assigned.

In the early stage of the disease the whole of the structures of the joint are inflamed, and by proper treatment at this period the morbid action may be sometimes subdued without any worse consequences than a more or less rigid joint. Usually, however, abscesses form around the joint, and often communicate with its interior; and the acetabulum, and the head and neck of the thigh-bone, become disintegrated, softened, and gritty. In a still more advanced stage, dislocation of the head of the thigh-bone commonly occurs, either from the capsular ligament becoming more or less destroyed, and the head of the bone being drawn out of its cavity by the action of the surrounding muscles, or from a fungous mass sprouting up from the bottom of the cavity, and pushing the head of the bone before it.

It is of extreme importance that the symptoms should be detected in an early stage of the disease; and on the least suspicion of this joint being affected, surgical aid should at once be sought.

As the disease advances, abscesses (as already mentioned) occur around the joint, which sometimes, from the tension they exert on the obturator nerve, occasion extreme pain in the inside of the thigh. True shortening of the limb now takes place, which at the same time becomes adducted and inverted. From this stage, if the health is pretty good, and the lungs are sound, the patient may be so fortunate as to recover with an anchylosed (or immovable) hip-joint; but the probability is that exhaustion and hectic will come on, and that death will supervene, from the wasting influence of the purulent discharges occasioned by the diseased bone.

The duration of the disease may vary from two or three months to ten or more years.

As the treatment must be left entirely in the hands of the surgeon, it is unnecessary to say more than that the most important points are *perfect rest* to the affected part, which may be secured by a strong leather splint, or by a starch bandage, the internal administration of cod-liver oil and tonics, and the application of counter-irritation by means of an issue behind the great trochanter.

HIP-KNOB, an ornament carved in stone or wood, set on the apex of a gable or hipped roof, and forming a kind of finial (q.v.).

HIPPAR'CHUS, the first systematic astronomer on record, was born, according to Strabo, at Nicæa, in Bithynia, about the beginning of the 2d c. B.C. Of his personal history, nothing is known. According to Fabricius, Hipparchus wrote nine separate works, of which only the last and least important, *A Commentary on Aratus*, has come down to us. The other works treated of astronomy and geography. The only authority we have regarding the discoveries made by Hipparchus is the *Syntaxis* of Ptolemy, and from it we learn that Hipparchus discovered the "precession of the equinoxes," determined the place of the equinox among the stars, established the solar and lunar theories, invented the astrolabe (q.v.), and drew up a catalogue of upwards of 1000 stars, determining the longitude and latitude of each. As Ptolemy was also an astronomer, there is some difficulty in allotting to each his meed of praise for the discoveries mentioned in the *Syntaxis*, which difficulty has given rise to much discussion, resulting in favor of the claims of Hipparchus. See Delambre's *Histoire de l'Astronomie Ancienne* (Paris, 1817).

HIPPARION, an extinct animal belonging to the horse family, and regarded by several modern naturalists as one of the links in the chain of evidence which supports the theory of the progressive development of creation, or the Darwinian doctrine of evolution. See HORSE, FOSSIL.

HIPPO, or HIPPO REGIUS, a city of Numidia, of which the ruins are yet to be seen, near the gulf of Bona, Algeria. Hippo was the residence of the rulers of Numidia, and in later years the see of St. Augustine. The Vandals destroyed the town in 431 A.D.

HIPPOBOSCIDÆ. See FOREST FLY and SPIDER FLY.

HIPPOCAM'PUS, a genus of osseous fishes, of the order *lophobranchii* (q.v.), and of the family *syngnathidæ* (see PIPE-FISH), by some naturalists made the type of a separate family, *hippocampidæ*, remarkably distinguished by the prehensile tail, which is tapering, and quite destitute of fin. The species, which are not very numerous, but some of which are found in the seas of all parts of the world, are fishes of very extraordinary form and habits. They have the jaws united and tubular, as in the pipe-fishes; the body compressed, short, and deep; the whole length of the body and tail divided by longitudinal and transverse ridges, with tubercles at their intersections. The scales are ganoid, clothing the whole body in a kind of armor. The males have pouches on the

tail, in which the eggs are carried till they are hatched. From their appearance, these fishes have received the name of SEA-HORSE. They swim in a vertical position, and are always ready to entwine their tails around sea-weeds, or even with one another. They are very interesting objects in an aquarium. One species, *H. brevirostris*, is occasionally found on the shores of Britain, particularly in the south.—Hippocampus in the Grecian mythology was a sea-horse—half fish, half horse—which served Poseidon (Neptune).

HIP'POCRAS, an aromatic medicated wine, formerly much used in this country, and still employed on some parts of the continent. The following was the method of preparing it: Twelve pints of Lisbon were mixed with an equal quantity of Canary wine. Bruised spices of various kinds were digested in the wine for three or four days, after which it was strained, and two pounds and a half of lump-sugar were added. It was doubtless an admirable cordial.

HIPPOC'RATES, the most celebrated physician of antiquity, was the son of Heraclcides, who was also a physician, and belonged to the family of the Asclepiadæ, the subject of the present notice being either the 19th or the 17th in descent from Æsculapius. His mother, whose name was Phænarete, was said to be descended from Hercules. He was born in the island of Cos, probably about the year 460 B.C. He is said to have been instructed in medicine by his father and by Herodicus, and in philosophy by Gorgias of Leontini, the celebrated sophist, and Democritus of Abdera, whose cure, when affected by madness, he afterwards effected. After spending some time in traveling through different parts of Greece, he settled and practiced his profession at Cos, and finally died at Larissa, in Thessaly. His age at the time of his death is uncertain, and is stated by different ancient authors to have been 85, 90, 104, and 109 years. Clinton (*Fasti Hell.*) places his death 357 B.C., at the age of 104. We know little more of his personal history than that he was highly esteemed as a physician and an author, and that he raised the medical school of Cos to a very high reputation. His works were studied and quoted by Plato. Various stories are recorded of him by Greek writers, which are undoubtedly fabulous, and to which it is therefore unnecessary to advert; and we find legends regarding him in the works of Arabic writers, who term him "Bokrát," while the European story-tellers of the middle ages celebrate him under the name of "Ypocras," and, in defiance of chronology, make him professor of medicine at Rome, with a nephew of wondrous medical skill, whom he dispatched in his own stead to the king of Hungary.

The works bearing the name of Hippocrates, and termed the Hippocratic collection, are more than 60 in number, and, as Dr. Greenhill observes in his article on Hippocrates in Smith's *Dictionary of Greek and Roman Biography*, etc., "the classification of these, and assigning each (as far as possible) to its proper author, constitutes by far the most difficult question connected with ancient medical writers." Dr. Greenhill divides the Hippocratic collection into eight classes, of which we need specify only two. (For convenience, we give the Latin instead of the Greek titles.)

Class I.—Works *certainly* written by Hippocrates, containing *Prognostica; Aphorismi; De Morbis Popularibus; De Ratione Victus in Morbis Acutis; De Aëre, Aquis, et Locis;* and *De Capitis Vulneribus.* Some eminent critics doubt the genuineness of some portions of the *Aphorismi*, the work by which Hippocrates is most popularly known.

Class II.—Works *perhaps* written by Hippocrates. These are 11 in number, and one of them is the well-known *Jusjurandum*, or "Hippocratic Oath."

The others consist of works written before Hippocrates; works whose author is conjectured; works by quite unknown authors; and willful forgeries.

For anything like a full account of his views, we must refer to the various writers who have treated of the history of medicine. We can here only mention that he divides the causes of disease into two principal classes: the first consisting of the influence of seasons, climates, water, situation, etc.; and the second of more personal causes, such as the food and exercise of the individual patient. His belief in the influence which different climates exert on the human constitution is very strongly expressed. He ascribes to this influence both the conformation of the body and the disposition of the mind, and hence accounts for the differences between the hardy Greek and the Asiatic. The four fluids or humors of the body (blood, phlegm, yellow bile, and black bile) were regarded by him as the primary seats of disease; health was the result of the due combination (or *crasis*) of these, and illness was the consequence of a disturbance of this crasis. When a disease was proceeding favorably, these humors underwent a certain change (or *coction*), which was the sign of returning health, as preparing the way for the expulsion of morbid matter, or *crisis*, these crises having a tendency to occur at definite periods, which were hence called "critical days." His treatment of diseases was cautious, and what we now term expectant; it consisted chiefly and often solely in attention to diet and regimen; and he was sometimes reproached with letting his patients die by doing nothing to keep them alive.

The works of Hippocrates were translated at an early period into Arabic. They were first printed in a Latin translation in 1525 at Rome. The first Greek edition (the Aldine) appeared the following year at Venice; an edition by Mercurialis appeared in 1588, one by Foësius in 1595, and one by Van der Linden (still much esteemed) in 1665. Other editions have appeared under the editorship of Chartier, Kühn, etc. The latest,

and incomparably the best edition, is that of Littré, in 10 volumes, the first of which appeared in 1839, and the last in 1861. An edition by Ermerins, with a Latin translation, is now in course of publication at Utrecht, at the expense of the university of Amsterdam. The Latin title runs as follows: *Hippocratis et aliorum Medicorum veterum Reliquiæ. Edidit Franciscus Zacharias Ermerius.* The first three volumes appeared between 1859 and 1863. An excellent English translation of *The Genuine Works of Hippocrates* was published in 1849 in 2 vols., by Dr. Adams. The admirable French translation by M. Littré (1839–61) is in 10 vols.

HIPPOCRATIC OATH, a formula ascribed to Hippocrates, and taken by persons entering the medical profession. By this oath they promised fealty to the profession and general good conduct in their lives. It is not dissimilar to the oaths of masonic and other societies at the present time.

HIPPOCRE'NE (derived from *hippos*, a horse, and *krēnē*, a fountain) is a fountain on Mt. Helicon, about 20 stadia above the grove of the muses, and, according to the mythical account, was produced by a stroke from the hoof of the horse Pegasus (q.v.). It was sacred to the muses. In modern times, some have attempted to identify it with a fine spring at Makariotissa, and this opinion is most probably correct. See HELICON.

HIPPODAMI'A, the beautiful daughter of Œnomaus, king of Pisa, in Elis, and the pleiad Asterope. It had been predicted to her father that he should be slain by his future son-in-law; he therefore stipulated that every suitor of his daughter should run a chariot-race with him. and that death should be the consequence of defeat. Thirteen, or, as some say, seventeen suitors had already been conquered and slain, when Pelops came to Lydia. Pelops bribed Myrtilus, the king's charioteer, and thus succeeded in reaching the goal before Œnomaus, who in despair killed himself. Hippodamia became the wife of Pelops, and the mother of Atreus and Thyestes. She afterwards destroyed herself from grief at being reproached with having led her sons to murder each other.

HIPPODROME (Gr. *hippos*, a horse, and *dromos*, a race-course), the Greek name for the place set apart for horse and chariot races. Its dimensions were, according to the common opinion, half a mile in length and one-eighth of a mile in breadth. In construction and all important points of arrangement, it was the counterpart of the Roman circus (q.v.), with the exception of the arrangement of the chariots at the starting-place. In the hippodrome, the chariots were arranged so as to form two sides of an isosceles triangle, with the apex towards the goal and a little to the right side. But as this would have given the chariots on the left side a longer course than those on the right, the hippodrome was constructed with the right side longer than the other. The start was effected by setting free the chariots on the extreme right and left, and when they came opposite the next two, by setting them free also, and so on till all were in motion. The hippodrome was also much wider than the Roman circus, to allow room for the greater number of chariots, for though we have no precise information as to the number that usually started in one race, we know that Alcibiades on one occasion sent seven; Sophocles mentions ten chariots as competing at the Pythian games; and the number at the Olympic games must have been considerably greater. There is a beautiful description of a chariot-race in Homer (*Iliad*, xxiii. 262–650). The golden age of the hippodrome was during the lower Greek empire. The blue and green factions in the hippodrome carried their animosity into all departments of the public service, and laid the foundation of that perpetual disunion which rendered the Byzantine empire a prey to every aggressor.—The term hippodrome has been given to a circus constructed in 1845 at Paris, and also to a large field in the plain of Longchamp, near Boulogne, used as a race-course.

HIP'POGRIFF, or HIPPOGRYPH (Gr. *hippos*, a horse, and *gryph-*, griffin), a fabulous animal, which has been represented as a winged horse, with the head of a griffin. The hippogriff figures largely in the *Orlando Furioso* of Ariosto.

HIPPOL'YTUS, the name of several saints and martyrs of the early church, among whom the chief interest is concentrated upon one who is believed to have flourished in the early part of the 3d c., to have been bishop of Portus, near Rome, and to have suffered martyrdom under Alexander Severus. All the facts connected with the history of this saint have long been the subject of much doubt and controversy; and the interest of the discussion has been much heightened of late years by the discovery of a very curious and important work, certainly of the age of the supposed Hippolytus, and calculated, if a genuine work of that author, to throw a most curious light upon the early history of the church. The work in question was one of several Greek MSS. obtained at Mt. Athos in 1842, by M. Menas, an agent of the French government, and was published in 1851, at the expense of the university of Oxford, to which it was recommended as a work of exceeding interest for the history of the early church, by M. Emmanuel Miller, who undertook the task of editing it. M. Miller published it as a work of Origen, under the title of *Origenis Philosophumena*. The late baron Bunsen was the first to conjecture that the true author was Hippolytus, but he was mistaken as to the particular work of Hippolytus which he took it to be; and for a time the question of the authorship remained in much uncertainty. Some critics still adhered to the opinion that the author was Origen; some ascribed the work to the Roman priest Caius; others,

again, to Tertullian; and others, in fine, to some unknown Novatian heretic. The result of the discussion, however, seems to be that although Bunsen was mistaken in supposing this treatise to be a work of Hippolytus, which Photius has described as a "*little treatise* against heresies," by that author, yet it is in reality a *larger treatise* on the same subject and by the same author.

There still remained, however, a further question, namely, Who is the Hippolytus who is to be regarded as the author? Without reckoning many later saints of that name, Dr. Döllinger, in his *Hippolytus und Kallistus*, enumerates at least six contemporaneous, or nearly contemporaneous, with the supposed Hippolytus of Portus. It must suffice to state that although not absolutely certain, the opinion that the author of the *Philosophumena* was the Hippolytus already known in the ancient church as a writer and as a martyr, has met with almost universal acceptance.

From the autobiographical details contained in the treatise, added to the particulars already known, we learn that this Hippolytus, the time and place of whose birth are uncertain, was, about the year 218, bishop of Portus, near Ostia, a suburban see of Rome, and as such, a member of the ecclesiastical council of that city. This fact receives a very decisive confirmation from a statue discovered in Rome in 1561, inscribed with the name of Hippolytus, the title of his see, "Portuensis," and the paschal cycle of which Hippolytus is known to have been the author. In the persecution of Maximin, 235, Hippolytus was exiled to the island of Sardinia, from which he was permitted soon afterwards to return; but in a new outbreak of the persecution, he was put to death, probably in 238. Probably, from the connection of his see with the Roman church, Hippolytus took an active part in the affairs of that church, and placed himself in violent opposition to the bishop Callistus, whom he denounces in the treatise in the most unmeasured terms, both as to his private character and his public administration, as a person of most disreputable antecedents, as well as criminally lax in the government of the church, and especially in the administration of penance, after his election to the see. The tone which he adopts toward the Roman bishop, indeed, is so disrespectful as to appear to the Protestant critics a clear and conclusive evidence that, in the church of the 3d c., that bishop cannot have possessed the supremacy which the advocates of the papal pretensions ascribe to him. It is difficult, in truth, to conceive any bishop in the modern Roman system addressing the pope in such terms as those which Hippolytus applies to Callistus.

The Roman Catholic critics reply that the very violence of the language employed, and the unscrupulous nature of the imputations, contain their own refutation; and they contend that no argument can be founded on Hippolytus's opposition to the authority of the Roman bishop, inasmuch as not only the opinions expressed in this very treatise, but also the direct testimony of Prudentius (hymn xi. v. 170–180), show him to have been tainted with the Novatian heresy, or rather, although somewhat earlier, with the same opinions which in Novatus were condemned as heretical, and which eventuated in the Novatian schism. The validity of this plea, however, is strongly controverted by Bunsen. The works of Hippolytus, which are numerous, and which comprise dogmatical, exegetical, ascetic, and chronological treatises, were first published in a collected form by Fabricius, at Hamburg, 1716–18. They are also found in the second volume of Gallandus.—See Bunsen's *Hippolytus and his Age* (1852; 2d ed. 1854); Miller's *Origenis Philosophumena* (Oxford, 1851); Döllinger's *Hippolytus und Kallistus* (Regensburg, 1853); Wordsworth's *St. Hippolytus and the Church of Rome in the Third Century* (Lond. 1853).

HIPPOL'YTUS, in Grecian mythology, the son of Theseus whose stepmother fell in love with him and accused him to his father because he was indifferent to her. Theseus caused Hippolytus to be murdered; but afterwards learned that he was innocent, whereupon the stepmother, the wicked Phædra, took her own life. The Romans asserted that Hippolytus was restored to life and was worshiped under the name of Virbius.

HIP'POMANE. See MANCHINEEL.

HIPPONAX, OF EPHESUS, a poet placed third, after Archilochus and Simonides, among the classic iambic poets of Greece. Expelled from Ephesus 540 B.C. by the tyrants Athenagoras and Comas, he took refuge in Clazomenæ. There his deformed figure and malicious disposition exposed him to the caricature of the Chian sculptors Bupalus and Athenis; and he revenged himself by issuing against them a series of bitter satires. These are in thought and execution much inferior to the similar works of his predecessor, Archilochus. His coarseness of thought and feeling, his rude vocabulary, his want of grace and taste, and his numerous allusions to matters of merely local interest, prevented his becoming a favorite in Attica. He invented epic parody, and the four opening lines of a parody on the *Iliad* have been preserved in Athenæus (xv. 698 B). He was also the inventor of a peculiar meter, used after him by many writers, known as the scazon or choliambus, which substitutes a spondee for the final iambus of an iambic senarius. [From *Encyc. Brit.*, 9th ed.]

HIPPOPHAË. See SALLOW-THORN.

HIPPOPH'AGI ("eaters of horse-flesh," from Gr. *hippos*, a horse, and *phagein*, to eat), according to the accounts of the old geographers, were a Scythian people, living n.e.

of the Caspian sea, where roam, at the present day, the Kalmuck hordes, who, retaining all the peculiarities of the old Scythians, still regard horse-flesh as a dainty. In Europe repeated attempts have been made in modern times to introduce the practice, but a public *taste* for horse-flesh has not yet been created, except partially in France.

HIPPOPH'AGY (Gr. *horse-eating*). The adoption of horse-flesh as food for man has at various times occupied the attention of physicians. That semi-civilized nations eat horse-flesh is well known. Witness Sir John Chardin's account of the Crim-Tartars. In Spain, a banquet, comprising roasted horse-flesh among the viands, was given in the time of Charles V.; and foal's flesh is eaten in some of the hill districts at the present day.

In 1855 and 1856 there was a good deal of discussion in Paris relative to the formal introduction of horse-flesh into the meat-markets. M. Geoffrey St. Hilaire delivered a lecture declaratory of the wholesome character of this food; and some of the more enthusiastic advocates of the plan formed themselves into a so-called hippophagic, or horse-eating society. The French are famous for their skill in so modifying the operations of cookery as to obtain as many varieties of flavor as possible with any and every kind of meat; and this skill was exercised abundantly in disguising (if not removing) the somewhat coarse taste and odor of horse-flesh. The journals of the time spoke of banquets held by the hippophagi, in which the principal dishes were horse-flesh, variously cooked and diversified.

In 1866 there was official recognition of the introduction of this kind of food into the market, under such restrictions as were deemed suitable. According to a statement in the *Journal of the Society of Arts*, the prefect of the Seine issued an ordonnance in June of that year, recognizing horse-flesh as human food, establishing special slaughter-houses or abattoirs for it, and laying down detailed regulations. No ordinary horse-slaughterers, but only those specially appointed, are to engage in the trade. The animals are to be killed in presence of a veterinary inspector, who is also to stamp or seal every distinct joint of meat after inspection. Unhealthy horses are excluded from the supply; they may be old, and worn out for work, but still healthy (the supply mostly comes from Normandy). All restaurateurs who use horse-flesh in their potages, bouillis, etc., are to acquaint their customers distinctly with the fact. Within a few weeks after the issue of the ordonnance, there were establishments for horse-flesh bouilli and soup, and others for horse-flesh sausages, in Paris, avowedly sanctioned by the authorities. The decision pronounced upon the better portion of horse-flesh, by the medical men of Paris, is that it bears some such relation to ox-beef as brown bread does to wheaten—quite as wholesome, but not so pleasant in taste. During the French international exhibition of 1867 some of the humbler restaurants of Paris made great use of horse-flesh; so that when, during the siege of Paris in 1870–71, horse-flesh was so extensively used as food, it was by no means a novelty to the Parisians.

In London a dinner was given, in 1868, to 160 guests at the Langham Hotel, to test the qualities of horse-meat. It was devised by Mr. Bicknell, cooked by M. Castel, and presided over by Mr. Forsyth, Q.C. Known by their French names, the horse element in the dishes comprised "consommé de cheval," "huile hippophagique" (as a sauce for sole), "terrines de fois maigre chevalines," "saucissons de cheval," "aloyau de cheval farci," "culotte de cheval braisée," "petits pâtés à la möelle Bucéphale," "poulets garnis à l'hippogriffe," "langues de cheval," "gelée de pied de cheval au Marasquin," "zéphirs sautées à l'huile chevaleresque," "gâteau vétérinaire." Under plain English names were collared horse-head, a baron of horse (weighing 280 lbs.), and boiled withers. In most of the French dishes the taste of horse was almost hidden by condiments, etc., but in the baron it was left nearly unchanged—something between beef and venison. The best was done that could be done; but hippophagy does not seem to be any more popular in England than before that experimental banquet was given.

During 1866 and 1867 the Parisians did not avail themselves largely of the official permission to establish abattoirs and shops for the sale of horse-flesh; but by the beginning of 1868 there were twenty butchers' shops in which nothing but horse-flesh was sold; and thus the sale had become considerable, at prices far below that of beef. During the siege of Paris by the Germans, in the later weeks of 1870 and early in 1871, the magnificent halles centrales displayed more horse-flesh than any other kind of food. Horse-broth formed the basis of all the soups, even at the most expensive hotels and restaurants. A horse-steak at an ordinary restaurant was charged four francs.

There has been something achieved also in France in feeding poultry with this kind of diet. One establishment was described, in 1864 (in the *Journal* above quoted), as covering 30 acres, furnishing accommodation for 100,000 pullets at one time. The horses were slaughtered in abattoirs built for the purpose; the hides, hoofs, heads, marrow, bones, hair, intestines, tendons, and blood were sold to various manufacturers; the flesh was boiled, and chopped into small pieces as poultry food, and the refuse was valuable as a rich manure.

HIPPOPOT'AMUS (Gr. *river-horse*), a genus of pachydermatous quadrupeds, constituting a family by itself, and of which, until very recently, only one species was known as now existing, although the fossil remains of others indicate the greater abundance and wider distribution of the form in other periods of the earth's history. The largest

and best known species, *H. amphibius*, is—or, within historic periods, has been—found in almost all parts of Africa, to which quarter of the globe it is entirely confined. A smaller species, *H. Liberiensis*, has recently been described as an inhabitant of the rivers of western Africa within the tropics, and is said to differ remarkably from the common species, and from all the fossil species, in having only two incisors, instead of four, in the lower jaw. The common hippopotamus is one of the largest of existing quadrupeds, the bulk of its body being little inferior to that of the elephant; although its legs are so short that its belly almost touches the ground, and its height is not much above five feet. It is extremely aquatic in its habits, living mostly in lakes or rivers, often in tidal estuaries, where the saltness of the water compels it to resort to springs for the purpose of drinking, and sometimes even in the sea, although it never proceeds to any considerable distance from the shore. Its skin is very thick—on the back and sides more than 2 in.; it is dark brown, destitute of hair, and exudes in great abundance from its numerous pores a thickish oily fluid, by which it is kept constantly lubricated. The tail is short. The feet have each four toes, nearly equal in size, and hoofed. The neck is short and thick. The head is very large, with small ears, and small eyes placed high, so that they are easily raised above water, without much of the animal being exposed to view. The muzzle is very large, rounded, and tumid, with large nostrils and great lips concealing the large front teeth. The hippopotamus cuts grass or corn as if it were done with a scythe, or bites with its strong teeth a stem of considerable thickness neatly through. The skull, while it is distinguished by remarkable peculiarities, corresponds in the most important characters with that of the hog. The respiration of the hippopotamus is slow, and thus it is enabled to spend much of its time under water, only coming to the surface at intervals to breathe. It swims and dives with great ease, and often walks along the bottom, completely under water. Its food consists chiefly of the plants which grow in shallow waters, and about the margins of lakes and rivers; and it probably renders no unimportant service in preventing slow streams from being choked up by the luxuriance of tropical vegetation, the effect of which would, of course, be an increase of the extent of swampy land. It often, however, leaves the water, chiefly by night, to feed on the banks, and makes inroads on cultivated fields, devouring and trampling the crops. It is a gregarious animal, and the havoc wrought by a herd of twenty or thirty is very great; so that wherever cultivation extends, war is waged against the hippopotamus, and it disappears from regions where it formerly abounded. Thus it is no longer found in Lower Egypt, although still abundant further up the Nile. It is taken in pits, which are digged in its usual tracks; it is killed by poisoned spears, is pursued by means of canoes, is harpooned, and is shot with the rifle. The flesh is highly esteemed; the fat, of which there is a thick layer immediately under the skin, is a favorite African delicacy, and when salted is known at the cape of Good Hope as *zee-koe speck*—that is, lake-cow bacon. The tongue, and the jelly made from the feet, are also much prized. The hide is used for a variety of purposes, and the great canine teeth are particularly valuable as ivory, and are a very considerable article of African commerce.

The hippopotamus is lively and playful in its native waters; it soon learns to avoid man, and when it cannot retire among reeds for concealment, it dives and remains long under water, raising only its nose to the surface when another breath becomes necessary. The female hippopotamus may sometimes be seen swimming with her young one on her back. The hippopotamus is generally inoffensive, but is occasionally roused to fits of rage, in which it becomes extremely dangerous, particularly to those who pursue it in boats. The voice of the hippopotamus is loud and harsh, and is likened by Burckhardt to the creaking and groaning of a large wooden door. That the hippopotamus is capable of being tamed, and of becoming much attached to man, has been sufficiently proved by the instances of living specimens in London and Paris. The first hippopotamus brought to Europe in modern times, a young one from the Nile, arrived in London in 1850. The hippopotamus, however, sometimes appeared in the spectacles of the ancient Romans. It is very generally supposed to be the behemoth of the book of Job.

Fossil species.—Some six species of hippopotamus have been described from the later tertiary strata—the pliocene and pleistocene of Lyell. They occur in fresh-water marls, and in the bone-caves, into which they had been carried for food by the carnivorous animals that used the caves as dens. One species found in England, and in considerable abundance in the southern countries of Europe, was of a size as much greater than the living species, as its companion, the mammoth, was greater than the living elephant.

HIPPOTHE'RIUM. See HIPPARION.

HIPPU'RIC ACID ($C_{18}H_8NO_5,HO$) is a compound of great interest both to the chemist and to the physiologist. It derives its name from its having been first discovered in the urine of the horse, and that fluid, or the renal secretion of the cow, affords us the best and readiest means of obtaining it. The crystals of hippuric acid are moderately large, colorless, but subsequently becoming milk-white, four-sided prisms, which are devoid of odor, but have a faintly bitter taste. They dissolve readily in boiling water and in spirit, but are only sparingly soluble in cold water and in ether.

Its chemical bearings show that hippuric acid is intimately associated with benzoic acid on the one hand, and with glycine (or glycocol) on the other. The acid is a product of the metamorphosis of the bodily tissues, especially of herbivorous animals. It is a normal constituent of the urine of the horse, cow, sheep, goat, hare, elephant, etc., and most probably is to be found in the urine of all vegetable feeders. In the human urine of healthy persons living on an ordinary mixed diet it occurs in very small quantity, but it is increased by an exclusively vegetable diet, and in the well-known disease diabetes.

Although hippuric acid usually occurs in mere traces in human urine, we can artificially produce it at will in the body, and cause it to be eliminated in comparatively large quantity by the kidney. If we swallow benzoic acid, it seems to take up glycine or the elements of glycine in its passage through the system, and thus to form hippuric acid, which appears abundantly in the urine. The hippuric acid occurring in the animal organism exists in combination with bases, and chiefly as hippurate of soda and hippurate of lime. The last-named salt can be obtained by the mere evaporation of the urine of the horse.

HIPPURITES, a very remarkable genus of fossil bivalve shells, peculiar to the cretaceous strata, and so abundant in some of the lower chalk beds of the Pyrenees and other places, that the series has received, from some continental geologists, the name of hippurite limestone. The external form of the shell is so anomalous, that the genus has been tossed about by naturalists in an extraordinary manner; some have called it a coral, others an annelid, others a balanus, but the majority hold it to be a mollusk, differing, however, among themselves whether it is a brachiopod, a conchifer, or a cephalopod. The true relation of the genus has been lately determined by Mr. S. P. Woodward, who has published a full description of its curious and anomalous structure in the *Journal of the Geological Society*, vol. xi. p. 40. He has shown that it is a lamellibranchiate mollusk. The lower and fixed valve is produced and tapering, in some species reaching a length of more than a foot. On the one side are three furrows, representing the siphonal, muscular, and ligamental inflections of the shell. The upper and free valve formed a flat covering to the large lower valve. Sixteen species have been described.

HIRAM, a village in Portage co., Ohio, on the Atlantic and Great Western railroad; 33 m. s.e. of Cleveland; pop. of township, 1234. The village is the seat of Hiram college.

HIRAM (Heb. *Chiram*, high-born), King of Tyre, and contemporary with David and Solomon. He was David's friend and ally, and assisted him in the building of his palace with contributions of timber and labor. He also sent cedar and other timber, and skilled workmen for the building of the temple, and gave 500 talents for its adorning, being offered in return 20 towns in Galilee, which, however, he refused to accept. Later Jewish writers say that, because Hiram was a God-fearing man and helped the building of the temple, he was received alive into paradise; but after he had been there a thousand years he sinned through pride, and was cast into hell. Another Hiram, son of a widow of the tribe of Dan, is conspicuous in masonic traditions.

HIRING is a contract by which one employs, for a limited time, another's property or labor for some consideration or reward. Where the thing hired is land or houses, see LANDLORD AND TENANT. In the Roman law, hiring was divided into—1. *Locatio rei*, or the hiring of a thing; 2. *Locatio operis faciendi*, or the hiring of work and labor; 3. *Locatio custodiæ*, or the hiring of care and services to be performed or bestowed on the thing delivered; 4. *Locatio operis mercium vehendarum*, the hiring of the carriage of goods from one place to another. These phrases are still sometimes employed both in the law of England and Scotland, but the subjects are more conveniently treated under other heads: see INN, LODGINGS, SERVANTS, CARRIERS, SHIPPING. The only branch of the subject which seems to fall properly under this head is the hiring of task-work or job-work. Sometimes it is difficult to establish a contract of this kind, but in general there must be either an express or implied contract to pay for the services. Thus, if A, seeing B's horse running away, at some expense catches it, and brings it back to B, there having been no contract or engagement on B's part to pay, he is not bound to pay A for his services, however beneficial they have been, nor can A keep B's horse till such expenses are paid. So, if B has deposited a chattel with A, who has incurred extraordinary expense in preserving it, B is not bound to pay anything. In the Roman law, however, and in the law of Scotland, A could keep the horse or chattel till he was repaid his expenses, or he could sue B for these. In England, however, there must at least be some implied request or contract. When a person is hired to do a thing in a given time, and takes much longer, or deviates from the contract, he is nevertheless entitled to be paid for his services, for the contract is not rescinded on these grounds, unless there was an express stipulation to that effect. During the progress of the contract, it is sometimes material to know which of the parties bears the loss in case of fire. It is difficult to lay down the rule in such cases, for everything depends on the nature of the contract. Whoever is the owner, in law, of the material at the time, bears the loss of it by an accidental fire. If, for example, a tailor engage to make a coat and to furnish the materials for a fixed sum, this is, in fact, two contracts—viz., a sale of the materials, and also work and labor bestowed on them; and in case of destruc-

tion of the subject before completion, the loss of the materials falls on the hirer, and the loss of the labor falls on the workman. So if a printer engaged for a fixed sum per sheet to print and complete a book, the hirer would bear the accidental loss of the paper, and the printer the loss of his labor and skill. Much, however, depends in all these cases on the terms of the contract. Where a workman engages to do work, he impliedly warrants to have reasonable skill: otherwise, if the work is useless, he cannot recover his money. In the case of robbery while goods are in the hands of a workman to work up, if the robbery resulted from his negligence, he bears the loss. So if he merely lost it. In case of a horse or chattel being hired, and accidental damage done, the *onus* in England lies on the owner to prove negligence in the hirer; but in Scotland the contrary rule prevails, and it lies on the hirer to prove he used due care.

HIRING (*ante*), in the United States, is a simple contract to do a certain thing for compensation, and all such transactions come under the legal regulations concerning contracts. If the party hiring out is incompetent, or neglectful, or loses or wastes property, wages may be withheld and discharge may ensue. In most of the states a person breaking a contract for service without reasonable cause can recover nothing, but in some states he can recover the actual value of his service. In case of a discharge before the end of the contracted time, if the person discharged is ready to perform the specified duty he can recover pay for the full period. In the hiring of chattels the person hiring is bound to use all reasonable care for the preservation of the article hired. He cannot dispose of it, for a mere hiring does not convey a title. If the hirer uses the article or animal for purposes not contemplated in the hiring, the owner may repossess and perhaps recover damages. In a general way it may be accepted that the obligations of the one who hires a thing and the one who lets it are on the basis of a plain contract, and it is understood that the purposes, services, and compensation have previously been agreed upon.

HIRPINI, a people of Italy who inhabited the s. portion of Samnium. They have been considered by some authorities as merely a Samnite tribe, while by others they are looked on as an independent nation. The country they inhabited was the wild and mountainous district traversed by the Sabatus, Calor, and Tamarus, tributaries of the Vulturnus, and on the e. side of the Apennine ridge, the upper course of the Aufidus. In the early history of Rome the Hirpini are found identifying themselves with their Samnite neighbors against their common foes. They seem to have been subdued in the early part of the 3d c. B.C., as in 268 B.C. Beneventum, the key of all their military positions, was colonized by Roman settlers. They appear in history for the first time as an independent people after the second Punic war. Revolting from their old conquerors, they joined the Carthaginian invaders, and though they were unable to recapture their stronghold of Beneventum, they remained faithful to Hannibal till the defeat at the Metaurus restored the empire of Italy to his opponents. In the year of that event the Hirpini made peace with their old masters by betraying into their hands the garrisons of their allies. From this time till the outbreak of the social war, the Hirpini seemed to have continued steadfast in their allegiance. On that occasion, however, they set the example of revolt to the allies, and might have become formidable enemies, had not the rapid successes of Sulla induced them to repair their error by a complete submission. At the close of this war the Hirpini obtained the franchise, and do not again appear in history as an independent people. Their chief towns were Beneventum, Aeculanum, Trivicum, Equus, Tuticus, Murgantia, and Aquilonia.

HIRSCH'BERG, an important manufacturing t. of Prussia, in the province of Silesia, is romantically situated at the foot of a mountain, and at the confluence of two streams, the Bober and the Zacken, 30 m. s.w. of Liegnitz. The town is ancient, and is still girt about by a double line of walls. Its Protestant church, a Gothic edifice, is worthy of mention for its beauty, its magnitude, and its excellent organ. Hirschberg is the center of the extensive linen and other manufactures of the district. Pop. '75, 12,970.

HIRST, HENRY B., 1813–74; b. Philadelphia; became a lawyer and for some time a merchant, but better known as a writer of verses. He published *The Coming Mammoth, the Funeral of Time; Endymion, a Tale of Greece;* and *The Penance of Roland, and other Poems.*

HIRTIUS, AULUS, 90–43 B.C.; a personal friend of Julius Cæsar, under whom he served in Gaul, and who, in 46 B.C., nominated him as one of the 10 prætors. After the death of Cæsar he became consul, declared against Antony, and headed a reinforcement for Octavius. While leading an assault he was killed. It is said that he was the author of the eighth book of Cæsar's *Commentaries on the Gallic War.*

HISPA'NIA, the name by which Spain was known to the Romans. According to W. von Humboldt, it is only a modified form of the original name, which he derives from *Expaña*, a Basque word, meaning a "border," or "limit," and which he understands to imply that the country formed the margin of Europe towards the Western ocean. Of the other ancient names of the country, the chief are *Iberia*—the common designation among the Greeks, and believed to denote specially the region of the Iberus (modern Ebro)—and *Hesperia*, on account of its western situation.

Little definite or accurate knowledge of Hispania was possessed before the time of

the Romans. The conquests of the Carthaginians first excited the alarm of the Romans, and led to the struggle on Spanish soil of these two great rivals. The triumph of the Romans, as every reader knows, was ultimately complete, and for the next two or three centuries these indefatigable conquerors set themselves to the thorough subjugation of the whole country. This was finally effected in the time of Augustus, who also founded many Roman cities, adorned with splendid architecture, such as Cæsar Augusta (*Zaragoza*), Emerita Augusta (*Merida*), Pax Julia (*Beja*), Pax Augusta (*Badajoz*), Legio VII. Gemina (*Leon*), etc., and completed the system of military roads across the peninsula, begun 124 B.C. Great numbers of Romans then flocked into the country, and settling there, mixed with the native Iberi, some of whom completely adopted Roman habits, and were spoken of as *Togati*.

To what stock of the human family the old Iberi of Hispania belonged, is one of the *quæstiones vexatæ* of scientific ethnography. That they are now represented by the Basques (q.v.) is universally admitted. Niebuhr holds that Hispania was originally peopled by Celts and Iberi, from a mixture of whom arose the *Celtiberi* (q.v.). The more common opinion, however, both ancient and modern, is that the Celts were not equally aboriginal with the Iberi, but invaders from Gaul, who conquered the latter.

HISPANIOLA (Little Spain). See DOMINGO, SAN, and HAYTI.

HISSAR, the capital of a district of that name in the Punjab, about 100 m. N.W. of Delhi. Pop. '68, 14,133. The district of Hissar has an area of 3,540 sq.m., and its fertile soil produces wheat and other cereals in abundance. Pop. 484,681.

HISTIÆ'A, or OREUS, in ancient geography, an important city of Eubœa, on the N. extremity of the island, and giving name to the district Histiæotis. It was very ancient, and, like most of the old cities of Greece, its origin is doubtful and obscure. At the final expulsion of the Persians from Greece, it passed into the hands of the Athenians, and when Eubœa revolted from that people and was again subdued, the old inhabitants of the town were expelled, and 2,000 Athenian colonists settled in their stead. It was at this date that the city changed its original name for that of Oreus, by which it was afterwards more generally known. At the end of the Peloponnesian war the descendants of the old inhabitants were restored by the Spartans, under whose dominion the city had fallen, and to whom it remained faithful till the battle of Leuctra, when it revolted from them. In the war between Philip and the Greeks, Oreus was frequently contested, and in B.C. 200 it was stormed by the Romans. Under them it gradually fell into decay. Some ruins of its fortifications are all that now remain to tell of its ancient greatness.

HISTOL'OGY (derived from the Greek words *histos*, a web or texture, and *logos*, a discourse) is the science which classifies and describes the structural or morphological elements which exist in the solids and fluids of organized bodies. It is identical or nearly so with general minute anatomy and with microscopic anatomy. Although its origin may be traced to the times of Malpighi (1628–94), who discovered the blood corpuscles, and of Leuwenhoek (1632–1723), who, with comparatively imperfect optical means, added much to our knowledge of the minute structure of the tissues, it never made any definite progress till the second decennium of the present century, when the compound microscope began to assume its present improved form. It was by means of this microscopico-chemical examination that the structure of the different horny tissues was first clearly exhibited, and it was thus proved that nails, cow's horn, and whalebone are similarly composed of aggregations of individual cells. Again, in the investigation of the nervous tissue, and of many other structures, chemistry and the microscope have been most usefully combined.

During the last quarter of a century, no department of medical science has made such rapid progress as histology. In Germany it has been successfully cultivated by Schwann, Henle, Valentin, Remak, Kölliker, Virchow, Leydig, Frey, and a host of others, scarcely less distinguished; in Holland, it has been actively prosecuted by Donders, Harting, and others; Lebert, Mandl, Robin, and others, have contributed to the French literature of the subject; while amongst our own countrymen, the names of Todd and Bowman, of Goodsir, Queckett, J. H. Bennett, Lockhart Clarke, and Beale, deserve honorable notice.

HISTOLOGY (*ante*). Although Malpighi and Leuwenhoek, Ruysch, Lieberkühn, and others, made several discoveries of minute parts with lenses, histology, as a science, did not commence until Bichat brought to bear upon the subject the powers of his generalizing mind, although his work was accomplished with but little aid from the microscope. His great work, entitled *Anatomie générale appliqué à la Physiologie et à la Médecine*, appeared at Paris in 1801. He was the first to classify tissues according to their structure. After Bichat came the epoch of histological research, which was the extension of the microscopic observations of Malpighi and Leuwenhoek in accordance with the general system of Bichat. The discovery of the method of combining lenses so as to render them achromatic gave a new impulse to the study, and a more perfect classification of the tissues of the body was the result, as it placed in the hands of Schwann an instrument which, although a few errors were unavoidable in so new and profound a science, enabled him to demonstrate the law that all tissues have their origin

in cells. This may be called the greatest discovery in histology, and therefore Schwann is often called the founder of the science of histogenesis, or the study of the origin of tissues, more recently pursued with such great success by Reichert, Koelliker, Remak, and others. Then the microscopic anatomy of diseased structures and their mode of development came to be investigated, and the science of pathological histology took its rise. Johannes Müller is regarded as the father of this branch of histology, as he indicated the general direction in which the investigation of diseased growths should be pursued. Afterwards Virchow, in the publication of his celebrated *Cellular Pathology*, added new luster to the science, which has recently been still further enriched by the labors of Bilroth, Rindfleisch, Recklinghausen, Cohnheim, and others. Now the science of histology enables the student to detect the elements of tissues in any organ, and also the first stages in the process of morbid growths by which the cell element gradually undergoes its transformation from a normal and healthy to an abnormal and sometimes malignant factor.

This brief historical notice needs only to be followed by a general view of those elementary tissues which it is the province of the science to investigate, and the study of whose functions forms so large a part of the science of physiology. In general terms, all tissues may be said to consist of cells, of one form or another. In cartilage the cells are globular or ellipsoidal, in the liver polygonal, in connective tissue long and spindle shaped. It was at first supposed that the elementary cell was composed of a little bag filled with fluid or solid matter, but now most histologists regard it as a small globular mass of living matter, or protoplasm, and this may have a nucleus, or exist without it. In regard to the power elementary cells may have of taking on different forms and becoming converted into different tissues, there is no certainty of knowledge. Whether the mature cells which form the various tissues have different natures in the first stages of their existence, or whether they are the results of transformations, cannot, perhaps, be determined; but it is more probable that each organ or tissue is made up of cells that are originally different; and it is by the development of this originally different organism, different not in form, perhaps, in any way that can be distinguished by the senses, but different in nature, that a primordial muscle cell will take to itself nutriment from the blood plasma, and become in time a fully developed muscle cell, and, in connection with the nerves distributed to the part, perform its ordained functions; that a hepatic cell, existing at first as a blastimic point in the evolving organ, passes in the same way through the various stages of its development, till finally it becomes the mature hepatic cell, and never becomes anything else physiologically: it cannot change to any other tissue, unless it passes under the power of malignant disease, and turns to a cancer or a sarcoma cell, or degenerates from loss of vital power. Human tissue elementary cells vary in size, from $\frac{1}{2000}$ to $\frac{1}{10000}$ of an inch in diameter, of a more or less ellipsoidal form, often nearly globular. There are two modes of cell growth, the endogenous, in which young cells form within the parent cell, and the exogenous, which takes place by a process of division; and this forms one of the grounds for believing that the cells of any tissue are always the cells of that particular tissue and no other. The most universal of all the elementary tissues of the body is connective tissue. As its name implies, it forms the connecting bond which holds together the special elements of the several organs, passing between and around them. The cells which form the special part of each organ can generally be distinguished with the aid of the microscope, varying widely in many instances, slightly in others. The organs, however, contain many tissues in common. They may in common have mucous membrane, but the cellular structure of this membrane differs in different organs. So far a special cellular element probably has the power of transformation, adapting itself to circumstances; but such transformation is different from that which would take place if an embryonic cartilage cell became an epithelial cell. Histology not only embraces the study of structural elements, but also elements of composition, or chemical elements, as well of the organs themselves as of their products. In this article no attempt can be made to do more than give an outline of what the science of histology is; the histological elements of many of the parts of the organs of the human body are given under their appropriate titles. Nothing has been said in this place of vegetable histology, although that science has existed longer, perhaps, than animal histology, and, being more simple, has been carried almost to perfection, while animal histology is scarcely out of its infancy; at least it is so immature that the results of its final development cannot be foretold.

HISTORY, a narrative of events and of the lives and acts of men, of families, of tribes, and of nations. History first took the form of tradition, and was handed down orally from generation to generation. Much of this tradition was obscure and mythical, assuming the form of religious belief. Written history is as old as the invention of letters, and among the earliest monuments were sculptured inscriptions and records of the acts of rulers, especially their victories. The oldest known historical writings are on the moncliths, temples, and pyramids of Egypt, the cuneiform inscriptions of Assyria, and those found in the ruins of ancient Greek and Phenician towns. The history of ancient Egypt, so far as recorded, extends from about 4,000 years to 700 B.C., about the time of the dissolution of the empire. Near the close of the 5th c. B.C., Herodotus, the

"father of history," was born, and his works are, so far as known, the earliest that can be classed under the name. It is usually supposed that he wrote, or meant to write, a universal history, but such was not the result; it was rather a partial history of the wars between Greece and the barbarians, with incidental geographical information attached.

Thucydides, the second great historian, was of a different order of mind. He approached the study of history from a philosophical standpoint, endeavoring to explain the actions which he recorded, while Polybius enlarged and improved upon the plan of Thucydides. The historians of Greece and Rome usually confined themselves to plain narrative, as Xenophon in his *Anabasis*, Cæsar in his *Commentaries*, and Livy in his more extended history. Tacitus alone showed distinct purpose in his work, lending his genius to the portrayal of tyranny in its blackest colors. Eusebius was the first great ecclesiastical historian. Procopius can be regarded only as a chronicler, neither scrupulous nor exact in his stories. Few historians appeared between the fall of the Roman empire and the middle ages, but the mental activity of the 12th c. and the invention of printing brought many into the field, and as facilities increased and the intercourse between nations became more frequent, we find a corresponding tendency towards historical writing. In regard to style, Macchiavelli and Guicciardini were long considered models of composition. Later historians, however, while imbibing the spirit of their writings, formed styles of their own, in accordance with the prevailing tendencies of their respective ages. De Thou in France, Mariana in Spain, Strada, the Dutch historian of the Low Countries, and sir Walter Raleigh, with his wonderful chronicles of fresh discovery, are all authorities to be recognized and consulted, while in more modern days appeared Hume and Robertson, and the greater Gibbon, the writer of the *Decline and Fall of the Roman Empire*, one of the most stupendous historical works ever produced.

The tendency of modern history is critical rather than merely narrative. Philology and archæology have very materially altered the reading of the histories that have come down to us, and in which the world has placed implicit faith. When the Bible is subjected to the ordeal of a new translation, we can hardly expect human history to escape. But if much that we have hitherto accepted as substantial is found to be mythical, it by no means follows that the main facts of history, as we have received them, are likely to be overthrown. Many of the histories written within the last half century are wonderful monuments of critical research. Authors are no longer content to accept the popular relation of occurrences without at least endeavoring to understand the motives which led to them and the effects produced by them. In these days the historian is no longer a mere reporter; he must be prepared to analyze character and to weigh events. He must seek his materials at the fountain-head, must compare the private with the public actions of the characters he portrays, and present to his readers a picture of men and women which shall be accurate in minute detail, and yet embrace the remoter consequences of their actions.

The origin of history may be attributed to that spirit of conservatism, largely inherent in human nature and readily developed in the progress of civilization, which incites to the preservation of a record of human life, its acts and occurrences. Our familiarity with the past is derived in the first instance from tradition, and later through the perpetuation of tradition and also of contemporary occurrence, by means of mural or monumental sculptures, inscribed tablets, or such other means as were feasible to those who desired to form the record. Naturally the first efforts in this direction were towards the preservation of a narrative of single events. These were sometimes incidents in natural phenomena of a startling nature—as floods, earthquakes, eclipses, etc.—and at others relations of momentous events in the lives of prominent individuals, usually potentates or wise men. Restricted by the means at hand, such a record was of course for a long time fragmentary and episodic. Bricks or tablets, the walls of buildings, and monumental piles served for the material, as symbolic or representative figures of birds, animals, and other suggestive objects answered for the manner. The first step in advance was taken when the discovery of the possible use of papyrus gave opportunity for the introduction of the elements of continuity and sequence into the preservation of intelligence, and actual *history* began. At first this took the form of annals, or chronicles, and it was not until after the middle ages that this form was abandoned for a more philosophical and systematic method of construction. And certainly the most charming and instructive works which undertake the purpose merely of bringing the future into contact and acquaintance with the past are those of the chroniclers of the middle ages. The names of Froissart, Monstrelet, Geoffrey of Monmouth, Matthew Paris, Holinshed, and the rest, should be remembered with reverence, and their writings studied with earnest appreciation. For these were the men who revived the historic element, after it had lain dormant during the stagnant period of the dark ages. To them, groping conscientiously, but naturally infused with the superstition and credulity of their time, we are indebted—not only for the histories which they wrote, after much severe and painstaking labor, but also for the encouragement which they afforded to future writers, and for the existence of the later and greater historical efforts which they made possible. And it would be doing injustice to a most important class of workers not to mention the writers of *memoirs*. It is to the authors of

the long series of works of this character, covering a large portion of the history of France, that we owe the preservation of a knowledge of events, and of the character of prominent personages, absolutely essential to the writing of a complete French history. Indeed those mousing investigators who spend their lives in searching out the truth of narration, in recording anecdotes and current manners and customs, and in generally contemplating the minor details of life with a view to the preservation of some accurate account of them, are of inestimable service to the historian. History, however, is of two kinds—narrative and philosophical. And it should be remembered that of these two species of history the latter is far the more important. "History," we are told, is "philosophy teaching by example." Merely narrative history is of no value whatever, of however much interest it may be in the way of satisfying a perfectly justifiable curiosity, except in so far as it teaches the lessons afforded by experience, and enables succeeding generations to profit by the lives of those which preceded them. It is, therefore, that species of history whose deductions from the events it records serve as a basis for the discovery and formulating of natural social laws, that possesses real value for humanity. Modern, like ancient, historians have generally become more justly famous for the vigor or polish of their style, the care they have displayed in the collection of their material, and the comprehensiveness of their design, than for philosophical analysis of the natural causes and bearing of the actions of men. Henry Thomas Buckle and Herbert Spencer are instances of the philosophical historian, as Sismondi, Thiers, Michelet, Hume and Smollett, and Bancroft are of the strictly narrative. Such writers as Macaulay, Prescott, Motley, and Froude have displayed the romantic side of history, and have discovered the possibilities of language in rendering its record glowing and fascinating, without departing from the limits of veracity. As history is but the combination and interweaving of human biography, it follows that works of a biographical character are among the most important implements of the historian. So also the division of history by classification—as of literature, ecclesiastical, history of art, bibliography, which is the history of books, etc.—aids greatly in modifying the mechanical labors of the historian, and enables him to give more time and thought to the philosophy of the events and lives he chronicles, and thus evolve from them their true merit, and usefulness to man.

HIT (the *Is* of Herodotus), a t. of Turkey in Asia, is situated on the right bank of the Euphrates, in the pashalic of Bagdad, and 110 m. w.n.w. of the city of that name. It is estimated to contain about 1500 houses, and is remarkable for the fountains of bitumen in the neighborhood. These fountains or pits are as abundantly productive at the present day as they were in the earliest ages. From them bitumen and naphtha are obtained in great quantity, and exported.

HITCH, a knot or noose by which one rope is fastened to another, or to some other object, as a hook, a cleat, a ring, etc. There are many sorts of hitches—as clove-hitch, midshipman's hitch, rolling-hitch, etc. Several of these knots will be described and figured under KNOT.

HITCHCOCK, a co. in s.w. Nebraska, on the Kansas border, intersected by Republican river; 720 sq.m.; pop. '80, 1012. The surface is chiefly prairie. Co. seat, Culbertson.

HITCHCOCK, EDWARD, D.D., LL.D., an eminent American geologist, b at Deerfield, Mass., U. S., May 24, 1793; was head of the academy in his native place, 1815–18; pastor of the Congregational church at Conway, 1821–25; professor of chemistry and natural history in Amherst college, 1825–45; principal and professor of natural theology and geology, 1845–54; and was principal till shortly before his death, Feb. 27, 1864. In 1824 he published *The Geology of the Connecticut Valley* a work which was well received, and opened the way to Hitchcock's advancement. He was appointed a state geologist, and as such made a thorough survey of the geology and mineralogical resources, including also the botany and zoology, of Massachusetts, in 1830; of part of New York in 1836, and of Vermont in 1857. He published the fruits of his researches regarding Massachusetts in 1831; and after issuing supplementary reports in 1833 and 1838, embodied the whole in his *Final Report on the Geology of Massachusetts* (2 vols. 1841), which is the standard work on this subject. In 1850 Hitchcock was appointed agricultural commissioner for his native state, and received instructions to visit and examine the chief agricultural schools of Europe, which he did; and subsequently published his *Report on the Agricultural Schools of Europe*, a valuable work. But he chiefly distinguished himself in the geological department of natural theology. His work on the connection between geology and religion—*The Religion of Geology and its connected Sciences* (1851)—has had a very wide circulation on both sides of the Atlantic. Hitchcock came forward prominently as an expositor of the fossil footprints in the Connecticut valley. The most important of his works, besides those mentioned above, are *Elementary Geology, with an Introductory Notice by Dr. Pye Smith* (1840), a work which has become extremely popular, having gone through 25 editions in America and 9 in England; *Fossil Footmarks in the United States* (1848); *Ichnology of New England* (1858); *Report on the Geology of Vermont* (1861).

HITCHCOCK, ETHAN ALLEN, b. Vt., 1798; a graduate of West Point, and instructor of infantry tactics. He served in the Mexican war, and afterwards com-

manded the military division of the Pacific. In the war of the rebellion he was maj.gen., of division and was one of the commissioners for interchange of prisoners. He was also one of the commissioners for the revising of the military codes. He has published *Remarks on the Alchemists; Swedenborg a Hermetic Philosopher; Christ the Spirit*, etc.

HITCHCOCK, Roswell Dwight, D.D., LL.D., b. Maine, 1817; graduated at Amherst, where he was afterwards a tutor. In 1845 he became pastor of a Congregationalist church; in 1852 professor of natural and revealed religion in Bowdoin college, and in 1855 professor of church history in the New York Union theological seminary. In 1871 he was chosen president of the Palestine exploration society. He was one of the editors of the *American Theological Review*, and has published a *Complete Analysis of the Bible*, and other works. In 1880, after the death of rev. Dr. William Adams, Dr. Hitchcock was chosen his successor as president of the seminary in which he is also a professor.

HITCHCOCK, Samuel A., 1784–1873; b. Mass.; the founder of the Hitchcock free high-school at Brimfield, and a liberal giver to Amherst and other colleges and to various charities. He gave in all more than $650,000.

HITCHIN, a t. of Hertfordshire, England, 14 m. n.w. from Hertford, on the Hiz, a branch of the Ivel and feeder of the Ouse, 420 ft. above the sea. It is a station on the Great Northern railway, and from it important lines of railway branch off to Bedford and other places on the n.w., and to Cambridge, etc., on the n.e. The town is irregularly laid out, but generally well built, with spacious streets. The principal trade is in corn, malt, and flour. There are several large breweries. Many females are employed in straw-plaiting. There are lavender-farms in the neighborhood. Hitchin was a place of some consequence in the days of king Alfred. Pop. '71, 7,630.

HITOPADE SA (literally "good advice," or "salutary instruction," from the Sanskrit *hita*, good, salutary, and *upadesa*, advice, instruction) is the name of the celebrated Sanskrit collection of fables, the contents of which have passed into almost all the civilized literatures of the earth. The collection itself, in the form in which we possess it, is founded on older works of a kindred nature, and is classed by the Hindus among their ethical works. See Sanskrit Literature.

HIT TEREN, a considerable island on the w. coast of Norway, lies about 47 m. w. of the town of Trondhjem, and is about 30 m. long by 10 m. broad. Pop. about 3,700, most of whom live by fishing.

HITTITES, the descendants of Heth, one of the children of Canaan, the grandson of Noah. I. *Notices of them in the Scriptures.* In the account of the settlement of nations after the flood the Canaanites are said to have been "spread abroad" and to have extended over the land of Palestine from Sidon on the n. to Gaza on the south. Their subsequent history shows that their spreading abroad was also far beyond those bounds. The children of Heth sold the field and cave of Machpelah to Abraham. Two of the daughters were wives of Esau. Among their towns one was named "the city of instruction" and "the city of the book"—titles implying an acquaintance with letters, and remarkable in connection with the inscriptions by which the course of their migrations is now traced. At the time of the conquest of Canaan by Joshua they are mentioned as among the possessors of the land, dwelling with the Jebusites and Amorites in the mountains, and extending their dominions to the river Euphrates. At a later day two of them are named among the personal attendants of David: Ahimelech, who went down with him into the camp of Saul, and Uriah, who was one of the thirty that constituted his guard. Solomon imposed tribute on them in common with other Canaanitish nations. In his day it is recorded that they were accustomed to buy horses and chariots in Egypt. That they continued in Palestine during and after the captivity appears from the statement in Ezra that some of the returned Jews married Hittite women. Though no particulars are recorded in Scripture concerning their religion, its idolatrous character is declared, since among Solomon's idolatrous wives Hittite women were included, and on the tribe, in common with the other inhabitants, are charged the abominations that defiled the land.—II. *Notices found in ancient inscriptions.* 1. On Egyptian monuments, in the time of Rameses II., 1306 B.C., Hittites are conspicuous among the eastern enemies of the Egyptians. This portion of them corresponds with those who are spoken of in Scripture as living beyond the bounds of Palestine. One of their cities, called Kadesh, "the holy," was near a lake, now named Kedes, fed by the Orontes s. of Emesa. The city is also described as being in the land of the Amorites, to which Carchemish, too, on the w. side of the Euphrates, belonged. Their country, consequently, was in the valley of the Orontes. Rameses II. boasted that he defeated this people with their allies, and commemorated the so-called victory on a papyrus roll, as well as by sculptured inscriptions, in which many tribes are mentioned as allied together who evidently did not dwell in Palestine. The Hittites are represented as having a regular army composed of disciplined infantry, cavalry, and 2,500 chariots, each drawn by two horses, and carrying a charioteer and two warriors. This army contained men of two tribes, one bearded and the other smooth-faced, and differing in dress and arms; yet both described under one name and as united in a common

cause. The fact, however, that in the 21st year of Rameses II. the great king of the Hittites went to Egypt and made a treaty of peace seems to favor the claim set up for the allies that they were not defeated by the Egyptian king but, on the contrary, forced him to sign a treaty, the terms of which were not unfavorable to them. A copy of a treaty, preserved in a hieroglyphic inscription, gives some information concerning the religion of the Hittites, describing their gods of war, of women, of mountains and rivers, with special mention of Ashtaroth in connection with a god of another name that corresponds with Baal. 2. In the Assyrian inscriptions there are references to a nation having a name that corresponds with the Hittites, and consisting of a confederacy ruled by 12 chiefs. Their territory was in the valley of the Orontes, and they were aided by people of the sea-coast, probably the Phenicians. Inscriptions, in what are recognized as Hittite characters, have been found on clay impressions of seals in Sennacherib's palace at Nineveh; in the walls of buildings at the ancient Hamath; in a rock-sculpture at Ibreez, in Lycaonia; at Carchemish; at Boghaz Keui and Eyuk, on the eastern side of the Halys; at Ghiaur Kalessi, in Phrygia; at Karabel, in Lydia; in the Taurus; and near Antioch. These various monuments indicate that the Hittite empire once extended from Carchemish, their capital, to the shores of the Ægean; and that two roads traversed it: one used by Crœsus in his march against Cyrus, and the other, along the s., the route of Xenophon and "the ten thousand." As the Assyrian empire rose that of the Hittites declined. Their provinces in Asia Minor were lost first, and afterwards their possessions in southern Syria. Kadesh on the Orontes, once their capital, and Hamath fell into Semitic hands; and, at last, Carchemish was taken by Sargon, 717 B.C. The double eagle is shown by the sculptures to have been a Hittite symbol. It was adopted by the Seljukian sultans in the 11th c., was brought to Europe by the crusaders, and used by the German emperor in 1345.

HITTORF, JACQUES IGNACE, 1793–1867; b. Germany; in 1810 a pupil of fine arts in Paris, and in 1818 architect for the government. He was long engaged in the construction of public edifices, such as the church of St. Vincent de Paul, and the embellishment of the Bois de Boulogne and the Champ Elysées. He wrote several works on architecture.

HITZIG, FERDINAND, a German biblical scholar, was b. June 23, 1807, at Hauingen, Baden, and educated at Heidelberg, Halle—where the influence of Gesenius determined him in favor of Old Testament studies—and at Göttingen. In 1833 he was called to Zürich as professor of theology, with a special view to the exegesis of the Old Testament; but his lectures embraced also the New Testament, and the languages of the east, especially the Semitic. In 1861 Hitzig returned as professor to Heidelberg. The first work which established his fame was his *Uebersetzung u. Auslegung d. Proph. Jesaias* (1833). Besides a translation of the Psalms, with a commentary (1835–36), he furnished for the *Exegetisches Handbuch zum A. T.* the commentaries on the twelve minor prophets (1838; 2d ed. 1851), on Jeremiah (1841), Ezekiel (1847), Ecclesiastes (1847), Daniel (1850), and the Song of Solomon (1855), with a translation of all the prophetical books as a supplement (1854). He is also known by *Die Erfindung d. Alphabets* (1840), *Die Grabschrift d. Darius zu Naschki-Rustam* (1845), *Urgesch u. Mythologie d. Philistäer* (1846), etc., and by considerable contributions to periodicals. He died at Heidelberg in 1875.

HIVA-O'A, the principal island of the Marquesas group in the south Pacific ocean, is about 22 m. long by 10 m. broad. Its northern point is said to be in lat. 9° 34′ s., and in long. 139° 4′ west. Pop. stated at 6,500.

HI'VITES ("midlanders" according to Ewald, or "villagers" according to Gesenius), a Canaanitish people, who in the time of Jacob are found occupying the uplands of Ephraim, and later, the slopes of Hermon and the region westward towards Tyre.

HIZEN. A province in Kiushiu, Japan, famous for its porcelain manufactures, which are chiefly at or near Arita (see ARITA); pop. 1,074,461. It contains the large cities of Nagasaki and Saga.

H'LASSA. See LASSA.

HOADLEY, BENJAMIN, D.D., an eminent English prelate, was the son of the rev. Samuel Hoadley, master of the Norwich grammar school, and was b. at Westerham, in Kent, Nov. 14, 1676. In 1691 he entered Catherine Hall, university of Cambridge, where he became tutor after taking his degree of M.A. In 1701 he was chosen lecturer of St. Mildred in the Poultry, London, and from this time began to attract attention as a controversial writer. His *Reasonableness of Conformity to the Church of England*, appeared in 1703, which, like all his other performances, though agreeable to the sentiments of the educated laity of the church of England, was exactly the reverse to the great body of the clergy, both established and dissenting. Next year, he obtained the rectory of St. Peter-le-Poor, London, and was soon after engaged in a controversy with Dr. Atterbury (q.v.) on the extent of the obedience due to the civil power by ecclesiastics. This contest was conducted by Hoadley in such a way as to secure for him the applause of the house of commons, who in their address to the queen (Anne), referred to the important services he had rendered to the cause of civil and religious liberty. In 1710 Hoadley was presented to the rectory of Streatham, in Surrey; and in 1715, when the accession of George I. had secured the triumph of whig principles, was made bishop

of Bangor; but it is affirmed that he never visited this see, for fear of exciting a "party fury." He was, however, far from remaining idle. In 1717 he preached before the king a sermon on the text, "My kingdom is not of this world," in which he endeavored to show that Christ had not delegated his powers to any ecclesiastical authorities. He carried out this idea to great length, and maintained that it was the best and safest ground to take up in attempting to refute both Roman Catholics and dissenters. Hence originated the famous Bangorian controversy, regarding which Hallam says, that it was "managed, perhaps on both sides, with all the chicanery of polemical writers, and disgusting both from its tediousness, and from the manifest unwillingness of the disputants to speak ingenuously what they meant." Hoadley's principal opponent was William Law. Hallam speaks of having read 40 or 50 pamphlets on the question. In 1721 Hoadley was transferred to the see of Hereford; in 1723 to that of Salisbury; and in 1734 to that of Winchester. In 1735 he published a *Plain Account of the Nature and End of the Lord's Supper;* and in 1754–55 two volumes of sermons, which were highly esteemed. He died April 17, 1761, in the 85th year of his age.

HOADLEY, Benjamin (*ante*), 1676–1761; b. England; bishop of Bangor in 1715; of Hereford in 1721; of Salisbury in 1723; and of Winchester in 1734. He attracted much attention at first by his controversy with bishop Atterbury in 1709, when he was rector of Streatham. The house of commons were so pleased with the manner in which he defended himself against the tory Atterbury that Hoadley's name was mentioned in the address to the queen as a champion of liberty, both civil and religious. He developed his principles in his tract on the *Measure of Obedience to the Civil Magistrate.* But in 1714 queen Anne was succeeded by George I., the tories ceased to be in favor at court. In 1715 Hoadley was raised to the bishopric of Bangor; and in 1717 the celebrated *Bangorian controversy* arose. It began by Hoadley's publication of his views on the text, "My kingdom is not of this world;" in regard to which he maintained that Christ had left behind him no such authority as that claimed by churches, and that this was the best way of answering the arrogant pretensions of the church of Rome. These views gave great offense both to high church and dissenters. He was attacked from all quarters. William Law is considered his ablest antagonist. The controversy raged for three years. From his *Discourses on the Terms of Acceptance,* it is obvious that he rejects the five points of Calvinism. He wrote an account of the *Nature and End of the Sacrament,* and a *Letter to Clement Chevalier.*

HOADLEY, John, 1711–76: son of Benjamin; educated at Cambridge, and was chaplain to the prince of Wales, prebendary of Westchester, and rector of St. Mary's. He wrote *Love's Revenge,* a pastoral; *Jephtha,* an oratorio; *Phœbe, and the Force of Truth,* and edited his father's writings.

HOANG-HAI. See Whang-hai, *ante.*

HOANG-HO. See Whang-ho, *ante.*

HOAR, Ebenezer Rockwood, ll.d., b. Mass. 1816; graduated at Harvard, and in 1840 was admitted to the practice of law. He was appointed a judge, but resigned in 1855. Four years later he was made a supreme court judge, and held the seat until 1869, when he became U.S. attorney general, in which office he made many important improvements, raising it to the rank of a district department of the government, known as the department of justice. In 1872 he was elected to congress.

HOAR, George Frisbie, b. Mass. 1816; a son of Samuel; graduated at Harvard in 1835; in 1849 began the practice of law at Worcester. In 1868 he was chosen a member of congress, and was re-elected three successive times. In 1876 he was chosen a senator of the United States. In 1880 he was president of the republican national convention at Chicago for the nomination of president and vice president of the United States.

HOAR, Samuel, ll.d., 1778–1856; b. Mass.; graduate of Harvard, admitted to the bar in 1805, and soon became a conspicuous lawyer. He was in the constitutional convention of 1820; a state senator in 1825; afterwards a state councilor, and in 1835 a member of congress. In 1844 he was sent by the Massachusetts legislature to South Carolina, to dispute before the courts the constitutionality of certain laws of that state authorizing the imprisonment of free negroes coming into the state. He was, however, not allowed to plead, but was forcibly expelled from Charleston by the public authorities, the South Carolina legislature by special act authorizing the expulsion.

HOARE, Sir Richard Colt, 1758–1838; b. England; inherited a large fortune, and turned his attention exclusively to literature and art. He traveled over Europe, Ireland, and Wales, collecting a great number of sketches, and publishing accounts of portions of his tours. His principal work was an elaborate history of Wiltshire, profusely illustrated, which was not completed at his death.

HOARE, William, 1707–92; b. England; a painter of eminence, one of the earliest members of the royal academy. He produced some altar pieces, and portraits of William Pitt, Grenville, and other noted statesmen.

HOAR-FROST. See Dew.

HOARHOUND, *marrubium,* a genus of plants of the natural order *labiatæ,* having a tubular 10-ribbed calyx, with 5 or 10 spiny equal teeth, 4 stamens included in the

corolla, the upper lip of the corolla erect, the lower lip 3-cleft. The species are mostly perennial, herbaceous plants, natives of the s. of Europe and the East. One species, the COMMON or WHITE HOARHOUND (*marrubium vulgare*), is a native of Britain, and is found generally throughout Europe, except in the more northern regions, growing in waste places, waysides, etc. It is about 1—1½ ft. high, bushy, with roundish, ovate, crenate, wrinkled leaves, and almost globose whorls of white flowers. The whole plant has a whitish appearance, from the down with which its leaves are covered. It has an aromatic but not very agreeable smell. It is tonic, stimulant, and laxative, and is much used in coughs, being a popular remedy, and a very safe and efficacious one. It was formerly also employed in affections of the womb and of the liver. It is administered in the form of an infusion, or made into a syrup with sugar, and sometimes the syrup is candied. The name hoarhound belongs also to another plant, a native of Britain, *ballota nigra*, sometimes called black hoarhound, a fetid plant, also of the order *labiatæ*, and of a genus very closely allied to *marrubium*. It closely resembles the white hoarhound in taste, and possesses similar medicinal properties. A third British plant, *lycopus Europæus*, a diandrous plant of the same natural order, is sometimes called WATER HOARHOUND. It is also known as gypsy-wort.

HOARSENESS. See THROAT, DISEASES OF.

HOA'ZIN, or **TOURACO**, *opisthocomus cristatus*, a bird nearly as large as a peacock, which it somewhat resembles it its gait and manners; a native of Guiana and Brazil; generally referred by naturalists to the family *cracidæ* (with curassows and guans) and the gallinaceous order; but by some regarded as of the order *insessores*, and as allied to the plantain-eaters. Its anatomy is remarkable: it has an enormous crop, whilst the gizzard is very small. It is gregarious, and frequents marshy situations.

HOBART, JOHN HENRY, S.T.D., 1775–1830; b. Philadelphia; graduated at Princeton, where he became a tutor, and a student of theology. He was ordained a deacon of the Protestant Episcopal church in 1798, and was subsequently a pastor in New Jersey and on Long Island. In 1812 he was assistant rector of Trinity church, New York, and in 1816 was chosen rector of the church and bishop of the diocese. He was one of the founders of the general theological seminary in which he was professor of pastoral theology. In 1823 he traveled in Europe studying the social and moral condition of the people. In London he published two volumes of sermons directed against the observance of forms to the neglect of essentials. He was a zealous supporter of episcopacy, and opposed the union of denominations and such organizations as Bible and tract societies. Among his works are, *Apology for Apostolic Order*, *The State of the Departed*, and various devotional manuals.

HOBART PASHÁ, admiral of the Turkish fleet, third son of the earl of Buckingham, his real name being Augustus Charles Hobart, was b. April 1, 1822. Entering the British navy in 1836, he distinguished himself in the Crimean war and rose to the rank of captain. Being of an adventurous turn, he took command of a blockade runner during the war of the southern rebellion. In 1867 he offered his services to the sultan, who gave him command of the fleet operating against Crete. He took this step without asking leave of the British admiralty, and in consequence of the remonstrances of the Greek government his name was stricken from the British navy list; but afterwards, upon his own plea that he was serving an ally of the British government, and that he had contributed to maintain the peace of Europe, he was restored to his former rank and placed upon the retired list, with the opportunity of rising by seniority to the rank of a retired admiral.

HO'BART TOWN, the capital of Tasmania, or Van Diemen's Land, stands on the Derwent, near its entrance into Storm bay, on the s. coast of the island. It is in lat. 42° 53′ s., and long. 147° 21′ east. The mean temperature for the year is 52.3°, being 42.1° in winter, and 63.1° in summer. Pop. over 20,000. Besides the government official buildings, Hobart Town has a college and several public schools; and its naturally excellent harbor and noble quay accommodate ships of the largest size. It has considerable manufactures, and railways communication with Launceston.

HOBBEMA, or HOBBIMA, MINDERHOUT, or MINARD, a landscape painter of the Flemish school, b. Antwerp about the beginning of the 17th century. His personal history is a total blank. The only fact in it that can be relied on as even approximately true is that he died at a very advanced age in 1699. His landscapes, which are now rather rare, are extremely simply in their structure; but his management of perspective, and his conduct of chiar-oscuro, enable him to express vast distances in a few square feet of canvas, and to imprint a distinctive and marked character upon the homeliest scenes. His execution is wonderfully careful, yet so well harmonized, and so light and graceful, that each separate piece is in itself a perfect gem of art. His style bears so strong a resemblance to that of Ruysdael that many of his pieces pass under that artist's name.

HOBBES, THOMAS, was b. at Malmesbury, on April 5, 1588, and was the son of a clergyman of that town. At the age of 14 he went to Oxford, and was put through the usual course of Aristotelian logic and physics. His instructions in the syllogism

he afterwards held in very small estimation. At the age of 20, having taken his degree and quitted Oxford, he was recommended to lord Hardwicke, afterwards earl of Devonshire, as tutor to his eldest son, this being the commencement of an intimate connection with that great family which lasted through his long life.

In 1610 he went abroad with his pupil, and made the tour of France and Italy. After his return he still continued to live with the Devonshire family, and his residence in London afforded him opportunities of becoming acquainted with Bacon, Raleigh, Ben Jonson, and the other distinguished men of the time. Meantime he was occupied with his classical, political, and philosophical studies, and prepared for publication his first work, a translation of Thucydides, which came out in 1628, he having now attained the mature age of 40.

The earl of Devonshire having died in 1626, and the young earl, Hobbes's pupil, in 1628, he was plunged in great grief, and took the opportunity afforded him of going abroad with the son of sir Gervase Clifton, and remained some time in France. In 1631, however, his connection with the Devonshire family was resumed. By the desire of the dowager-countess, he undertook the education of the young earl, the son of the former pupil, then only 13. In 1634 he went to Paris, and on this occasion was much in the society of father Mersenne. He returned to England in 1637. He seems then to have applied himself to the composition of his first original work, entitled *Elementa Philosophica de Cive*, which was printed in Paris in 1642. This is the first exposition that he gave of his moral and political philosophy. His advocacy of pure and unrestrained monarchy as the best possible form of government, with an absolute submission on the part of the subjects both in law and in morality, and religion, to the will of the monarch, has probably given more general offense than any political theory ever propounded. It has been made the subject not merely of incessant attack, but of gross misrepresentation. He published soon after two small treatises, entitled *Human Nature*, and *De Corpore Politico*. The first contains his views as to the constitution of the mind, and entitles him to be considered as the father of modern systematic psychology. Although the work is valuable in itself, he still considers it as a prelude to the other treatise, *De Corpore Politico*, or on the nature of society, which is here handled for the second time by him, and in much the same strain. He goes over the whole ground a third time in the *Leviathan*, published in 1651 the fullest and perhaps the best known exposition of his views on mind, politics, morals, and religion. Here he contends as before in favor of pure monarchy, which he represents to have grown out of a primitive contract between the sovereign and the people, moved by the desire to escape from all the evils of a state of nature, which is a state of war. He is far from justifying tyranny; on the contrary, he enjoins upon the monarch a government according to just laws, and considers that this is more likely to be obtained by the government of a single person, whose selfish aims must be sooner satiated than if the supreme power were distributed in a number of hands.

After the meeting of the Long parliament in 1640, he had returned to Paris, from his dread of the civil troubles. In 1647 he was appointed mathematical tutor to the prince of Wales, afterwards Charles II., and stood high in the esteem of that prince; but the obnoxious character of his writings, especially after the publication of the *Leviathan*, so offended the royalist clergy, in common with all other sects, that Charles was induced to part with him; and he himself, being constitutionally timid, took the alarm for his personal safety, and abruptly fled from Paris to England. In England, he found himself safe, the Protestant government according him the most ample toleration. Very different was his position after the "glorious" restoration of his own friends; for although Charles granted him a pension of £100 a year, the dislike to his views was so general that they were condemned by parliament in 1666, and he was even in danger of still severer measures. His connection with the earl of Devonshire, with whom he lived in the latter part of his life, was no doubt a powerful protection to him. His old age was fruitful in additions to his writings, and was marked by some sharp controversies. His last works were a translation of Homer, and a history of the civil wars. He died on Sept. 4, 1679, in his 92d year.

HOBBY, *falco subbuteo*, a small species of falcon, a native of all or most parts of Europe and of many parts of Asia and Africa. It is in its utmost length, about 12 or 14 inches. It is grayish-black or bluish-gray on the upper parts, each feather edged with yellowish-white, and the whole form is very elegant. The hobby is occasionally seen in Britain, but is rare—rarer now than it seems to have been in former times It was often employed in falconry, and trained to fly at pigeons, and even at partridges.

HOBHOUSE, JOHN CAM. See BROUGHTON, lord.

HO'BOKEN, a city in New Jersey, U.S., on the w. bank of the Hudson river, opposite New York, with which it is connected by several steam-ferries. Its beautiful pleasure-grounds, the Elysian fields, formerly much resorted to by New-Yorkers, are now mostly sold for business purposes. There are heights which afford a fine view of the cities of New York and Brooklyn harbor, and fortifications.

HOBOKEN (*ante*), a city in Hudson co., N. J., on the Hudson river, opposite New York; pop. '70, 24,766; in '80, 30,999. It is substantially a section of Jersey city, and was for many years a rural district of great beauty, and one of the chief pleasure resorts

for citizens of the metropolis. In recent years it has been thickly peopled with Germans, and has quite lost its rural character. It is the landing place of several lines of European steamers, the terminus of a number of railroads, and has a great number of manufactories, including foundries, breweries, machine shops, iron works, etc. Among its institutions are St. Mary's hospital, the Martha institute, and the Stevens institute of technology. The latter was founded by E. A. Stevens, who presented a building site and a fund of $650,000. It has also an academy, a seminary for girls, and many excellent schools. The city (chartered in 1855) is lighted with gas, and furnished with water from the Passaic river. It was settled by the Dutch soon after their establishment in New Amsterdam (now New York).

HOCHE, LAZARE, one of the most eminent generals of the French republic, was b. June 25, 1768, at Montreuil, a faubourg of Versailles. In 1785 he entered the army, rapidly obtained promotion, and was raised, in 1793, to the command of the army of the Moselle. Here he was opposed to the duke of Brunswick, the commander of the Prussian army, and was by him repeatedly defeated. He was more successful against the Austrians, whom he drove out of Alsace. His next important service was putting an end to the civil war in La Vendée, which he accomplished in a prudent and patriotic manner. After having been sent, in the winter of 1796, as commander of the troops in the unfortunate expedition to Ireland, he was on his return appointed to the command of the army of the Sambre and Meuse. On April 18, 1797, he crossed the Rhine at Neuwied, and had defeated the Austrians in several battles, when his career was stopped by the armistice concluded between the archduke Charles and Bonaparte at Leoben. After the 18th Fructidor, he was suddenly taken ill in the camp at Wetzlar, and died Sept. 18, 1797.

HOCHELAGA, a co. in the province of Quebec, Canada, occupying 76 sq.m.; on the e. part of the island of Montreal; pop. 25,640. The capital is Longue Pointe.

HOCH'HEIM, a small t. of Prussia, in Hesse-Nassau, on the slopes of the right bank of the Main, 3 m. from Mainz. Several varieties of excellent wine produced here are known as *hochheimer;* hence the English name *hock,* now given indiscriminately to all wines from the Rhine regions.

HOCH'KIRCH, or HOCHKIRCHEN, a village in the district of Bautzen, in Saxony, was the scene of a battle between the Austrians and Prussians (Oct. 14, 1758) during the seven years' war. Frederick II. of Prussia, with an army 30,000 strong, having taken up an almost untenable position at Hochkirch, was attacked, under cover of a thick fog, by marshal Daun, with 50,000 Austrians, and compelled to retire to the heights of Dresa. Here he was again attacked by the duke of Aremberg, and after a conflict of five hours' duration, again retired. He lost 9,000 men killed and wounded, and 101 cannons. He himself and almost all his generals were wounded. The Austrians lost 8,000 men. On May 21, 1813, a battle took place here between the French and allies. See BAUTZEN,

HÖCHST, a t. in Hesse-Nassau on the Frankfort and Mentz railroad, 5 m. w. of Frankfort; pop. 4,055. The people are engaged in various manufactures. In June, 1622, Tilly won a battle here over duke Christian of Brunswick, and in 1795 the French were here defeated by the Austrians.

HOCH'STADT. See BLENHEIM.

HOCKING, a co. in s. Ohio on the Hocking river, intersected by the Columbus and Hocking valley railroad and a canal; 380 sq.m.; pop. '70, 17,925. It has a hilly surface and is partially covered with forests. There are iron and coal mines, but the chief productions are corn, wheat, oats, wool, and pork. Co. seat, Logan.

HOCKING, or HOCKHOCKING, a river in Ohio, near the middle of the state, running through a picturesque region and emptying into the Ohio. Boat navigation is possible for about 70 m., but beyond that distance are many falls and dams. The Hocking canal passes along one of the shores.

HODEIDA, or EL HUDAIDAH, a port in Arabia on the Red sea, 100 m. above Mocha, much visited by pilgrim ships from the east. The harbor is shallow, but there is considerable trade in coffee and India goods. It is the seat of the Turkish governor of Yemen.

HODGE, ARCHIBALD ALEXANDER, D.D., b. N. J., 1823; graduated and was a tutor at Princeton; in 1847 a missionary in India under the charge of the American board. He returned in 1850 and settled as pastor in Maryland, Virginia, and Pennsylvania. In 1846 he became professor of theology in the western theological seminary at Allegheny city, and in 1877 at Princeton. He is the author of *Outlines of Theology, The Atonement* and *Presbyterian Doctrine Briefly Told,* and other works.

HODGE, CHARLES, D.D., LL.D., an American theologian, was b. in Philadelphia, Dec. 28, 1797. He graduated at Princeton college in 1815, and in 1822 became a professor in the Princeton theological seminary, where he remained till the close of his life. He was founder and long the editor of the *Princeton Review;* and besides numerous essays, etc., he was the author of Commentaries on Romans, Corinthians, and Ephesians, on a work on the history of the Presbyterian church in America (1840), of a criti-

cism of Darwinism (1874), and of the well-known *Systematic Theology* (3 vols. 1872), now a standard work of the Calvinistic churches. He died June 19, 1878.—His son ARCHIBALD ALEXANDER is also favorably known as a theologian.

HODGEMAN, a new co. in w. Kansas on the Pawnee fork, a branch of the Arkansas. Organized after the census of 1870.

HODGES, WILLIAM, 1744–97, an artist who was with capt. Cook on his second voyage to the Pacific, and made the illustrations for Cook's narrative. He was afterwards in India under the patronage of Warren Hastings.

HODGKINSON, EATON, professor of the mechanics of engineering in University college, London, and the chief authority on the application of iron to architecture and engineering, was b. at Anderton, near Northwich, Cheshire, Feb. 26, 1789. At the age of 21, he settled in Manchester. At this time the principal authority on iron beams was Tredgold (q.v.), but his theories were overturned by Hodgkinson. Hodgkinson next made a series of 227 experiments on the strength of pillars, generally in conjunction with sir William Fairbairn (q.v.). For his important experiments and calculations, and general co-operation in the construction of the Britannia bridge, he received a first-class medal at Paris in 1855. His investigations are in general scattered through the *Transactions* of the British association, and the memoirs of the Manchester society. He also edited *Tredgold on the Strength of Cast Iron*, adding his own theories (1842–46). Hodgkinson died in June, 1861, near Manchester. See STRENGTH OF MATERIALS, and TUBULAR BRIDGES.

HODGSON, JOHN EVAN, b. London, 1831; educated at Rugby, and in 1853 became a student of art at the royal academy. His first picture was exhibited in 1856, since which time he has been a regular exhibitor. He first painted domestic and contemporaneous subjects, but afterwards excelled in historical pictures from 1861 till 1869, when his visit to n. Africa interested him in subjects of Moorish life, to which he has since chiefly confined himself. His principal pictures are—"Arrest of a Poacher," "Canvassing for a Vote," "Sir Thomas More's Daughter in Holbein's Studio," "A Rehearsal of Music in a Farm-house," "Return of Sir Francis Drake from Cadiz," "First Sight of the Armada," "Queen Elizabeth at Purfleet," "Taking Home the Bride," "Jewess Accused of Witchcraft," "Chinese Ladies and European Curiosities," "Roman Trireme at Sea," "Arab Story-Teller," "Arab Prisoners," "The Pasha's Black Guards," "The Outpost," "An Arab Patriarch," "Army Reorganization in Morocco," "The Snake Charmer," "A Fair Customer," "Jack Ashore," "A Tunisian Bird-seller," "A Needy Knife-grinder," "Returning the Salute," "Odd Fish," "A Barber Shop in Tunis," "The Talisman," "The Temple of Diana at Zaghouan," "Better have a New Pair," "Following the Plough," "Commercial Activity in the East," "Pampered Menials," "Relatives in Bond," "An Eastern Question," "Lost," and "The Pasha."

HODOMETER is an instrument for measuring the distance traveled over by any conveyance, and consists of an arrangement of toothed wheels, like clock-work, fixed on one side of a machine, and connected with the axle, from which motion is communicated to it. An index and dial show the exact distance the vehicle has traveled.

HOE, an implement of gardening and of agriculture used for stirring the soil, drawing up earth to plants, thinning plants in drills, clearing the ground of weeds, etc. There are many forms of this implement, all of which may be referred to two classes—*draw-hoes* and *thrust-hoes*, the former having the blade almost at right angles to the handle; the latter almost in the same plane with it. The thrust-hoe, or *Dutch hoe*, is chiefly used for killing weeds, and for stirring ground to a very slight depth. The draw-hoe, although much used as an implement of gardening, is scarcely used in Britain as an agricultural implement, except for the thinning (*singling*) of turnips, in which it is always employed. But in some countries it is very extensively used in place of the spade. In some parts of the West Indies almost all the tillage of the ground is done by the hoe. It is more adapted than the spade to the use of laborers whose feet are not provided with shoes. Hoes intended for tilling the ground, instead of the plow and spade, are much larger and heavier than those used in British gardening, and are raised much higher, and brought down to the ground with greater force, somewhat like the pickaxe. Hoes for stirring very stiff soils are sometimes made with prongs instead of a blade.

In the improved agriculture of the present day, implements called *horse-hoes* are extensively used. They are intended for purposes corresponding with those of the thrust-hoe, and may be generally described as consisting of thrust-hoe blades, variously modified, and attached to a frame in order to be drawn by a horse. Various contrivances are employed to accommodate the blades to inequalities of surface, etc. Horse-hoes can only be employed for crops sown in drills: and the drills must be perfectly parallel, if more than one interval is to be cleaned and stirred at once. With the sowing machines now in use, however, this is secured. In turnip-husbandry, a horse-hoe with several blades is often used to clear away the weeds from one interval.

HOE, RICHARD MARCH, b. New York, 1812; the son of an English inventor. He is known all over the world for his many valuable improvements in printing presses, of which he is the leading manufacturer. He went to England in 1837 to patent an improvement in the manufacture of saws, and his visit enabled him to perfect improve-

ments in printing machinery, which were adopted largely in England as well as in America. In 1846 he invented the "lightning press," named from the wonderful rapidity of its work.

HOEI-SHIN, or HUI-SHÊN, a Buddhist monk of China supposed to have lived about the close of the 5th C. A.D., and to have traveled in foreign lands, which might be western North and South America. He said that iron was not to be found in these countries; that gold was not esteemed, and was of no value in commerce. He also asserts that he found Buddhist institutions already established.

HOE'S MACHINE. See PRINTING.

HOEVEN, JAN VAN DER, a distinguished Dutch naturalist. He was b. in 1801 at Rotterdam, and after studying medicine at Leyden, established himself as a physician in his native town, where he remained till 1835, when he was elected to the professorship of zoology in the university of Leyden, an office which he held till his death in 1868. His most important work is his *Handboek der Dierkunde* (Leyden, 1827–33), of which a second edition, entirely recast, appeared in 1846; a German translation was published in 1848; and an English translation, by prof. Clark of Cambridge, under the title *Handbook of Zoology*, was issued, with important additions, both by the author and the editor, in 1856–58. The fact that most of his works are memoirs, and written in Dutch, is a great check to their general perusal by English and French naturalists.

JAN must not be confounded with his brother, CORNELIUS PRUYS VAN DER HOEVEN, professor of medicine in the university of Leyden, and the author of several important works, amongst which may be especially mentioned *De Historia Medicinæ* (Leyden, 1842) and *De Historia Morborum* (Leyden, 1846).

HOF, a manufacturing t. of the kingdom of Bavaria, in upper Franconia, is situated in a fruitful district on the Saale, 32 m. n.e. of Bayreuth. Besides extensive manufactures of leather, and linen and woolen fabrics, an important transit trade, arising from its position on the frontiers of Bavaria, and on the railway connecting that country with Saxony, is here carried on. Iron and coal mines are worked in the vicinity. Pop. '75, 18,267.

HOFER, ANDREAS, the patriotic leader of the Tyrolese, was b. at St. Leonard, in the valley of Passeyr, Nov. 22, 1767. In 1796 he led a body of Tyrolese against the French on the lake of Garda; in 1808 secret deputies, among whom was Hofer, arrived at Vienna, to represent to the archduke John the sufferings of the people, and their wish to be reunited to Austria. By the desire of the archduke, baron von Hormayr sketched for them a plan of an insurrection, which met with such success that, in three days, from the 11th to the 13th of April, 1809, nearly the whole country was liberated. Napoleon, however, was victorious in Austria, and at once marched three armies to the Tyrol, to subdue the rebellious peasantry, who had been abandoned by the Austrians, in accordance with the armistice of Znaim (July 12, 1809). At first, Hofer concealed himself in a cave in the valley of Passeyr; but when Spechbacher, Joachim Haspinger, a Capuchin, and Peter Mayer, at the head of the armed population, renewed the defense of the Tyrol, and repeatedly defeated the enemy, Hofer issued from his retreat, and took the leadership of the Tyrolese. At the battle fought on Aug. 12 on the Iselberg, Lefèbvre was driven from the Tyrol. Hofer continued to conduct the civil and military administration till the peace of Vienna (Oct. 14). The French and Bavarians poured, for the third or fourth time, into the country, and after a brief struggle Hofer was obliged to take refuge in concealment. After a lapse of two months, he was betrayed into the hands of the French by a priest named Donay, conveyed to Mantua, tried, and condemned to be shot. The sentence was carried into execution on Feb. 20, 1810. His family were indemnified for the loss of their property by the emperor of Austria in 1819, and his son ennobled. A statue of Hofer, executed by Schaller, was erected in 1834 in the church of the Franciscans, at Innsbrück, near the tomb of the emperor Maximilian I.

HOFFMAN, CHARLES FENNO, b. New York, 1806; educated at Columbia college, at the age of 21 admitted to the bar, and about the same time became a writer for newspapers. When the *Knickerbocker Magazine* was started he was for a few months the editor. In 1835 he published *A Winter in the West*, and two years later *Wild Scenes in the Forest and the Prairie*. In 1840 he published *Greyslaer*, a novel. But his fame rests chiefly upon his poems. Thirty years ago he became afflicted with mental disease, and has since lived in an asylum.

HOFFMAN, DAVID, LL.D, 1784–1854; b. Md.; in 1817 professor of law in the university of Maryland. After 1836 he traveled for a time in Europe, and sent a number of articles relating to the United States to a London paper. He published *A Course of Legal Study; Legal Outlines; Viator; Chronicles selected from the originals of Cartaphilus, the Wandering Jew;* and *Miscellaneous Essays.*

HOFFMAN, MURRAY, 1791–1878; b. New York; graduated at Columbia college, and became one of the foremost of lawyers. In 1839 he was assistant chancellor, and in 1853 judge of the supreme court. His legal publications are numerous and valuable. Among them are *Office and Duties of Master in Chancery; Vice Chancery Reports;* and three books on ecclesiastical law and custom.

HOFFMAN, OGDEN, 1799–1856; b. New York; graduated at Columbia college; served in the second war with England as a midshipman; was admitted to the bar, and made a great reputation as a lawyer in New York. In 1837, and again in 1848, he was elected a member of congress, and in 1854 was attorney-general of New York state.

HOFFMAN, WILLIAM, b. New York, 1807; a graduate of West Point; served in the Black Hawk and Florida Indian wars, and in the war with Mexico. In the war with the rebellion he was commissary gen. of provisions. In 1870 he was retired from service with the rank of col. and brevet rank of maj.gen.

HOFFMANN, AUG. HEINRICH, commonly called HOFFMANN VON FALLERSLEBEN, a distinguished German poet and philologist, was born April 2, 1798, at Fallersleben, in the district of Luneburg, He went in 1816 to the university of Göttingen, which in 1819 he left for Bonn. He soon gave up theology, which his father had destined him to, and occupied himself exclusively with philological and literary studies, which, from his first acquaintance with the brothers Grimm (1818), turned more and more to his native language and literature. After traveling through the Rhine countries and Holland in search of popular poetry, and living for some time in Berlin, he was made keeper of the university library of Breslau in 1823, extraordinary professor of the university there in 1830, and ordinary professor of the German language and literature in 1835. The publication of his *Unpolitische Lieder* (Unpolitical Lays) led to his being deprived of his office, Dec. 20, 1842. For some years afterwards Hoffman, thrown entirely upon literary work for his support, led a wandering life through the whole of Germany, Switzerland, and Italy, the subject of laudation on the one hand, or of vituperation on the other, and at times kept under the surveillance of the police. In 1845 he was naturalized in Mecklenburg. Restored to his rights in Prussia, 1848, he drew from that time his statutory salary as a pension, He married in 1849, settling on the Rhine, and in 1854 he went to Weimar. In 1860 he became librarian to the duke of Ratibor, at the castle of Korvei, on the Weser, where he died in 1874. His principal philological and antiquarian works are: *Horæ Belgicæ* (1830–37), *Reineke Vos* (1834), *Geschichte des Deutschen Kirchenlieds* (1832), collections of ancient German political (1843) and social (1844) songs, *Spenden zur Deutschen Literaturgeschichte* (1845), and *Die Deutsche Philologie* (1836). Hoffmann's own poetry has a close alliance to popular song, and hits the tone of genuine simplicity, tenderness and pathos to a degree that scarcely any other poet of recent times has succeeded in doing. He also produced many admirable tunes for his songs. The *Gedichte* appeared in 1834 (8th ed. 1874), and he published numerous collections of songs, as *Allemannische Lieder, Soldatenlieder, Kinderlieder*, etc. He wrote an autobiography in 6 vols. (*Mein Leben*, 1862–70).—See Wagner's *H. von Fallersleben* (1869), and Gottschall, *Porträts* (1876).

HOFFMANN, ERNEST THEOD. AMADEUS, properly WILHELM, one of the most original German story-tellers, was born Jan. 24, 1776, at Königsberg in Prussia. He studied law there, and then found employment in the government offices at Grossglogau and in Berlin. In 1800 he became assessor to the government of Posen; but in consequence of some able caricatures of his, which gen. Zastrow and others in high positions applied to themselves, he was removed in 1802, as councilor to Plock, and in 1803, in the same capacity to Warsaw, where the entrance of the French ended his career. Without prospects of fortune, he made use of his knowledge of music as a means of livelihood, and, though sometimes reduced to great straits, managed to support himself by giving music lessons, and by contributing to the *Musical Gazette* of Leipsic. In 1813 he went to Dresden as music director to a company of players alternating between Dresden and Leipsic, and continued to conduct the orchestra of the company till 1815. In 1816 he was again appointed by Prussia to be councilor in the royal supreme court of judicature at Berlin, where, before long, he was seized with a disease in his back, the consequence of his irregular life, and after much suffering, died July 24, 1822. From his youth he had devoted all his leisure hours to the study of music. The *Phantasiestücke in Callot's Manier, Elixire des Teufels, Nachtstücke, Die Serapionsbrüder Lebensansichten des Kater Murr, Der Doppelgänger*, and a few shorter stories, all appeared between 1814 and 1824. Hoffmann was a man of thorough originality, and yet an excellent man of business, and lawyer. He had a keen understanding, but was full of fantastic ideas, and a believer in demons. His character was made up of incongruities; and between like contradictory extremes his novels range. His fame rests mainly on his novelettes, which are masterpieces in miniature, such as *Das Majorat, Fräulein Scudéry Doge u. Dogaresse.* Hoffmann's talents were wonderfully various; he not only distinguished himself as a poet and composer, but as a caricaturist. He handled language in a masterly way, although not free from mannerism. A collection of his choice works appeared in 1828 (10 vols.), and one of his collected works in 1857 (12 vols.). See Hitzig, *Aus Hoffmann's Leben und Nachlass* (1823). In foreign countries, particularly in France, Hoffmann has been repeatedly translated and imitated.

HOFFMANN, FRIEDRICH, one of the most celebrated physicians of the last century, was born at Halle in 1660, and died in that city in 1742. At the age of 15 he lost his parents, who died from typhus fever, and very shortly afterwards became deprived by a fire of the small patrimony that devolved to him. Undismayed, however, by these

misfortunes, he repaired in 1678 to Jena, to study medicine, and from thence proceeded to Erfurt, to become a pupil of the distinguished chemist Gaspard Cramer. He commenced practice at Minden in Westphalia, where he had influential connections, and where, in a very short time he acquired a high reputation. After a residence of little more than two years in Minden, during which time he visited Holland and England, he removed to Halberstadt. In 1693 Frederick, elector of Brandenburg, afterwards king of Prussia, appointed Hoffmann to the professorship of medicine in the newly constituted university of Halle. It was on his recommendation that the celebrated Stahl (q.v.), who had been his fellow-student at Jena, and subsequently became his great rival, was appointed one of his colleagues. At the urgent request of the king, he subsequently removed to Berlin, where he remained for three years; but finding that he could not pursue his studies in the atmosphere of the court, he returned to Halle; and although he subsequently attended the king at Berlin during a long illness, Halle was his residence during the remainder of his life. As a physician and a medical teacher, Hoffmann enjoyed a celebrity second only to Boerhaave, who contemporaneously occupied the chair of medicine at Leyden. It is unnecessary here to enter into his special doctrines, which are now of little practical value. Haller asserts that he amassed a large fortune by the sale of secret remedies, one of which is still designated Hoffmann's Anodyne Liquor (q.v.). Of his numerous works, the greatest is his *Medicina Rationalis Systematica* (Halle, 1718–40, 9 vols, 4to), which occupied him for more than twenty years, and was concluded in his eightieth year. His complete works have gone through various editions. His *Opera Omnia Physico-medica Denuo Revisa, Correcta et Aucta,* were printed at Geneva in 1640, in six folio volumes, and were reprinted after his death with five supplementary volumes of previously unpublished *Opuscula.* These were reprinted at Venice in 1745, in 17 volumes 4to, and twice subsequently at Naples on a still larger scale.

HOFFMAN'S ANODYNE LIQUOR, is the old name for the *Compound Spirit of Sulphuric Ether* of the London pharmacopœia, and is a mixture of ether, alcohol, and ethereal oil. It is often prescribed with laudanum, in order to prevent the nausea which the opium preparations frequently excite, and may be given in water, unassociated with anything else, as a stimulant and antispasmodic, in doses varying from half a dram to two drams.

HOFFMANNSEGG, JOHANN CENTURIUS, 1766–1849; b. Dresden; studied at Leipsic and Göttingen, and became celebrated as a botanist. He discovered and described a great number of new plants, and made valuable contributions to entomology.

HOFHOF, or EL-HOFHOF, the capital of the province of Lahsa Arabia, near the Persian gulf. Pop. 24,000. The fortifications once formidable are now in ruins. There are mosques and inclosed gardens, and all the features of an eastern town.

HOFLAND, BARBARA, 1770–1844; b. England, the daughter of a manufacturer. She published a volume of verses in 1805, and three years later married Hofland, the artist (her second husband). She published over 70 separate works, of which the larger portion were for young people. Some of the more notable were *The Daughter-in-Law, The Czarina, The Clergyman's Widow,* and *The Son of a Genius.*

HÖFLER, KARL ADOLPH KONSTANTIN, b. Bavaria, 1811; graduated at Munich, and studied in Italy. In 1836 he was the editor of the official gazette at Munich, and in 1840 professor in the university. In 1841 he was professor of history at Prague. He has written a number of works on political and historical subjects.

HOFMANN, AUGUST WILHELM, F.R.S., a distinguished living chemist, b. at Giessen in 1818. After obtaining the degree of doctor of philosophy, he became assistant to Liebig, in the Giessen laboratory, and subsequently he was appointed extraordinary professor of chemistry in the university of Bonn. When the royal college of chemistry was established in London in 1845, Hofmann was recommended by Liebig as highly qualified for the important post of superintendent to the new institution. This college, which has since merged into the laboratory of the royal school of mines, owes much of its high character to his teaching and his scientific reputation. On the elevation of prof. Graham from the post of chemist to the mint to the office of master of that institution, Hofmann was appointed his successor. In 1865 Hofmann accepted an appointment to be professor of chemistry in the university of Berlin, with the commission to found a chemical institute. He was a juror at all the international exhibitions (London, 1851 and 1862; Paris, 1865 and 1867). In conjunction with Dr. Bence Jones he edited the later editions of Fownes's *Manual of Chemistry.* His numerous contributions to the *Annalen der Chemie und Pharmacie,* to the *Transactions of the Chemical Society,* and to the *Philosophical Transactions of the Royal Society,* are for the most part on the very highest departments of organic chemistry; and in 1854 a royal medal was awarded to him for his *Memoirs on the Molecular Constitution of the Organic Bases.* It was in the course of these researches that he discovered in coal-naphtha aniline, the basis of the new colors mauve and magenta which had previously been only obtained from indigo. For his practical applications of this discovery, one of the great prizes was awarded to him at the Paris exhibition of 1867. Hofmann's *Introduction to Modern Chemistry* (1865; 5th ed., 1871) has led to great reforms in the teaching of chemistry.

HOF'WYL, a village of Switzerland, in the canton of Bern, and situated 6 m. n. of the town of that name. It has been long famous as the seat of the educational and agricultural institution founded here by the late M. Fellenberg (q.v.). Not many years after the death of M. Fellenberg, the institution was given up.

HOG, *Sus*, a genus of pachydermatous quadrupeds, of the family *suidæ* (q.v.). The neck is carried straight forward from the trunk, and is very thick and strong. The skin is very thick, and mostly covered with stiff bristles, among which a short curled hair is often also found. The bristles of the back of the neck generally become a mane in wild hogs, and particularly in the males, although, in domestication, this tends to disappear. The muzzle is elongated, and terminated by a movable cartilaginous disk, furnished, as in the mole, with a special small bone, and used, along with the tusks, as an implement for turning up the soil in search of roots and other food. There are 6 incisors, 2 canine teeth, and 14 molars in each jaw, the lower incisors projecting forwards; the canine teeth long and strong, projecting and curved, becoming formidable tusks in wild boars, and large and powerful even in the females in a wild state. The feet have each four toes, the lateral ones small, and scarcely touching the ground, all separately hoofed. The tail is short. The stomach shows mere traces of division. The food is chiefly vegetable, but perhaps no animals may more properly be called omnivorous; and although, even in a wild state, hogs are not to be reckoned among beasts of prey, they not unfrequently, even in domestication, kill and eat small animals that come in their way, as many a housewife has had occasion to observe in respect to chickens.—The common hog (*S. scrofa*) appears to be a native of most parts of Europe and Asia, and domesticated swine were found by the first navigators in many of the islands of the southern seas. The wild boar is still found in the forests of many parts of Europe, and was at one time an inhabitant of those of Britain, where it was protected by game-laws in the 10th and 11th centuries; but at what time it ceased to exist as a wild animal in Britain is uncertain. The adult males, in a wild state, are generally solitary; the females and young gregarious; and when assailed by wolves or other beasts of prey, wild swine defend themselves vigorously, the stronger animals placing themselves in the front, and the weaker seeking shelter in the rear. The chase of the wild boar is one of the most exciting sports of Europe or of India, particularly when carried on without the rifle, and on horseback with the spear ("pig-sticking"). The speed of the animal is very considerable, and the chase sometimes extends to 6 or 7 miles. Although the use of its flesh was prohibited to the Jews, and the prohibition has been adopted in the Mohammedan law, the hog has been a domesticated animal from a very early period, and its flesh constitutes a large part of the food of many nations. The fecundity of the hog is great; with proper treatment, it will produce two litters annually, generally of 4 to 8 pigs each, although sometimes there are as many as 14 in a litter. Vast quantities of the flesh are consumed in various forms in the British islands and North America, as pork, fresh or salted, bacon, ham, etc. Brawn (q.v.) is an esteemed English luxury. The fat of the hog, which is produced in a thick layer under the skin, is an article of commerce, and of various use under the name of Lard (q.v.). The skin of the hog is made into leather, which is particularly esteemed for saddles. The bristles, particularly of the wild boar, are much used for brush-making.

There are numerous varieties of the domestic hog, of which some have erect, and some pendant ears; and those are most esteemed which exhibit the greatest departure from the wild type, in shorter and less powerful limbs, less muscular and more rounded forms, etc. The *Chinese* breed and the *Neapolitan* have been of great use in the crossing and improving of the breeds commonly reared in Britain, giving rise to the improved white and black breeds respectively. Hogs are profitably kept wherever there is much vegetable refuse on which to feed them, as by cottagers having gardens, farmers, millers, brewers, etc. They are often allowed to roam over fallow ground, which they grub up for roots, and over stubble-fields, which they glean very thoroughly. They are also fed in woods—an ancient practice—where they consume acorns, beechmast, and the like. When they are fed, as is sometimes the case, chiefly on animal garbage, their flesh is less palatable and less wholesome.

The hog has a reputation which it does not deserve, of peculiar filthiness of habits. It is true that it wallows in the mire, as the other *pachydermata* also do, to cool itself and to provide itself with a protection against insects, and it searches for food in any puddle; but its sleeping-place is, if possible, kept scrupulously clean. The too common filthiness of pigsties is rather the fault of their owners than of their occupants; and a clean and dry sleeping-place is of great importance to the profitable keeping of hogs.

The hog is not inferior to other quadrupeds generally in intelligence. It can be easily rendered very tame and familiar. Its acuteness of scent has been turned to account in making it search for truffles; and an instance is on record of a pig having been used as a pointer, in which service it learned to acquit itself extremely well. Instances have occurred of the use of the hog as a beast of draught.

The forests of the island of Papua or New Guinea produce a species or variety of hog (*S. papuensis*), more widely different from the common hog than its breeds are from one another. It is 18 or 20 in. high, with short ears, and very short tail. The color is mostly brown. The Papuans have not properly domesticated this animal, although they often

trap the young ones and keep them till ready to be killed for use. The flesh is very delicate.

The babyroussa (q.v.) is another and very remarkable species of hog.

The *bosch vark*, or bush hog of South Africa (*choiropotamus Africanus*), is about 2 ft. 6 in. high, covered with long bristles; it has projecting tusks, a large callous protuberance on each cheek, and long sharp tufted ears. It is gregarious, subsists chiefly on vegetable food, and makes destructive inroads on cultivated fields.

HOGAN, JOHN, 1800–58; b. Ireland; studied sculpture in Rome, and received high praise from Thorwaldsen for his "Drunken Faun." He received a medal at the Paris exhibition of 1851.

HOGARTH, WILLIAM, a celebrated painter and engraver, born in London in the year 1697, served his apprenticeship to a silversmith in Cranbourne street, named Ellis Gamble, and next studied for some time under sir James Thornhill, the historical painter, but not with any marked success. About 1720 he set up for himself, and his first employment was to engrave coats of arms, crests, shop-bills, etc., after which he undertook to execute plates for booksellers, the chief of which are the prints illustrative of *Hudibras* (Lond. 1726). He now tried his hand at portrait-painting, and soon had ample employment, though he never cared anything for this branch of art. In 1730 he married (clandestinely) a daughter of sir James Thornhill, and soon after began to display his extraordinary talent for representing in pictures the follies and vices of his time. In 1733 appeared his "Harlot's Progress," a series of six pictures, which, like his other works, were engraved by himself. It was these engravings, and not the original paintings, that made Hogarth a rich man, and enabled him to keep his carriage at the age of 48. The "Harlot's Progress" was followed by other moral histories and satirical representations of vice and folly, such as "The Rake's Progress," published in eight engravings; "Southwark Fair;" "A Modern Midnight Conversation;" "The Distressed Poet;" and "Strolling Actresses in a Barn." The success of these was great, and inspired Hogarth with the belief that he could also win a reputation as an historical painter. After several ineffectual attempts, he recovered from his delusion, and returned to the path which nature had appointed him. In 1741 he published "The Enraged Musician;" in 1745, "Marriage à la Mode," in a series of six engravings, the pictures for which were purchased for the national gallery; and in 1748, "The March to Finchley. In 1753 he published his *Analysis of Beauty*, a work which excited much opposition and ridicule, and Hogarth is generally held to be erroneous in the conclusions at which he arrives. In 1755 appeared "Four Prints of an Election;" and in 1762, "The Times," a cutting satire upon Pitt. He died in 1764, and was buried at Chiswick, where a handsome monument was erected to his memory, with an inscription by his friend Garrick. In the technical part of his art, Hogarth was long thought not to have excelled, but modern opinion is more favorable in this respect. There has never, however, been any but one opinion regarding the greatness of his thought and invention, and his deep insight into the characteristics of his time and country. The moral of his satire is always stern, true, and unmistakable. A handsome edition of his works from the original plates, retouched by Heath, was published by Nichols (3 vols. Lond. 1820–22); others appeared at Leipsic (1831–35; 3d edit. 1841), and at Stuttgart (1839–40)

HOGG, JAMES, a Scottish poet, was born in the district known as the forest of Ettrick, in Selkirkshire, in 1772, and was at school for two or three winters before he reached the age of eight. At that early age he entered upon the occupation of shepherd. His first song appeared anonymously in 1801, and having gone shortly after to sell his employer's sheep in Edinburgh, he threw off 1000 copies of verses which he had written. In the same summer, Scott visited the Ettrick forest in search of materials for his *Border Minstrelsy*, when Hogg made his acquaintance, and placed in his possession a number of ballads, taken down from the recitation of persons resident in the district, which appeared in the third volume of the *Minstrelsy*, in 1803. In the same year, he published *The Mountain Bard*, the proceeds of which, together with two prizes for essays he received from the Highland society, amounted to £300. With this sum he took a farm, which proved a disastrous speculation. In 1810 he began a course of regular authorship. In 1813 his poem *The Queen's Wake* appeared. In 1814 he married; and although he afterwards went to live on a farm given to him by the duke of Buccleuch, he busied himself more with books and booksellers than with sheep and grazing. His pen was profitable, which was more than he could bring his farm to be. He died at Altrive, on Nov. 21, 1835. His works are numerous, comprising, in addition to those already mentioned, *Madoc of the Moor; The Pilgrims of the Sun; The Jacobite Relics of Scotland; Queen Hynde; The Border Garland;* and some songs of great beauty. He also wrote extensively in prose. His prose works are—*The Brownie of Bodsbeck; Winter Evening Tales; The Three Perils of Man; The Three Perils of Woman; The Altrive Tales;* a volume of *Lay Sermons*, and a *Life of Sir Walter Scott.*

After Burns, Hogg is unquestionably the greatest peasant-poet which Scotland has produced. His finest work, both in conception and finish, is *The Queen's Wake.* The general flow of the poem is lively and harmonious, while in one portion, that of "Kilmeny," the reader seems to hear "the horns of Elfland faintly blowing;" and in another, "The Witch of Fife," he is introduced into the weirdest, witch, and wizard world. His

prose works are very unequal, but they occasionally display great humor, and always abound in graphic description.

HOG-GUM, the name given in the West Indies to a resinous substance, which is there extensively used as a substitute for pitch, to tar boats and ropes, also for strengthening-plasters, etc., and internally as a diuretic, laxative, and stimulant medicine. It is still disputed what tree produces the true hog-gum; some ascribing it to *moronobea coccinea*, of the natural order *guttiferæ;* some to *rhus metopium*, a species of sumach, of the order *anacardiaceæ;* and some to *helwigia balsamifera*, of the order *amyridaceæ*. The probability seems to be that all these—and perhaps other—trees yield resinous substances of very similar quality, and commonly designated by the same name.

HOGMA'NAY, or HAGMENA, a word of doubtful derivation, applied in the n. of England and lowlands of Scotland to new year's eve. See NEW YEAR. It was customary for persons to go, on "hogmanay night," from door to door, asking in rude rhymes for cakes and cheese (and sometimes for money), on receiving which they passed on to the next house. This custom is rapidly dying out.

HOG PLUM, SPANISH PLUM, and BRAZILIAN PLUM, names given in the West Indies and other tropical countries to the fruit of certain species of *spondias*. The genus *spondias* belongs to the natural order *anacardiaceæ*, or, according to some botanists, to a small order called *spondiaceæ*, differing from *anacardiaceæ* in the want of a resinous juice, and in the drupe having a nut with 2 to 5 cells and seeds, instead of one cell and one seed. The species of *spondias* are trees and shrubs with pinnate leaves, which have a terminal leaflet, and flowers in racemes or panicles. Some of them produce very pleasant fruits, among which may be reckoned *S. purpurea* and *S. lutea;* the species generally called hog plum in the West Indies, because they are a common food of hogs, which revel in their abundance. *S. purpurea* has fruit about an inch in length, ovate or oblong, purple or variegated with yellow; the pulp yellow, with a peculiar but agreeable acid and aromatic taste. The fruit of *S. tuberosa*, called Imbuzeiro in the n. of Brazil, is about twice the size of a large gooseberry, oblong, yellowish, with a leathery skin and sweetish acid pulp. A much-esteemed Brazilian dish is prepared of milk, curds, sugar, and the pulp of this fruit, from which also a refreshing beverage is made for use in fevers. The tree is remarkable for the numerous round black tubers—about 8 in. in diameter—which it produces on its widely spreading roots, and which are very cellular, and full of water. They are evidently intended for the wants of the tree in the dry season, and are often dug out by travelers for the sake of the water, of which each tuber yields about a pint. Closely allied to *spondias* is the genus *poupartia*, to which belongs the Vi or Tahiti Apple, formerly *spondias dulcis*, a very fine fruit of the South sea islands.

HOG RAT, or HUTIA, *Capromys*, a genus of quadrupeds, of the family *muridæ*, differing from rats in having four grinders on each side in each jaw, with flat crowns. The tail is round and slightly hairy, and is used for support in sitting erect, as by kangaroos, and for aid in climbing trees, in which these animals are very expert. They make much use of their fore-paws, as of hands. Their food is entirely vegetable. They are natives of Cuba, where they are found in large numbers in the woods. They were much used as food by the aborigines. The best known species is of the size of a small rabbit.

HOGSHEAD, an old English measure of capacity. For wine, it was equivalent to 63 gallons; for ale and beer, to 54 gallons. In the United States, it is still used as a measure for liquids, equivalent to 63 gallons; but when used for tobacco, it varies in different states from about 750 to 1200 lbs.

HOGUE, CAPE LA. See CAPE LA HOGUE.

HOHENLINDEN, a village in Upper Saxony, with 250 inhabitants, famous for the victory gained there by Moreau over the archduke John, Dec. 3, 1800. After the expiration of the armistice concluded at Paersdorf, on Nov. 13, Moreau's army took up a position on the plateau between the Isar and the Inn, and the Austrian army, under the archduke John, on the right bank of the Inn. The Austrian main body advanced amidst drifting snow, and attacked the divisions of Grénier and Grouchy with the utmost fury; but the French receiving considerable reinforcements under Ney, the assailants were driven back; and being attacked in the rear, were totally routed. The victory was likewise decided at other points in favor of the French, who were only prevented from pursuit by inclement weather, bad roads, and the short winter day. The Austrians had 8,000 men killed and wounded, 11,000 made prisoners, including 180 officers, and 100 pieces of artillery. The French had 5,000 men killed and wounded. In consequence of this battle, the negotiations between the belligerent powers were resumed, and shortly after ended in the peace of Lunéville.

HOHENLOHE, an ancient German principality, in Franconia, now comprised chiefly in Würtemburg, partly also in Bavaria.

HOHENLOHE, a princely family of Germany, formerly in possession of the Hohenlohe principality, which was mediatized 1806. The ancestry of this noble house dates back to the early dukes of Franconia, and it was at first divided into two branches, the Hohenlohe-Hohenlohe, and the Hohenlohe-Speckfeld; but the former was soon

extinct, the last descendant dying in the fourth generation. Of the descendants of the Hohenlohe-Speckfeld branch, Georg, reigning duke in 1551, left two sons, who founded respectively the families of—I. Hohenlohe-Neuenstein-Oehringen, which died out in 1805, and of Hohenlohe-Neuenstein-Langenburg, now subdivided into Hohenlohe-Oehringen, and Hohenlohe-Langenburg; II. The branch of Hohenlohe-Waldenburg, since divided into Hohenlohe-Bartenstein, and Hohenlohe-Schillingsfurst. Of the elder branches, FREDERICK LUDWIG, prince of Hohenlohe Ingelfingen (1746–1818), distinguished himself at the battle of Weissenberg, and gained the victory at Kaiserlauten; but after the defeat of Jena, 1806, he retired from active participation in the campaign. Of the younger branches, ALEXANDER LEOPOLD FRANZ EMMERICH, descendant of the Hohenlohe-Waldenburg-Schillingsfurst family, is the best known (1794–1849). He was in priestly orders, and during the terrible epidemic fevers at Stuttgart, he devoted himself to the sick, and did much by his eloquence, both there and in Munich, to revive religious feeling. Miraculous cures were attributed to him, one of his first patients being the princess Schwarzenberg, a paralytic. His fame was increased by his sudden cure of an American lady, Mrs. Mattingley, at Washington, 1824. He published many controversial works, but did not succeed in obtaining the papal sanction for his treatment of disease. Another descendant of the same branch is the Bavarian statesman, KARL VICTOR, born 1819, one of Bismarck's firmest adherents, a member of the reichstag, and in 1871 its vice-president. He was a strong advocate of German unity, and although he was one of the first to introduce the Prussian military system into Bavaria, he favored the South German confederation. The present representatives of the family are, for the *Neuenstein branch:*

I. HOHENLOHE-LANGENBURG, Prince Hermann-Ernest-François-Bernard; married princess Leopoldina of Baden.

II. HOHENLOHE-OEHRINGEN, Prince Frederic-William-Eugene-Charles, duke of Ujest; married princess Pauline of Ujest.

III. HOHENLOHE-INGELFINGEN, Prince Charles-Adalbert-Constantine-Henry, lord of Klein Dronlowitz; born 1820.

IV. HOHENLOHE-KIRCHBERG, Princess Maria, countess of Urach.

For the *Waldenburg branch:*

I. HOHENLOHE-BARTENSTEIN, Prince John-Frederick-Michel-Charles-Marie.

II. HOHENLOHE-BARTENSTEIN-JAGSTBERG, Prince Albert-Vincent-Ernest-Leopold.

For the *Hohenlohe-Waldenburg-Schillingsfurst branch:* Prince Frederick-Charles; married princess Therèse of Hohenlohe-Waldenburg-Schillingsfurst.

HOHENSTAUFEN, a German princely house, which kept possession of the imperial throne from 1138 to 1254. The founder of the family was FREDERICK VON BÜREN, who lived about the middle of the 11th c., and assumed the name of Hohenstaufen from a castle of that name, the ruins of which are still to be seen on the summit of the Hohenstaufen berg (2,240 ft.), a hill on the left bank of the Danube, about 30 m. below Stuttgart. A son of his was the chevalier Frederick von Staufen, lord of Hohenstaufen, who steadfastly supported the emperor Henry IV., and in return received the duchy of Swabia. Duke Frederick, at his death in 1105, left two sons—Frederick II., the one-eyed, and Konrad; the former was immediately confirmed in Swabia by Henry V.; and in 1112 the latter received the duchy of Franconia. After the death of Henry V., his family estates fell to the house of Hohenstaufen; and Lothaire of Saxony was elected as his successor in the empire.

On Lothaire's accession, he revoked the grants made by previous emperors to the house of Hohenstaufen, and thus gave rise to a furious war, in which duke Frederick (his brother Konrad being absent in the Holy Land) had to encounter, single-handed, the whole power of the emperor, the house of Zähringen, and Henry the proud, duke of Bavaria and Saxony. After Konrad's return, fortune at first seemed to favor the brothers, but in 1135 they were compelled to implore the emperor's forgiveness. They were then put in possession of all their estates. Konrad, in 1138, was elected emperor of Germany, as Konrad III. The succeeding emperors of this family were Frederick I. (q.v.) (1152–90), Henry VI. (1190–97), Philip I. (1198–1208), Frederick II. (q.v.) (1212–51), and Konrad IV. (1251–54).

HOHENSTEIN, a small manufacturing t. in the kingdom of Saxony, 12 m. n.e. of Zwickau. Woolen, cotton, and linen goods, and machinery, are the principal manufactures. Pop. '71, 5,669.

HOHENZOLLERN, a province of Prussia, consisting of a narrow strip of land entirely surrounded by the territories of Würtemberg and Baden. Superficial area about 480 sq.m.; pop. '75, 66,466. The territory, whose surface is generally mountainous, is divided into the districts of Sigmaringen and Hechingen, which rank as mediatized principalities. The seat of provincial government is at Sigmaringen. Hohenzollern is watered by the Neckar and some of its affluents, and by the Danube, which crosses it; it is also traversed by the eastern offshoots of the mountain-ranges of the Black forest, the Rauhe Alb, and the Hart. The mountain valleys are productive, and yield an abundance of fruit and corn, and flax in sufficient quantities for exportation; the forests abound in fine timber; there are iron mines in some of the mountain districts, which also yield gypsum, salt, and coal. The principal branches of industry are agri-

culture and the rearing of cattle, and the manufacture of toys and other articles in wood.

The population belongs almost exclusively to the Roman Catholic religion, and is under the jurisdiction of the archbishop of Freiburg. There is a Catholic college at Hechingen.

The Hohenzollern family traces its descent from count Thassilo, who lived about the beginning of the 9th c., and founded a castle near Hechingen, on the Zollern heights, whence his descendants derived their patronymic. About 1165 the first separation took place, Frederic IV. founding the elder or Swabian, and Konrad I. the younger or Franconian line. The elder line was subdivided, in 1576, into the branches of Hohenzollern Hechingen and Hohenzollern Sigmaringen. Frederic VI., the representative of the younger line, in 1415 received from the emperor Sigismund the investiture of the electorate of Brandenburg, thus founding the present reigning dynasty of Prussia. The two branches of the elder line continued unbroken till 1849, when, in accordance with a family compact formed in 1821, which declared the king of Prussia chief of the joint houses, the reigning princes of Hohenzollern Hechingen and Hohenzollern Sigmaringen ceded their respective rights and principalities to that monarch, who agreed to pay an annual pension of 15,000 thalers to the former, and one of 25,000 thalers to the latter. The princes were to retain their estates and bear the title of highness, but were to exercise no act of sovereignty.

HO'HESCHIED, a t. of Rhenish Prussia, 17 m. e. by s. from Düsseldorf. It has extensive lead-works and iron-works. Pop. '75, 9,958.

HO'JO, a family of twelve Japanese rulers who held military authority in Japan from A.D. 1219 to 1333, living at Kamakura. They were overthrown by Nitta Yoshisada in 1333. Under their direction, the great Mongol invasion of Khublai Khan was repulsed.

HOKIAN'GA, a river of New Zealand, enters the Southern ocean on the w. coast of the North island—its mouth being in lat. 35° 30′ s., and long. 173° 26′ east. This point is almost the antipodes of Tangier, on the s. side of the strait of Gibraltar.

HOK'USAI (wrongly written Hokffsai or Hokesai), a Japanese artist who flourished during the first half of this century in Yedo, though he traveled largely over his native country sketching scenery, costume, and character; one of the ablest, most original, and versatile of the long roll of artists of Japan. His sketches have become familiar in Europe and America, since they have furnished magazine writers, artists, decorators, and designers in oil-colors, wood-engravings, silver-ware, embroidery, etc., with models, suggestions, and ideas. Hokusai's sketches are collected in the *Hokusai Tchon*, or series of albums embracing the entire range of Japanese pictorial art, and containing most of the stock subjects of Japanese artists. His *Fuji Hiakke* is a collection of "One Hundred Views of Fuji." See FUGI YAMA. See illustrations in Alcock's or Griffis's works on Japan, Jarvis's *A Glimpse of the Art of Japan*, Noah Brooks's articles in *Scribner's Magazine*, or any recent pictorial work referring to Japanese art or decoration.

HOLBACH, PAUL HEINRICH DIETRICH, Baron von, a French philosopher of the 18th c., was b. of wealthy parents, at Heidelsheim, in the Palatinate, in 1723. At an early age he went to Paris, where he continued to reside during the remainder of his life. He died June 21, 1789. As Holbach was remarkable for his agreeable social qualities, and kept a good table, the most eminent thinkers and writers of the day, such as Condorcet, Diderot, Duclos, Helvetius, Raynal, Rousseau, Buffon, etc., were in the habit of assembling at his house. The witty abbé Galiani called Holbach the *maître d'hôtel* of philosophy. Here speculation, it is said, was carried to such daring lengths that Buffon, D'Alembert, and Rousseau were compelled to withdraw from the circle. Holbach was the zealous champion of naturalism, and contended not only against Christianity, but against every positive religion. His principal work is the *Système de la Nature* (published in 1770). In this work the author endeavors to expound the natural principles of morality, and to investigate the origin of the conflicting opinions on virtue and vice. He discusses the maxims of religious morality, and takes a rapid survey of social and savage life. He touches on the so-called "social compact," and in the course of his observations tries to prove, among other things, that self-interest is the ruling motive of man, and that God is only an ideal being, created by kings and priests. The materialism of the French *philosophes* of the 18th c. is nowhere more pernicious and paltry than in the writings of Holbach. It is but fair to state that his life was better than his books. He was a man of good heart and, in spite of his theory, of most unselfish benevolence. When the Jesuits fell into disgrace during the reign of Louis XV., Holbach, though he hated their system and had written against them in the days of their prosperity, made his house an asylum for his old foes when the clouds gathered round them.

HOLBEIN, HANS, the Younger, one of the first masters of German art, was b. at Grünstadt in 1497. He learned the rudiments of art from his father, Hans Holbein the elder, also a painter of great merit (b. 1450, d. 1526). When little more than 16 years of age, he adorned several houses and churches at Basel with portraits, frescos, and altar-pieces. Tradition has preserved many of his droll sayings, and his life is as

rich in anecdotes as those of the greatest Italian painters. Holbein growing tired of Basel, Erasmus, who took a great interest in him and endeavored to induce him to abandon his irregular course of life, introduced him to sir Thomas More, who kept him employed in England for nearly three years, and then invited Henry VIII. to view the pictures. Henry, surprised and delighted, exclaimed: "Is the artist still alive, and is he to be had for money?" More presented Holbein to the king, who took him into his service and rewarded him liberally. Holbein continued to reside in England, highly esteemed and fully employed, till, in 1554, he died with the plague. Though chiefly, and at many periods of his life almost exclusively, a portrait-painter, in this style he stands on a level with the great Italian masters, and takes precedence of all his German contemporaries. His portraits are not ideals, but nature apprehended in its most intellectual features; the execution is rich and perfect. To the earlier part of his career belong his most celebrated paintings, including "The Last Supper," "The Dance of Death," several pictures in the Dresden gallery, two famous portraits of courtesans, etc. At a later period his execution is slighter, and his style of coloring not entirely free from the mannerism of those Flemish painters who had studied in Italy. Some splendid and able portraits by Holbein, belonging to this period, are to be seen in the Louvre at Paris, in the Berlin museum, at Longford and Windsor castles. Eighty-seven sketches of persons belonging to the court of Henry VIII. by Holbein are still extant. His "Dance of Death," the illustrations of the Old Testament, and three sets of alphabet initials, would certainly entitle him to rank as one of the first wood-engravers, supposing them to have been not merely designed but likewise engraved by him. This opinion has, however, been disputed, and the question remains undecided at the present day. A selection from Holbein's pictures in the library at Basel was published in lithographs in 1829, by Birmann & Sons, at Basel.—See Wolkmann, *Holbein und seine Zeit* (Leip. 1873–76).

HOLBERG, Ludvig, the creator of modern Danish literature, and not only the earliest but the wittiest and best writer of light comedy in Denmark, was b. in 1684 at Bergen, in Norway, at the period when the latter country formed part of the Danish dominions. The ten years which succeeded his appointment, in 1718, as professor of metaphysics in the university of Copenhagen, where he had studied with the original intention of entering the church, embrace the most active literary period of his life; for during that time he composed his various satirico-heroic poems and romances, and the greater number of his numerous comedies, which are still regarded by his countrymen as the best productions of their kind in the Danish language. The creation of a national theater in 1722 by king Frederick IV., who sent for French actors to teach Danish players the art of declamation, had led Holberg to try his talents in dramatic writing, and the success which attended the attempt was speedily followed by others still more felicitous. Wealth and honors poured in upon him as he advanced in years, and he received a patent of nobility in 1746. He died in 1754, bequeathing his property to the Danish royal military academy of Soroe. Holberg's collected works were published in 27 volumes octavo at Copenhagen in 1826; and in 1842 an association was established in that city for the better editing of his writings, the dramatic portion of which was edited by Liebenberg in 1843–47.

Holberg's first satirico-heroic poem of *Peder Paars* (1719), and his *Niels Klims underjordiske Reise* (1741), which appeared originally in Latin, but which was speedily translated into several modern languages, rank among his best productions, although among his numerous comedies there are many that have enjoyed an almost equal popularity. Of these we may instance, as especially notable for their broad humor and truth to nature, *Den politiske Kandestoober*, *Jeppe paa Bjerget*, *Den Stundesloese*, and *Julestuen*.

HOLBROOK, John Edwards, 1796–1871; b. S. C.; graduated at Brown university; studied medicine, traveled in Europe; practiced in Charleston, and became professor of anatomy in the state medical college. He published *American Herpetology, or Description of Reptiles of the United States*, and began an elaborate work on *Southern Ichthyology*.

HOLCOMBE, Amasa, b. Mass., 1787; a compiler of almanacs and teacher of engineering, surveying, and astronomy. In 1828 he began the making of telescopes, and was long without a rival in the United States. He was a member of the Massachusetts legislature, serving both in the house and the senate.

HOLCROFT, Thomas, 1745–1809; b. England; the son of a shoemaker and a follower of the same trade. Turned his attention to horse-training, then became successively a schoolmaster, an actor, and lastly a writer for the stage. He produced several excellent plays, one of which, *The Road to Ruin*, still keeps the stage. In the time of the French revolution he was indicted for high treason, but was never called up for trial. Besides some 30 plays he wrote four novels, and translated Lavater's *Physiognomy* and some of the works of Frederick the great. He also wrote *Travels in France and Germany*.

HOL'CUS. See Soft Grass.

HOLD is that interior compartment of a vessel throughout her length which is nearest to the keel. From the lowermost deck it extends to the very bottom of the ship; it is

always below the water-line, and dependent on the hatchways for ventilation and what little natural light it obtains. In merchant-vessels, the greatest portion of the cargo is stored in the hold; in men-of-war, it contains the bread-room, filled with provisions, the water-tanks for the supply of the ship's company, and almost all miscellaneous stores, such as spare masts, sails, blocks, etc. For this latter purpose, the hold is subdivided into several sections by bulkheads. The *after-hold* lies abaft the main-mast, the *main-hold* just before the same mast, and the *fore-hold* is from the bow nearly to the main hatchway.

HOLDEN, OLIVER, b. Mass., 1831; the author of the popular psalm-tune *Coronation* and of some other pieces. He published *American Harmony*, the *Worcester Collection*, and other books of music.

HOLDING, the term in Scotch law used to denote the manner in which heritable estate is holden, corresponding to the English tenure (q.v.). All the land in Scotland is presumed to be holden of the crown as the superior, and all persons who hold the lands are called vassals. The great proprietors are called crown-vassals; and the little proprietors, who generally hold under the crown-vassals, are called vassals. The chief holding is called feu-holding, which means that the vassal holds the land forever, subject to a feu-duty or annual payment in money or grain to the superior. Each vassal can carve out his land into smaller feus, and sell them to subvassals, to whom he stands in the relation of a superior, and so on to infinity. This is not a mere form, but enters into the substance of land transfers, and entails great expense on all landholders, because each vassal must always have his title complete, which means he must pay up the little dues and perquisites which constantly result out of this feudal principle to his superior. In England this practice of subinfeudation was put a stop to by 18 Edw. I., and now most of the land in England is held in freehold, which means that each owner is entire master of his land, and pays fees or perquisites to nobody, not even to the crown. Besides feu-holding in Scotland there is blench-holding, which means a holding where the payment is nominal. Formerly there were also ward-holding and mortification (q.v.), the latter being the holding by which churches and religious houses were held. There is also burgage-holding, applicable to lands within burghs (q.v.), and the transfer of burgage tenements has been lately put on a similar footing to other tenements.

HOLDING OVER, a phrase in English law, meaning that a tenant after a regular notice to quit, or the end of his term, still refuses to quit, and holds over. In such a case the tenancy is held to be renewed on the same terms from year to year, if the landlord chooses not to enforce the quitting; but if the tenant himself gave the notice to quit, or the landlord demands possession at the expiration of his notice, and then the tenant refuses to quit, he is thereafter liable to double rent or double value, according as the notice to quit came from the tenant or the landlord. In Scotland this renewal of the contract is called *tacit relocation* (q.v.); but no liability to double rent is incurred.

HOLIDAY, in law, means Christmas day, Good Friday, and any other day appointed for a public fast and thanksgiving. There are other holidays usual in public offices and courts of law. When a bill of exchange falls due on a Sunday, payment must be made the day previous. If it falls due on any of the bank holidays, the bill is payable the day after. In England the courts excuse a man for not giving notice of dishonor of bills of exchange not only on Sunday, Good Friday, and Christmas day, but also even on the festival days of his own religion; and though there has been no decision in Scotland on the subject, the same rule would no doubt be applied to fast-days prescribed by different sects, and a notice sent on the day following would suffice. But as a general rule, and in all other respects, it may be laid down that no sect, established or unestablished, nor any court or public body, has any power whatever to declare a holiday which has any legal effect, or which can bind the public or the rights of third parties. Nothing but an act of parliament has that effect, and not even a proclamation of the crown would be sufficient. Hence it is that when a solemn national fast is proclaimed, which is to be put on the same footing as a Sunday, it requires a special act of parliament to make it binding on the public in matters of business.

HOLINSHED, RAPHAEL, an English chronicler, was b. of a Cheshire family, in the early part of the 16th c., and died between 1578 and 1582. The work by which he is remembered is entitled *The Chronicles of Englande, Scotlande, and Irelande* (2 vols. fol., Lond. 1577). This edition—the first—is known as the "Shakespeare" edition, from the fact of its having supplied the great dramatist with materials for his historical plays. It contained some passages disagreeable to queen Elizabeth, which were omitted in the second edition of 1587. A modern edition, in 6 vols., was published in 1807–08, with the "disagreeable passages" restored. Holinshed, although the principal, was not the only author of these chronicles. He was assisted in his labors, among others, by William Harrison, who wrote the historical descriptions of the island of Britain; and by Richard Stanihurst, who contributed an account of the condition of Ireland, to which John Hooker added the "Conquest of Ireland" (a translation from the Latin of Giraldus Cambrensis). Holinshed has always been a great favorite with black-letter scholars, and has been freely used by modern historians.

HOLKAR, the name of a powerful Mahratta family, the members of which have at various times been formidable enemies to the British empire in Hindustan. The founder of the family was MULHAR RAO HOLKAR, who was born in the Deccan, 1693, and having gained by his valor the favor of the Peishwah, obtained from him the western half of Malwah, with Indore for his capital. In 1761 he joined the great league of the princes of Hindustan, formed to bar the progress of Ahmed Shah Durani, and was present at the battle of Paniput, Jan. 14, 1761; but as he fled shortly after the battle had commenced, he was suspected of treason. Holkar was the only Mahratta chief of note who returned from that dreadful slaughter. He died in 1768, and was succeeded by his niece, Aylah-Baee, who resigned the military power to TOKHAGI HOLKAR. On his death in 1797, his natural son, JESWUNT RAO HOLKAR, a man able, brave, and unscrupulous, seized Indore, but was driven out by Scindia. Such, however, was Holkar's reputation for energy and ability that part of the victorious army deserted to him, with whom and his own troops he obtained a signal victory over Scindia and the Peishwah (Oct. 1802). After fighting a long time against the British with varying success, he was compelled to conclude peace, and died insane, Oct. 20, 1811. His son, MULHAR RAO HOLKAR II., a minor nine years old, succeeded, and in 1817 declared war against the British, but his army was totally routed at Mahedpore, Dec. 21; whereupon he sent offers of peace, which were accepted, and *an English residency was established at Indore in Jan.*, 1818. He died in 1833. MARTUND RAO HOLKAR, HURRI RAO HOLKAR, and KUMDI RAO HOLKAR successively ruled after him; but the last of these dying without heirs, the East India Company assumed the right of nominating MULKERJI RAO HOLKAR, who was educated under the auspices of the British government, and who has displayed great ability since he assumed the reins of government in 1852. On the breaking out of the mutiny in 1857, he took the field in support of the British, but the refractory behavior of his troops prevented his rendering any effective assistance.

HOL'LAND, a name frequently applied to the kingdom of the Netherlands (q.v.), although in the strictest sense it is applicable only to the provinces of North and South Holland (q.v.).

HOLLAND, a city in Ottawa co., Mich., on Black river, and the Michigan shore railroad, about 4 m. from lake Michigan; pop. 2,469. It has a considerable number of manufactories, six churches, and four newspapers, two of which are in the Low Dutch language. A little lake 6 m. long, and of celebrated beauty, is near the city.

HOLLAND, Sir HENRY, Bart., M.D., F.R.S., D.C.L., etc., an eminent physician, b. at Knutsford, Cheshire, in 1788. He received his professional education in London, and subsequently at the university of Edinburgh, where he graduated as M.D. in 1811. He then spent two or three years in the e. of Europe; and in 1815, after his return to England, published his *Travels in Albania, Thessaly, etc.*, in a 4to volume. He settled in London, and soon rose to high eminence in his profession, of which he became one of the recognized heads. In 1828 he was elected a fellow of the royal college of physicians, a distinction at that time very rarely conferred upon a Scottish M.D. In 1840 he was appointed physician-in-ordinary to the prince consort, and in 1852 physician-in-ordinary to the queen. In the following year he was made a baronet. In 1856 the university of Oxford conferred on him the honorary degree of D.C.L., and he has likewise received the degree of LL.D. from the university of Cambridge, Mass. In 1840 he published a volume entitled *Medical Notes and Reflections*, consisting of 34 essays upon various of the most interesting departments of medicine and psychology, which has passed through several editions. In 1852 his *Chapters on Mental Physiology* appeared, which are expansions of those essays in his former work which treated of "that particular part of human physiology which comprises the reciprocal actions and relations of mental and bodily phenomena." His *Essays on Scientific Subjects*, published in 1862, and embracing the consideration of many of the most profound subjects in physics, show that if his special studies had taken a different direction, he would have attained fame as a natural philosopher. The *Recollections of Past Life* he published in 1871. Holland died Oct., 1873.

HOLLAND, Lord, HENRY RICHARD FOX, VASSALL-HOLLAND, Third Baron, F.R.S., an English statesman, was descended from Henry Fox, first baron, secretary of state to George II. Holland was born at Winterslow House, Wilts, in 1773, and succeeded to the title on the death of his father, the second baron, in 1774. He went to Eton, and thence to Christchurch. He was trained for public life by his celebrated uncle, Charles James Fox, and made his first speech in the house of lords in Jan., 1798. After the death of Mr. Fox, Holland held the post of lord privy seal in the Grenville ministry for a few months. He then shared the long banishment of the whigs from the councils of their sovereign. During this long and dreary interval, Holland, to use the language of Macaulay (who has paid an elegant tribute to his memory), was the "constant protector of all oppressed races and persecuted sects." He held unpopular opinions in regard to the war with France, and signed a protest against the detention of Napoleon at St. Helena. On the other hand, he labored to ameliorate the severity of the criminal code; made manful war, though a West India planter, on the slave-trade; threw his whole heart, though a landowner, into the struggle against the corn-laws; and although by rank and breeding an aristocrat, labored incessantly to extend and confirm the rights and lib-

arties of the subject. In 1830 he became chancellor of the duchy of Lancaster, and a member of the reform cabinet of earl Grey, and these posts he also held in the Melbourne ministry. He died at Holland house, Kensington, Oct. 22, 1840. In his ample person and expressive features he resembled his celebrated uncle.

HOLLAND, JOSIAH GILBERT, b. in Belchertown, Mass., July 24, 1819. His father, whose character is sketched in "Daniel Gray," was equally willing and unable to help his ambitious son to rise above his own humble lot in life. After many struggles, however, he graduated with honor from the Berkshire medical college, in Pittsfield, in 1844. He showed talent for writing at an early age, and in 1847 founded the *Bay State Courier*, which he gave up at the end of six months, and passed a year in Vicksburg, Miss., as superintendent of public schools. In 1849 he accepted the position of assistant editor on the *Springfield Republican*, and two years later became one of the proprietors of that paper. It was in the columns of the *Republican* that his *History of Western Massachusetts* first appeared. He became widely known as a lecturer. In 1868 he went to Europe for two years, and it was during this trip that he conceived the idea of *Scribner's Monthly*, which immediately upon his return was carried into effect. In Nov., 1870, the first number appeared, amid many prophecies of failure because there was no room for such a publication. It made room, however, and *Hours at Home*, *Putnam's Magazine* and *Old and New* successively resigned to it their respective subscription lists. Dr. Holland resides in New York city, and spends the summer at his place called "Bonnicastle," on one of the Thousand islands, which he recently purchased. His works, some of which were published under the assumed name of Timothy Titcomb, are: *The Bay Path*, a novel; *Letters to the Young; Bitter Sweet*, a poem; *Gold Foil; Miss Gilbert's Career*, a novel; *Lessons in Life; Letters to the Joneses; Plain Talk on Familiar Subjects; Life of Lincoln; Kathrina*, a poem; *The Marble Prophecy; Arthur Bonnicastle; Garnered Sheaves*, a poem; *The Mistress of the Manse; Sevenoaks;* and *Nicholas Minturn*.

HOLLAND, Sir NATHANIEL DANCE, 1734–1811; b. England; the son of George Dance, architect of the Mansion-house in London. He studied painting in Italy for several years, and on his return became distinguished, especially as a portrait-painter. After marrying a rich heiress, he relinquished his profession, and assumed the name of Holland, was made a baronet, and entered parliament. His portrait of Garrick in the character of Richard III. is one of his best works, and gives a good example of his style.

HOLLAND, PHILEMON, 1551–1636; b. England; the "translator-general of his age," as he was called by his contemporaries He was educated at Trinity college, of which he became a fellow. On being appointed to the rectorship of the free grammar-school of Coventry, he began a long series of translations from the classics. He also found time to carry on a very considerable practice as a physician. By a proper use and distribution of his time he reconciled his three professions of schoolmaster, doctor, and translator, fulfilling the functions of all three with undiminished vigor and assiduity till his 80th year. His chief translations are those of Livy, Plutarch's *Morals*, Suetonius, Ammianus Marcellinus, and the *Cyropædia* of Xenophon. He also did good service to literature by his edition of Camden's *Britannica*, to which he made some valuable additions.

HOLLAND, PARTS OF. See LINCOLNSHIRE.

HOLLAND, NEW, the name formerly applied to the island or continent of Australia (q.v.).

HOLLAND, NORTH, a province of the kingdom of the Netherlands, lying between 52° 10′ and 53° 18′ n. lat., and 4° 30′ and 5° 20′ e. long. Area, 1050 sq.m.; pop. '75, 629,345. North Holland consists of a peninsula joined to the mainland at its southern extremity, and of the islands of Wieringen, Texel, and Vlieland lying at its northern extremity. It is bounded on the w. by the German ocean, and on the e. by the Zuyder Zee. The surface is marshy, and in many places lies below the level of the sea, from whose encroachments it is protected by dunes and dikes, while canals intersect and drain it in every direction. The principal river is the Amstel. The canal from Amsterdam to Nieuwediep is an important water-way, but is now superseded (for large ships) by one through the peninsula, opened Nov. 1, 1876.

The Haarlem lake (q.v.) has been drained and converted into productive land, with a pop. (Dec. 31, 1874) of 12,570; but there still exist various small lakes or ponds in the marshy districts. The chief towns of the province are Amsterdam, Haarlem, Alkmaar, Zaandam or Saardam (q.v.).

HOLLAND, SOUTH, a province of the kingdom of the Netherlands, lying between 51° 45′ and 52° 20′ n. lat., and 3° 50′ and 5° 10′ e. long. Area, 1162 sq.m.; pop. '75, 748,162. It is bounded on the n. by North Holland, e. by Utrecht and Gelderland, s. by the Maas, which separates it from Zeeland and North Brabant, and w. by the German ocean. South Holland comprises the land around the embouchures of the Rhine and Maas, which is cut up in its southern portions into several islands—viz., Voorne, Overflackkee, and Goeree, Putten, Ysselmonde, Beijerland, etc.

The country is flat and low, and is broken by no elevation beyond the downs, which protect it from the sea. Streams and canals intersect it in all directions, and it abounds

with lakes and with *polders*, or lands that have been recovered from the sea or lakes by draining. One of the most noted of these is the Biesbosch, land recovered from a marshy lake which was formed by the terrible inundation of 1421. The chief rivers are the Old Rhine, the Yssel, Lek, Maas, and Merwede. The principal towns of South Holland are the Hague, Leyden, Rotterdam, Dordrecht, Gorinchem, Brielle, Gouda, Delft, and Schiedam (q.v.). The two provinces of Holland rank among the most populous districts of Europe, and their inhabitants are distinguished for industry and habits of great cleanliness. The rearing of cattle, of which there are upwards of a million in North and South Holland, and the preparation of butter and cheese, are the principal industries in the rural districts. Alkmaar, in North Holland, and Gouda, in South Holland, are the great centers of the cheese trade. In 1874 the cheese sold at Alkmaar weighed 8,705 cwts. The provinces of Holland enjoy the largest share of the national commerce and wealth.

HOLLANDS. See GIN.

HOLLAR, WENCESLAUS OR WENZEL, a celebrated engraver; b. 1607, in Bohemia. He was apprenticed to Matthew Marian, a pupil of Rubens and Vandyck, to learn engraving. He was only 18 when he published his first pieces, consisting of prints of the Virgin, the "Ecce Homo," and some other pieces. Leaving Prague he began a wandering life through Germany, taking views of the chief towns and of the most striking scenery of the Danube, Rhine, and other streams, which brought him great fame but no regular employment. Hollar's fortunes were at a very low ebb when he fell in with the earl of Arundel, who attached him to his service. Soon after reaching England with his patron he was appointed to instruct the prince of Wales in drawing; and in 1640 published his *Ornatus Muliebris Anglicanus, or the several habits of Englishwomen from the Nobilitie to the Countrywoman, as they are in these Times*. After the outbreak of the civil war he incurred the suspicions of parliament, and was imprisoned for a short time. Making his way to Antwerp, where lord Arundel was then residing, he wrought quietly and assiduously for print-sellers and publishers during several years. His pieces never having fetched prices at all proportionate to their merits, he was forced, in order to make a living, to place a price upon his time. He fixed his tariff at fourpence an hour, which he marked by a sand-glass. So exact was he that when any one, even his employers, came to speak with him about the picture on hand, he always turned down his glass, charging payment only for the time he was actually engaged with his burin. It was in this humble way that he produced his fine engravings after Da Vinci and the great masters of portrait-painting. On returning to England after the restoration, Hollar worked with the same unflagging industry, and with no more profitable result than in his younger days. His plates in Dugdale's *Monasticon* and *History of St. Paul's* attest his diligence. In 1669 he was commissioned by Charles II. to take plans and perspective drawings of Tangier and its fortifications, which, on his return to England, he engraved. His last known engravings are his unfinished illustrations of Throton's *Antiquities of Nottinghamshire*. These and other works occupied him till his 70th year, but without gaining for him an independence. On his very deathbed an execution was served upon his house. His last words were a petition to be allowed to die in his bed, and that he might not be removed to any other prison but his grave. It is not known whether this prayer was granted.

HOLLEY, ALEXANDER LYMAN, b. Conn., 1832; graduated at Brown university, and was educated as an engineer at the Corliss steam-engine works. He was the first who introduced the Bessemer process into America, and built the first Bessemer-steel works in this country, erected at Troy, N. Y., and, at a later period, similar works at Pittsburg, Harrisburg, Chicago, and elsewhere.

HOLLIDAYSBURG, the seat of justice of Blair co., Penn., on a branch of the Juniata river, and a branch of the Pennsylvania railroad; pop. '70, 2,952. There is a large trade by rail and canal; coal, iron, and grain are the main products. There are several foundries, blast-works, and rolling-mills, and some other manufactures.

HOLLIS, THOMAS, 1659–1731; b. England; a rich merchant of London who made bountiful bequests to Harvard college, of which the Hollis professorship of divinity is a memorial. He was a Baptist, but all he required was that the professor should be of sound orthodox principles. In 1727 he provided for a professorship of mathematics and philosophy, and gave many books to the library. One of his nephews was also a donor to the college.

HOLLOWAY, THOMAS, 1748–1827; b. London; celebrated as an engraver. His chief work was in the illustration of Lavater's *Essays on Physiognomy*, for which he made about 700 plates. He also engraved some of Raphael's cartoons.

HOLLOW-WARE. There are two classes of iron goods so-called—viz., cast-iron hollow-ware and wrought-iron hollow-ware. Both kinds include cooking and other vessels for domestic use, and comprise also some other articles, such as coffee-mills, which are molded and finished in a similar way. Wrought-iron hollow-ware is largely made by the process of stamping (q.v.), but a great deal is also made by the older way of joining pieces together. Vessels of this kind not intended for cooking are generally coated with zinc, while those which are have usually a coating of tin. Both metals are

put on the iron by immersion. There is also a process in use for coating the surface with silicious enamel, which will be described presently. Since the introduction of these methods of protecting and beautifying the surface of iron, domestic vessels of this metal have greatly taken the place of those made from copper and brass.

Cast-iron hollow-ware is finished in three ways—some of it is enameled, some tinned, and some of it is left *black*, or untinned; but there is comparatively little of the last now used. The process by which tinned hollow-ware is made was patented by Jonathan Taylor, a Birmingham workman, in 1779. It is conducted as follows: A vessel, such as a saucepan or goblet, is cast in a mold prepared in the ordinary way from an iron or a brass pattern. See FOUNDING. The vessel is then annealed (q.v.), so as to soften the cast-iron preparatory to turning, and such articles are then turned quite smooth on the inside, by means of a common lathe when they are circular, and by an oval lathe when they are oval like fish-pans, a workman holding and directing the tool in both cases. Self-acting lathes have been tried, but hitherto without any saving in the cost. The operation of tinning follows next, and is performed by the workman pouring small quantities of melted tin on the inside of the vessel, which he rubs on with a piece of cork, gradually going over the whole surface. A little sal-ammoniac is thrown in during the process to make the tin adhere. Handles of malleable iron are then put upon such vessels as require them, and a final finish is given to them by coating the outside with a black varnish which is dried in a stove. The covers of saucepans are made of tin-plate, those for tea-kettles of cast-iron.

With respect to the enameling of cast hollow-ware, a patent was taken out for this as far back as 1799; but the process then introduced, in which the enamel contained lead and tin, was ultimately abandoned. The subsequent patent of Messrs. T. & C. Clark, of Wolverhampton, taken out in 1839, has been more successful. Their enamel is applied to the cast-iron in two coatings, one of which forms the body of the enamel, and the other the glaze, both being free from metallic oxides. It is especially desirable to avoid the oxide of lead, as it does not resist the action of acid substances in culinary operations. As iron, in common with most metals, differs from any vitreous enamel in the rate of its expansibility by heat, there is of course a difficulty in securing the permanent adhesion of the two substances, especially with such an article as a cooking-vessel. In the case of cast-iron vessels, the difficulty has been practically overcome.

In England cast hollow-ware is made chiefly in the Midland hardware district, of which Birmingham and Wolverhampton are the centers. About 2,500 hands are employed, and the quantity of materials annually consumed is estimated at 12,000 tons of pig-iron, 1000 tons of wrought-iron, 177 tons of tin, and 23,000 tons of coke and coal. In Scotland there are also several manufactories of tinned hollow-ware, that of the Carron company having long been famous. Wrought-iron hollow-ware is made principally in Birmingham and the surrounding district, and the number of hands employed upon it is probably nearly the same as for cast-iron goods of this kind.

With regard to the comparative merits of the different varieties of hollow-ware, there is no doubt that the kind made of enameled cast-iron is, on the whole, the best for cooking purposes, although it is about one-fifth dearer than when merely tinned, and is, moreover, not liked by cooks for any but small-sized vessels, on account of its being somewhat heavy. Enameled wrought-iron cooking-vessels are much lighter to handle, but then upon them the enamel does not stand nearly so well, very probably because the comparatively rapid heating up of the thin iron of which they are made more rapidly destroys the adherence of the two substances. A great deal of cast-iron tinned hollow-ware is now made without being turned, an omission easily detected.

HOLLY, *Ilex*, a genus of trees and shrubs of the natural order *aquifoliaceæ*, chiefly natives of temperate climates; with evergreen, leathery, shining, and generally spinous leaves; small flowers which have a 4- to 5-toothed calyx, a wheel-shaped 4- to 5-cleft corolla, 4 or 5 stamens, and the fruit globose and fleshy, with 4 or 5 stones (*nuts*). The COMMON HOLLY (*I. aquifolium*), the only European species, and a native also of some parts of Asia, is a well-known ornament of woods, parks, and shrubberies in Britain, the stiffness of its habit being so compensated by the abundance of its branchlets and leaves, as to make it one of our most beautiful evergreens. It is found as a native plant in Scotland, although Britain is nearly its northern limit; and it attains a greater size and displays greater luxuriance in the northern than in the southern parts of its geographic range, often appearing in the former as a tree of considerable size, 20 to 50 ft. high, whilst in the latter it is generally a mere bush. It prefers light soils. There are numerous varieties of holly, produced, or at least perpetuated, by cultivation, exhibiting great diversity in the leaves, of which the *hedgehog holly* may be mentioned as extremely sinuous and spinous, whilst others are prized for their color, golden, silver-blotched, etc. The flowers of the holly are whitish, axillary, nearly umbellate; the fruit small, scarlet, rarely yellow or white. The abundance of the fruit adds much to the ornamental character of the tree in winter, and affords food for birds; but to man it is purgative, emetic, and diuretic, and in larger quantities poisonous. The leaves are inodorous, have a mucilaginous, bitter, and somewhat austere taste, and have been used medicinally in cases of gout and rheumatism, as a diaphoretic, and also as an astringent and tonic to correct a tendency to diarrhea, etc. The leaves and small branches, chopped, are

sometimes used for feeding sheep in severe winters. The root and bark are emollient, expectorant, and diuretic. Bird-lime (q.v.) is made from the inner bark. The wood is almost as white as ivory, very hard and fine-grained, and is used by cabinet-makers, turners, musical-instrument makers, etc., and sometimes for wood-engraving. Handles of tools and handles of metal tea-pots are very often made of it. The holly is often planted for hedges, as it bears clipping well and makes an excellent fence. A holly hedge may either be kept low or, as is the case at Tyninghame, in East Lothian, allowed to grow to the height of 20 or 30 feet. In the gardening of former days, hollies were often clipped into fantastic shapes. The name holly is said to be derived from the use of the branches and berries to decorate churches at Christmas, from which the tree was called holy-tree.—Numerous other species of holly are found in North America, most of them in swampy situations, in South America, Nepaul, Japan, and other parts of the world; some of which have now become not unfrequent ornamental trees and shrubs in Britain.—Maté (q.v.), or *Paraguay tea*, is the leaf of a South American species of holly (*I. Paraguensis*).

HOL'LYHOCK, *Althæa rosea*, a plant of the natural order *malvaceæ*, commonly referred to the same genus with the marsh mallow (q.v.). It has a tall, straight, hairy stem; heart-shaped, crenate, wrinkled, 5- to 7-angled leaves, and large axillary flowers almost without stalks; the leaves diminishing into bracts, and the upper part of the stem forming a spike; the petals hairy at the base. The hollyhock is a native of India, the south of Europe, etc., is to be seen in almost every garden in India, and has been much cultivated in gardens in Britain from a very early period. At present it is a favorite flower, and varieties, the result of cultivation, are very numerous. It varies much in the color of the flowers, and double and semi-double varieties are common. It is an autumnal flower, continuing till the frost sets in. It is a biennial or perennial plant. The stem rises to a height of 8 to 15 feet, unbranching, or nearly so. The fibers of the plant have been made into yarn, but it is not yet certain if it is really valuable for cultivation on this account, or for the manufacture of paper. It is not improbable that it might be cultivated with advantage to afford green fodder for cattle, which are very fond of its leaves, and the leaves are produced in great abundance if the plant is prevented from flowering. The flowers are mucilaginous and demulcent, and are sometimes used like those of mallows and marsh mallows. The leaves yield a fine blue dye.—The CHINESE HOLLYHOCK (*A. Chinensis*) is an allied species.

HOLLY SPRINGS, a t. in northern Mississippi, United States, on the Central railway, 25 m. s. of its junction with the Memphis and Charleston line. It is the principal town in northern Mississippi, and contains several churches, four academies, a bank, and two or three newspapers, with a large trade in cotton and merchandise. Pop. '70, 2,406.

HOLLY SYSTEM OF STEAM HEATING. See WARMING AND VENTILATION.

HOLLY WATER-WORKS. See WATER SUPPLY.

HOLMAN, JAMES, 1789–1857; b. England; at the age of 25 he became blind, nevertheless he traveled in France, Italy, and Switzerland, and published his impressions in a book which was at once popular. He then undertook a journey around the world, starting from St. Petersburg; but he was arrested on suspicion of being a spy, sent across the frontier, and returned home. Between 1827 and 1832 he made a voyage around the world, and published an account of it in 1834. In 1843–44 he made a tour of the Danubian principalities and Transylvania.

HOLMBOE, CHRISTOPHER ANDREAS, b. Norway, 1796; distinguished as a philologist; in 1822 professor in Christiania university. He published philological works in Norwegian, Danish, German, French, and Latin.

HOLMES, a co. in n.w. Florida, on the Choctawatchie river; 470 sq.m.; pop. '70, 1572—137 colored. The surface is level and the soil chiefly alluvial, producing corn, cotton, and sugar. Co. seat, Cerro Gordo.

HOLMES, a co. in w. Mississippi, on the Yazoo and Big Black rivers, crossed by the New Orleans, St. Louis, and Chicago railroad; 800 sq.m.; pop. '70, 19,370—13,225 colored. It has a level surface, with many cypress swamps and considerable forest land. Chief productions: cotton, corn, and pork. Co. seat, Lexington.

HOLMES, a co. in n.e. central Ohio, intersected by the Cleveland, Columbus, and Mount Vernon, and the Pittsburg, Fort Wayne, and Chicago railroads, and the Walhonding river; 420 sq.m.; pop. '80, 20,775. The surface is hilly and largely covered with forests; soil fertile. Chief productions: corn and pork. Co. seat, Millersburg.

HOLMES, ABIEL, D.D., LL.D., 1763–1837; b. Conn.; graduated at Yale, where he was a tutor and student of theology; in 1785 had charge of a parish in Georgia; resigned 1791 and settled in Cambridge, Mass., where he was pastor of the first parish for 40 years. His principal work was the *Annals of America*, an elaborate and careful chronology of American history. He also wrote *Life of President Styles* (whose daughter he married).

HOLMES, GEORGE FREDERICK, b. British Guiana, 1820; educated in England, in 1888 came to America and taught in an academy in Virginia, afterwards in South Caro-

lina and in Georgia. He was for a time one of the editors of the *Southern Quarterly Review*, and in 1847 was professor of history, political economy, and international law in William and Mary college. In 1846 he was president of the university of Mississippi, and in 1857 professor of history and literature in the university of Virginia. He prepared a series of text-books for the use of schools in the southern states, in which the sentiments and selections were made with reference to the justification of slavery.

HOLMES, JOHN, b. Mass., 1773; graduated at Brown university, and settled in Maine and practiced law. He was in the convention that formed the state constitution, four years a representative in congress, 12 years in the U. S. senate; afterwards in the state legislature, and lastly U. S. district-attorney.

HOLMES, OLIVER WENDELL, M.D., an American physician and author, was b. at Cambridge, Mass., Aug. 29, 1809. In 1829 he graduated at Harvard college, and entered upon the study of law, but soon adopted his father's profession—medicine. He studied in Europe, graduated as doctor of medicine in 1836, and two years after was appointed professor of anatomy and physiology in Dartmouth college; and in 1847 was transferred to the same chair at Harvard, the medical department of which is at Boston, where he has since resided. Dr. Holmes is not only a man of science, but a humorous and satirical poet of much ability. Several of his lyrics also are among the most exquisite produced in America. Most of his poems have been delivered before college literary societies, as *Poetry, a Metrical Essay; Terpsichore; Urania;* and *Astræa*. In 1857 he contributed his *Autocrat of the Breakfast Table*, a connected series of prose essays, to the *Atlantic Monthly*, which was followed by *The Professor at the Breakfast Table* and *The Poet at the Breakfast Table* (1872). A remarkable work is the singular romance, *Elsie Venner* (1861). Dr. Holmes is one of the most popular of public lecturers. Of medical writings may be mentioned *Boylston Prize Dissertations; Lectures on Homeopathy and its Kindred Delusions;* a *Report on Medical Literature*, besides articles in professional periodicals. In 1868 he published a second novel, entitled *The Guardian Angel;* and in 1870, *Mechanism in Thought and Morals.*

HOLMES, OLIVER WENDELL (*ante*). Dr. Holmes is the son of the rev. Abiel Holmes, D.D., long pastor of the First Congregational church in Cambridge and author of *American Annals.* He was born in the old "gambrel-roofed" house to which he makes frequent allusion in his works, and which is directly opposite the buildings of Harvard college, with which his relations have been intimate and almost continuous for more than fifty years. His earliest verses were written for the *Collegian*, a paper conducted by Harvard undergraduates, and many of his minor poems have been called forth by the anniversaries of the class of 1829, of which he is the most famous member, but which included Benjamin Pierce, the mathematician; justice Benjamin R. Curtis, of the supreme court; George T. Bigelow, chief-justice of Mass.; and among the living, James Freeman Clarke and William H. Channing. On leaving college he read law for a time, but subsequently devoting himself to the study of medicine, became extremely skillful both in the theory and practice of his profession. The psychological problems raised by the interdependence of mind and matter have long occupied Holmes's attention, and are scientifically discussed in his *Currents and Countercurrents in Medical Science* (1861), and in *Mechanism and Morals.* His romance *Elsie Venner* deals with the same subject from an artistic standpoint. He was one of the founders of the *Atlantic Monthly*, to whose success his productions—and in particular his best prose work, the *Autocrat of the Breakfast Table*—have largely contributed. Of his humorous verses the *One Horse Shay* and the *September Gale* are, perhaps, best known. *The Nautilus* and *Avis*, among those in a serious vein, deserve mention. Dr. Holmes is the most graceful of American writers of *vers de société*. His more labored poems are written in pentameters, but he employs successfully a variety of lyric measures. Most of his later verse has been written for special occasions. His most recent work is the *Iron Gate* (1880). Besides his contributions to medical periodicals, he has written for the *North American Review* and the *International Review.*

HOLMES, OLIVER WENDELL, JR., son of Dr. Oliver Wendell, graduated at Harvard in 1861, served in the federal army during the rebellion, read law, and is a member of the Boston bar. He has published the 12th edition of Kent's *Commentaries*, revised to conform to the present state of the law, and with full and learned annotations. Holmes has been editor of the *American Law Review*, for which he wrote a series of articles on the growth of legal conceptions.

HOLM OAK, or HOLLY OAK, the ilex of the Romans; an evergreen of s. Europe and n. Africa noted for beauty and the exceeding durability of its timber.

HOLOCAN'THUS, a genus of fishes of the family *chætodontidæ* (q.v.), remarkable for the great beauty and symmetry of their colors, and for their excellence as articles of food. They have the very compressed form and other general characters of the *chætodontidæ*, a single dorsal fin, and a large spine on the gill-cover. They are natives of the seas of warm climates. *H. imperator* is one of the most esteemed fishes of the East Indies, rivaling the salmon in flavor. Its greatest size is about 15 in. long; its color is deep blue, with numerous narrow bands of orange, the pectoral fins black, the tail bright yellow. It is known in some parts of the east as the *emperor of Japan.*

HOLOCAUST. See SACRIFICE.

HOLOFERNES. See JUDITH.

HOLOGRAPH (Gr. *holos*, all, and *graphe*, writing), deed or writing, in Scotch law, means a writing in which the author or maker does his own penmanship. Considerable privileges are given to this species of writing, whereas in England and Ireland it is in general utterly immaterial whose penmanship is used, provided the party sign or seal the writing or deed. In Scotland, if a person execute his will or a deed in holograph, this dispenses with the usual formalities which would be requisite if he merely signed a paper written by another hand, for no witnesses are required to attest holograph deeds or testaments. If the handwriting, however, is disputed, evidence must be given as to whose handwriting it is. In England it is quite immaterial whether a person writes out his own will or not; in either case there must be two witnesses. So in the case of holograph missive writings and accounts, there is a difference as to the period of prescription applicable in Scotland, but in England there is no distinction merely on this ground. The distinction between holograph and other deeds also prevails in the law of France and other continental countries.

HOLOPTY'CHIUS (*holos*, all, and *ptychè*, wrinkle), a remarkable genus of fossil ganoid fishes, so named from the wrinkled appearance of the enameled scales. They were of large size, some species probably reaching the length of 12 feet. The small head was covered with large tuberculated plates, like those of the crocodile, and the body was completely encased in large scales, more like those of a reptile than a fish. Some scales have been found measuring 3 in. in length by 2¼ in breadth, and a full eighth of an inch in thickness. They were composed internally of porous bone, in numerous layers, arranged alternately at right angles to each other, and the outside was covered with a bright glossy corrugated enamel. The spines of the fins were large and hollow; the bones were partially ossified; the center remained in its original cartilaginous condition, and consequently appears hollow in the fossil. The jaws were covered with hard enamel instead of skin, and were furnished with a double row of teeth; the outer row, placed along the edge of the mouth, were small and thickly set; the inner range were widely set, and very large, at least twenty times the bulk of the others. A specimen was obtained at Clashbennie, on the firth of Tay, by Mr. Noble; it now forms part of the British museum collection. It is a foot across by 2½ ft. long without the tail, which is wanting. It is nearly perfect, lying on its back, with the scales and the ventral fins in their original position.

The genus is peculiar to the old red sandstone and carboniferous measures; eight species being found in the former, and nine in the latter. The name holoptychius is now generally confined to the fossils of the old red sandstone, and that of rhizodus, which Owen applied to the teeth remains before their connection with the fish was known, has been given to the holoptychians of the coal measures, which have the outer row of teeth more robust and obtuse, and the inner set longer, sharper, and more slender than in the older species.

HOLOTHU'RIA, a genus of *echinodermata* (q.v.), the former limits of which are now those of a family, *holothuridæ*, divided into numerous genera. SEA-SLUG and SEA-CUCUMBER are popular names of some of the animals of this family. The *holothuridæ* have not the covering of calcareous plates characteristic of the more typical *echinodermata*, but a soft leathery muscular integument, very irritable, and capable of great distention and contraction. Some of them are almost globose, some so much elongated as to be almost worm-like; but the same individual is often capable of extending itself to several times the length which it has in a state of repose. In locomotion, the body is extended and contracted as by the annelides, but the principal organs of locomotion, as in star-fishes and sea-urchins, are suckers or *ambulacra* (q.v.), of which there are usually five double rows, whilst sometimes they are distributed over the whole surface of the body; but some of the species have the suckers developed only on a disk, and the body then presents an upper and an under surface. The radiate structure is most apparent in the mouth, which is surrounded with tentacles, in number always a multiple of five, exhibiting great variety of beautiful forms, and capable of being completely retracted. Little is known of the food of the *holothuridæ*, which, however, probably consists of small marine animals. Within the opening of the mouth there is a circle of teeth. There is no proper stomach. The intestine is often very complicated. The respiratory organs are near the anus, and consist of branching tubes. The organs of both sexes are found in each individual. The young pass through several stages or transformations, in which they are very unlike their parents; in their first stage, after leaving the egg, they swim vigorously by means of membranous expansions of the body. The *holothuridæ* are capable of the most extraordinary reproduction of parts, even of the most important organs. They are found in all seas, but particularly abound in the Red sea, and between the s. of Asia and Australia. The largest European species, *H. (cucumaria) frondosa*, occasionally found in the British seas, is about a foot in length, and capable of extending itself to 3 feet. Most of the British species are small, and they are not of a pleasing appearance as they usually come under observation, although the expanded tentacles give them beauty in their proper abodes. But many of the tropical species

exhibit splendid colors, and are among the creatures which make the bottom of the sea, particularly among coral reefs and islands, gay and lovely as a garden.

The *bêche-de-mer* (q.v.), or trepang, so much esteemed as a delicacy by the Chinese, belongs to this family.

HOLSTEIN, formerly a duchy belonging to Denmark, and at the same time a member of the Germanic confederation, was annexed in 1866 to Prussia. It is separated from Sleswick on the n. by the river Eyder and the Sleswick-Holstein canal; is bounded on the e. by the Baltic sea, the territory of Lübec, and the duchy of Lauenburg; on the s. by the Hamburg territory and the river Elbe, which separates it from Hanover; and on the w. by the North sea. Area, 3,270 sq.m.; pop. 554,510. The principal rivers, besides the Elbe and the Eyder, are the Stör and the Trave. Of the surface of the land, one-eighth consists of marshes. The central districts of the province are occupied by an undulating plain, varied by low hills, and traversed from n. to s. by a heathy and sandy ridge, from which the land falls away gradually on the e.—where the surface is varied by lakes and fertile well-wooded valleys—and on the west. The soil, with the exception of several tracts of sand and heath, is very fruitful, and is most luxuriant in the marshes. The climate and natural productions closely resemble those of similar districts in the n. of Germany. Salt and lime are the only minerals found. Amber is obtained on the eastern coast, and the interior abounds in peat. The manufactures of Holstein are inconsiderable; agriculture and the rearing of cattle are the chief employments of the people. The history of Holstein and its political relations are noticed in the article SLESWICK.

HOLSTERS, cases for pistols affixed to the pommel of a saddle. They are frequently covered with wool or fur, to prevent injury to the rider in the event of his being thrown forward upon them.

HOLSTON, a river and branch of the Tennessee, rising in Virginia and running s.w. through a fertile valley at the base of Cumberland mountains, joining the Clinch river in Roane county. Its extreme length is about 350 miles. Steamboats of light draught come up as far as Knoxville.

HOLT, a co. in n.w. Missouri bordering on Kansas and Nebraska, between the Missouri and Nodaway rivers; crossed by the Kansas City, St. Joseph and Council Bluffs railroad; 470 sq.m.; pop. '80, 15,510—225 colored. The surface is undulating and there are high bluffs along the Missouri river. The soil is good; chief productions: wheat, oats, corn, and butter. Co. seat, Oregon.

HOLT, a co. in n. Nebraska on the Dakotah border, s. of Niobrara river, and drained in part by the Elkhorn; 2,100 sq.m.; pop. '80, 3,287. Co. seat, O'Neill City.

HOLT, Sir JOHN, 1642–1709; b. England; lord chief-justice of the court of the king's bench in the reign of William. His father, sir Thomas Holt, had been sergeant-at-law, and his eldest son, John, followed the profession of law. After having been entered at Oriel college, Oxford, as a gentleman commoner, he became a member of Gray's inn in 1658. He soon displayed a decided predilection for the study of law, became an able advocate, and well versed in the constitutional law of England. He was made recorder of London in 1685, which office he held for a year and a half, when he became unpopular at court. It had been determined to abolish the test act; but the measure was opposed by Holt, and in consequence he had to retire from the office of recorder. Subsequently, in 1686, he was made sergeant-at-law. The ability which he displayed in the convention parliament raised him so high in the estimation of the prince of Orange, that, upon the accession of the latter to the English throne, Holt was made lord chief-justice of the king's bench. Upon the removal of Somers in 1700 from the chancellorship, William was desirous that Holt should accept the great seal, but he declined.

HOLT, JOSEPH, b. Ky., 1807; received a collegiate education, and in 1832 began the practice of law in Louisville. In 1857 he was commissioner of patents, and in 1859 postmaster general. When Floyd, secretary of war, went over to the rebellion in Dec., 1860, Holt assumed charge of the department. In 1862 he was made judge advocate general of the army.

HÖLTY, LUDWIG HEINRICH CHRISTOPH, 1748–76; b. at Mariensee, near Hanover. He studied theology at the university of Göttingen, and became a member of the society of poets formed by Bürger, Müller, and count C. Stolberg. He had a very delicate constitution, and died at the early age of 28, while preparing a collection of his poems. They were published in 1783 by his friends Stolberg and Voss, and became very popular.

HOLTZENDORFF, FRANZ VON, b. Prussia, 1829; studied law at Heidelberg and Bonn, was professor in Berlin, and in 1867 was chosen a member of the North German parliament. He has published a number of works on legal and political subjects.

HOLY ALLIANCE, a league formed after the fall of Napoleon by the sovereigns of Russia, Austria, and Prussia, nominally to regulate the relations of the states of Christendom by the principles of Christian charity, but really to preserve the power and influence of the existing dynasties. Most of the other European rulers acceded to it,

and the treaty was formally made public in the *Frankfort Journal*, Feb. 2, 1816. It was in virtue of this league that Austria, in 1821, crushed the revolutions in Naples and Piedmont, and that France, in 1823, restored absolutism in Spain. Subsequently, both France and England seceded, after which it became a mere *nominis umbra*. A special article of the treaty excluded forever the members of the Bonaparte family from any European throne!

HOLY COAT, a relic preserved with the greatest reverence in the cathedral of Treves, of which city it is esteemed the greatest treasure. It is alleged to be the seamless coat of our Savior, and to have been discovered in the 4th c. by the empress Helena, in her memorable visit to Palestine, and by her deposited at Treves. The Treves relics were concealed from the Normans in the 9th c. in crypts; but the holy coat was rediscovered in 1196, and then solemnly exhibited to the public gaze, which did not take place again till 1512, when multitudes flocking to see and venerate it, Leo X. appointed it to be exhibited every seven years. The reformation and wars prevented the regular observance of this great religious festival; but it was celebrated in 1810, and was attended by a concourse of no fewer the 227,000 persons; and in 1844 by still greater multitudes, whilst miraculous cures were confidently asserted to be performed by the precious relic. The exhibition of the holy coat in 1844 is otherwise memorable for the reaction which it produced, leading to the secession of Rongé and the German Catholics from the church of Rome.—For further information see *The Book of Days*, published by W. & R. Chambers.

HOLY COMMUNION, Sisters of the, founded in New York in 1845 by ladies of the Protestant Episcopal church, mainly through the influence of rev. W. A. Muhlenberg. Their duties are the care of the sick. They take no vows, nor have they any fixed style of dress.

HOLY CROSS, Congregation of the, founded in 1834 in France, and in 1842 in the United States, where they have many establishments, including a college at Watertown, Wis. In Europe they are called cross-bearers or croisiers.

HOLY FAMILY, the name given, in the language of art, to every representation of the infant Savior and his attendants. In the early part of the middle ages, when the object in view was to excite devotion, the Virgin and child were usually the only persons represented. At a later period, Joseph, Elizabeth, St. Anna (the mother of the Virgin), and John the Baptist, were included. Some of the old German painters have added the twelve apostles as children and playfellows of the infant Christ, as well as their mothers, as stated in the legends. The Italian school, with its fine feeling for composition, was the first to recognize of how many figures the group must consist, if the interest is to remain undivided, and be concentrated on one figure, whether that figure be the Madonna or the child. Two masters are pre-eminent in this species of representation—Leonardo da Vinci and Raphael.

HOLY FIRE, in the church of Rome, a light kindled at Easter, by sparks struck from a flint, in remembrance—according to the missal—of Christ as the great corner-stone, and hailed by kneeling ecclesiastics with the words "Light of Christ" (*Lumen Christi*). The ceremony takes place on Holy Saturday, of which day's service it forms a striking part; and at Rome it takes place in the presence of the pope himself; all the lights in the chapel having been previously extinguished, to be rekindled at the new fire.—The kindling of the holy fire in the church of the Holy Sepulcher at Jerusalem, at the Easter of the oriental church, is represented as miraculous. The Greek and Armenian clergy combine on this occasion, and amidst processions, solemnities, an excited multitude, and scenes disgraceful not only to the name of religion but to human nature, the expected fire makes its appearance from within an apartment in which a Greek and an Armenian bishop have locked themselves.

HOLY GHOST, or Holy Spirit, in orthodox theology, the third person of the Trinity (q.v.), proceeding from the Father and the Son, yet of one substance, majesty, and glory with the Father and the Son, very and eternal God. His distinct personality is believed to be attested by a multitude of passages in Scripture, which it is unnecessary to quote. One may suffice: "But when the Comforter is come, whom I will send unto you from the Father, even the Spirit of truth, which proceedeth from the Father, he shall testify of me" (John xv. 26). The "procession" (q.v.) of the Spirit is the subject of one of the chief differences between the eastern and the western or Latin churches. He is essentially a spirit of holiness, and his grand function is to apply to the hearts of men the benefits of Christ's death, to work in them, first, a belief of the truth as it is in Jesus, and then to sanctify them by that truth.

HOLY GRASS, *Hierochloe borealis*, a grass about a foot high, with a brownish glossy lax panicle. It is found in the most northern parts of Britain, and in the n. of Europe. It has a sweet smell, like that of vernal grass; and in Iceland, where it is plentiful, it is used for scenting apartments and clothes. In some countries it is strewed on the floors of places of worship on festival-days, whence its name.

HO'LYHEAD, a seaport, parliamentary borough, and market town of North Wales, in the county of Anglesea, is situated on a small island of the same name, 24½ m. w.n.w. of Bangor, and 272 m. n.w. of London. Although recently much improved, it is still

a primitive, irregularly built town. It is the station of the mail steam-packets to Dublin, from which it is distant about 69 miles. The harbor of Holyhead, which is almost dry at low tide, is formed by a pier about 1000 ft. in length, running n.e. from an islet called Salt island, which is connected with the mainland by a swivel-bridge. Few manufactures are carried on here. Pop. '71, 5,916, who are employed in the coasting-trade, and in ship-building and rope-making. The fine harbor of refuge incloses an area of about 400 acres, and is protected by a breakwater 7,860 ft in length; seven million tons of stone were used in this work. Holyhead unites with Amlwch, Beaumaris, and Llangefni in sending a member to the house of commons.

HOLYHEAD ISLAND, a small island of North Wales, lies w. of the island of Anglesea, and forms part of the county of that name. Its greatest length is 7½ m., and its greatest breadth about 3½ miles. Area, about 6,000 sq. acres; pop. '71, 8,595. Holyhead island is separated from Anglesea by a narrow sandy strait crossed by the Holyhead road and the Chester and Holyhead railway, which are formed by embankments or causeways, arched in the center, to admit of the passage of the water. The island, which comprises some good pasture-grounds for sheep, as well as a proportion of arable land, is for the most part rocky and barren. On the n.w. coast are two islets, the North and South Stacks, the latter with a light-house, the light of which is visible at 20 m. distance. The South Stack is connected with the island of Holyhead by a suspension-bridge. The Stacks and the north coast of the island of Holyhead are hollowed out by the action of the sea into magnificent caves, which are the haunt of innumerable sea-fowl. Principal town, Holyhead (q.v.).

HOLY ISLAND, or LINDISFARNE, a small island of England, belonging to the county of Northumberland, and situated about 10 m. s.e. of Berwick-on-Tweed. It is about 4 m. long and 2 m. broad, and is connected with the mainland by sands 3 m. in extent, which can be traversed at low-water by vehicles of all kinds. Pop. of parish, 1871, 876; but, including the chapelries of Kyloe and Ancroft (which are both in the ancient parish), and called *Islandshire*, 3,764. On the s. coast is the village of Holy Island, finely situated, and now much resorted to by summer visitors. On the island are several ruins, the chief of which are the extensive and somber-looking remains of the famous abbey of Lindisfarne, originally a Saxon edifice; there is also an ancient castle, now fortified and occupied by a party of artillery. In former times, Holy Island was the seat of a bishopric.

HOLY LAND. See PALESTINE.

HOLY LEAGUES, the name given to certain political alliances in Europe; the principal are as follows: 1. In 1511, between the pope, Spain, and Venice, the object being to expel the French from Italy. 2. In 1538, between Charles V. and the Roman Catholic princes of Germany in opposition to the league of Schmalkend. 3. In 1571, the pope, Spain, and Venice against the Turks. 4. Of the Guise family, the pope, Spain, and the French parliament against the Huguenots. 5. In 1609, between the pope and the Roman Catholic states of Swabia and Bavaria. 6. In 1684, of Poland, Germany, and Venice against the Turks.

HOLY MAID OF KENT. See BARTON, ELIZABETH, *ante*.

HOLYOAKE, GEORGE JACOB, b. England, 1817; he was a student and teacher of mathematics in Birmingham, and while still young became noted as an advocate of extreme radicalism. He has taken great interest in the theory and practice of co-operation, and has published a *History of Co-operation in Rochdale*, where the pioneer association was established in 1844. He has for several years been the editor of *The Reasoner*, an organ of secular liberalism, or a system of civilization based upon secular and not upon theological ideas. He is a strong advocate of the utmost freedom of thought, opinion, and of action, with due regard to the rights of others. In the autumn of 1879 he visited the United States, and spoke in New York and other places on co-operation.

HOLYOKE, a city of Hampden co., Mass., on the w. bank of the Connecticut river, on the New Haven and Northampton and the Connecticut river railroads; 80 m. s.w. of Boston; pop. of town, '75, 16,260. Holyoke is a rapidly growing manufacturing city, at the South Hadley falls, the greatest water power in New England, within a mile and a half of the city, is a dam 30 ft. high and 1000 long, throwing the water into a canal 3 m. in length, which can furnish power enough to drive a million spindles. Paper is the leading article of manufacture, and there are 15 or 20 mills, employing more than 2,000 persons. About as many persons are engaged in cotton factories. The city has broad and pleasant streets, nine churches, and a fine city hall of rough split granite. One of the objects of interest is a costly monument to the soldiers who fell in the war of the rebellion.

HOLYOKE, EDWARD AUGUSTUS, LL.D., 1728–1829; b. Mass.; a physician who lived beyond the advanced age of 100 years, retaining all his faculties to the last. He graduated at Harvard college, of which his father was president, and began the practice of medicine in Salem, Mass., in 1749, and continued actively in his profession for 79 years. He was twice married, and had 12 children, of whom only two survived him. He attributed his longevity to his careful attention to the laws of health, and especially to regular sleep. At the age of 80 he had lost some teeth, was slightly deaf, and used

convex glasses in reading, but as he grew older his sight strengthened, and in his 101st year he could read the smallest print without the aid of spectacles. He was present at a dinner given in honor of his 100th birthday, and responded to the congratulations of the guests in suitable words.

HOLYOKE, MOUNT, 3 m. s.e. of Northampton, Mass., is a ridge of greenstone some 1120 ft. above the sea level, very frequently visited by tourists. A carriage road winds upwards to the summit, but since the opening of the mountain railway, passengers generally prefer that method of ascent, being drawn up in small cars by a stationary engine. In 1821 a hotel was opened on the summit, from which a magnificent view is obtained. The carriage road is nearly 4 m. in length, and the ascent by rail is almost precipitous, in one instance rising 365 ft. in perpendicular height by an incline 600 ft. long. In the first 12 years after its opening 125,000 persons availed themselves of the railroad. The view from this summit has long been famous as one of the finest in New England, not for its extent or grandeur, but for a quiet loveliness due to the windings of the Connecticut river amid charming meadows and near and distant hills, while the broad and fertile valley, highly cultured and dotted with villages, gives the scene a domestic interest. The prospect, however, has a wide range in some directions.

HOLY PHIAL, or SAINTE AMPOULE, ORDER OF, the name of an order of knighthood which formerly existed in France, and was composed of four persons, usually the first in point of rank, family, and fortune in the province of Champagne, and styled *Barons de la Sainte Ampoule.* At the coronation of the French kings, they were delivered to the dean, priors, and chapter of Rheims, as hostages for the fulfillment of the engagements entered into by the great officers of the crown to return the holy phial in which the coronation oil was kept, and which, according to the legend, was brought from heaven by the Holy Ghost under the form of a dove, and put into the hands of St. Remy at the coronation of Clovis—an enormous crowd having prevented the messenger from bringing in time that which had already been prepared. The peculiarity of this order was that the knights were only knights for a day. Their badge was a cross of gold enameled white, cantoned with four fleur-de-lis, and on the cross a dove descending with a phial in its beak, and a right hand receiving it.

HOLY PLACES—HOLY SEPULCHER. Under the head Jerusalem (q.v.) are enumerated many localities which, from the memories associated with them, must be full of solemn interest for every religious mind; but the name holy places of Jerusalem more strictly designates the group of sacred places of which the church of the Holy Sepulcher is the center, and which are supposed to comprise the sites of the chief events of our Lord's passion, death, and burial: Gethsemane, the supper-room, the church of the Ascension, the tomb of the virgin, etc.

In the article JERUSALEM, the general topography of the ancient and modern city is briefly described. The so-called church of the Holy Sepulcher stands within the modern city, on the n.w. or Latin quarter. It is a Byzantine building, in the center of a spacious inclosed court. Under the great dome of the church stands the holy sepulcher, which is of an oblong form, 15 ft. by 10, and is surmounted by a rich ceiling, decorated with gold, silver, and precious marble. A circular hall surrounds the space beneath the dome. Around this circular hall are oratories for the Syrians, Copts, and Maronites; and above it is a series of galleries, which are similarly appropriated. In the body of the church are the chapels of the Greek, Latin, and Armenian Christians, the church as a whole being maintained by the Ottoman authorities in the condition, as it were, of a common meeting-ground for all the Christian communions, as the rivalries of the several religious bodies constantly lead to angry controversy, and not unfrequently to sanguinary conflicts. Opposite the entrance of the inclosure is a somewhat elevated marble slab, which is called the stone of unction, and is shown as the stone on which our Lord's body was anointed before entombment; and above is an elevation approached by steps, which is the traditionary Mt. Calvary, and on which now stands a rich dome-shaped building, floored with rich marbles, in the crypt of which is the cavity supposed to have been formed by the erection of the cross. The street by which this site is approached, from the direction of the ruins of Herod's palace, on the n. side of the city, is the principal street of the Latin quarter, and is called by the Turks *Harât-el-Albam,* and by the Christians the *Via Dolorosa,* as being the supposed route of our Lord from the hall of judgment to Calvary.

Such is the traditional view as to the locality, not only of these leading events of our Lord's history, but also of many others of minor importance, and less prominently noticeable. For a long course of ages, the Christian world unhesitatingly acquiesced in this view of the topography of the holy places; but since the beginning of last century, doubts have been entertained as to its correctness; and in late years the question has been discussed with much learning, although with little positive, or at least conclusive, result. About the year 1730, a German, named Korte, who had visited Jerusalem, and explored the locality, published a work, calling the authenticity of the received system of sacred topography into question. The doubts expressed by him have been repeated at intervals ever since his day, and especially by the celebrated American critic, Dr. Robinson, author of *Biblical Researches in Palestine,* who may be said in two successive investigations to have exhausted the evidence on one side of the question, at least so

far as the remains of the ancient city had at that time been explored. Dr. Robinson distinctly affirms the impossibility of reconciling the received sacred localities with the plain requirements of the gospel history; but he fails himself to point out a scheme of topography which may be substituted for that which has been traditionally received. More recent critics, and especially Mr. James Ferguson, in an *Essay on the Ancient Topography of Jerusalem*, agreeing with Dr. Robinson in rejecting the received topography, contends against him that the true site of the holy sepulcher can be accurately determined, and that it is no other than the mosque of Omar, or, as the Mohammedans call it, the "dome of the rock." This he holds to be the identical church which Constantine erected over the rock which contained the tomb of our Lord. Dr. Stanley, a late biblical traveler in Palestine, left the question undecided. We can here do nothing more than refer the reader to the chief authorities on each side of the controversy. See, on the one side, Robinson's *Biblical Researches in Palestine;* Smith's *Dictionary of the Bible*, article "Jerusalem" (Ferguson); *Essay on the Ancient Topography of Jerusalem*, by the same author. On the other, Williams's *Holy City;* Raumer's *Beiträge zur Bibl. Geographie;* Sepp's *Forschungen eines Deutschen Reisenden in Jerusalem;* Schaffter's *Aechte Lage des heiligen Grabes.* Under the auspices of the Palestine exploration fund, diligent researches are now being carried on at Jerusalem, and several important discoveries have been made. See an account of the excavations in *Underground Jerusalem*, by capt. Warren, R.E. (London, 1876).

HOLYROOD. In the year 1128, king David I. of Scotland founded at Edinburgh an abbey of canons regular, of the order of St. Augustine. It was dedicated in honor of the holy cross or rood, which was brought to Scotland by St. Margaret about the year 1070, and became one of the heirlooms of the kingdom. The black rood of Scotland (q.v.), as it was called, fell into the hands of the English at the battle of Neville's Cross in 1346, and as its history passed from remembrance, a fable sprung up telling how king David was prevailed upon by his young nobles to go a hunting on the solemn festival by which the church yearly commemorated the finding of the holy cross at Jerusalem; how the chase lay through the forest, which in those days encircled Arthur's Seat, and stretched almost to the gates of Edinburgh; how the king, in pursuit of a wild hart, outrode all his companions; how at the foot of Salisbury crags the hart turned to bay, and overthrew the king's horse; how as it rushed at the king, threatening him with instant death, a cross, as if from between its antlers, miraculously slid into the king's hands; how at the sight of it the hart fled and vanished; and how the king, warned by a vision in his sleep, resolved to build a monastery in honor of the holy rood on the spot where his life had been so preternaturally saved. When this legend was invented, apparently about the year 1420, it had been forgotten that the first site of the abbey was not at the foot of Salisbury crags, but within the walls of the castle, whence it was not finally removed until after the year 1174, to the eastern extremity of the Canongate, as the little burgh came to be called which the canons erected between their abbey and the king's burgh of Edinburgh. The abbey was burned by the English in 1385, in 1544, and in 1547. Before it could be restored after these last conflagrations, the reformation arrived, when the ruins of the choir and transepts were taken down to repair the nave. This was used as the parish church of the Canongate from about 1560 till 1672, when it was turned into the chapel-royal. In 1687 king James VII., having built another parish church for the Canongate, set the nave of the abbey church apart for the Roman Catholic service, and had it fitted up with stalls for the knights of the thistle. It was plundered and burned by the mob at the revolution in 1688, and remained in neglect until 1758. In that year it was repaired and roofed, but the roof was too heavy for the walls, and it fell in 1768, crushing the pillars of the n. aisle, and otherwise injuring the building.

The abbey of Holyrood early became the occasional abode of the Scottish kings. John Baliiol held a parliament within its walls in 1295. James II. was born in it, crowned in it, married in it, buried in it. The foundations of a palace, apart from the abbey, were laid by James IV., whose splendid nuptials with the princess Margaret of England were celebrated here in 1503. Edinburgh had now become the acknowledged capital of Scotland, and Holyrood henceforth was the chief seat of the Scottish sovereigns. Queen Mary took up her abode in the palace when she returned from France in 1561. Here, in 1566, Rizzio was torn from her side, and murdered. Her son, king James VI., dwelt much in Holyrood before his accession to the throne of England in 1603. He revisited it in 1617. It was garrisoned by Cromwell's troops after the battle of Dunbar in 1650, when the greater part of it was burned down. It was rebuilt by king Charles II., from the designs of sir William Bruce of Kinross, between 1671 and 1679. In 1745 and 1746 it was occupied in succession by prince Charles Edward and by the duke of Cumberland. It sheltered the count d'Artois (afterwards king Charles X. of France) from 1795 to 1799, and again from 1831 to 1835. King George IV. held his court in it in 1822. Since that time much has been done to make it a suitable residence for the sovereign, and queen Victoria has occasionally made a short stay here.

The oldest part of the palace is the n.w. tower, founded by king James IV. about 1500, and completed by his son, king James V., who died in 1542. It was somewhat

modernized in 1671–79; and the roofs, if not the floors also, were renewed by king Charles I. (1625–49), whose cipher they bear; but otherwise the disposition of the rooms seems to be much the same as in the days of queen Mary. It need scarcely be added that the furniture is much more recent, and that the articles shown as relics of Mary and her court are wholly spurious.

The palace, with its precincts and park, is a sanctuary for debtors. In England the same privilege extends to royal palaces to this extent, that no writ of legal process can be executed within their bounds; but this practically is only a protection to the servants of the palace; and no means exist for insolvent persons taking lodgings in a privileged place there or elsewhere, and avoiding imprisonment, in so systematic a way as is competent to residents within the precincts of Holyrood palace, where there is ample accommodation. The precincts comprehend the adjoining park and the hills of Arthur's Seat and Salisbury crags. Refugee debtors must procure a certificate of protection within 24 hours from the proper official within the bounds. Taking refuge within the sanctuary is considered disreputable, and from this cause, as well as from recent meliorations in the laws affecting debtors, the practice is greatly fallen off. It is to be added that the sanctuary of Holyrood shelters debtors to the crown.

HOLY SEPULCHER, KNIGHTS OF THE, an order of knighthood instituted, probably by pope Alexander VI., for the guardianship of the holy sepulcher, and the relief and protection of pilgrims. The pope was originally the grand-master, but he subsequently ceded his rights to the guardian father of the holy sepulcher. The knights must, by the rules of the order, be all of noble descent; they were bound to hear mass daily, to fight, to live, and to die for the Christian faith, etc. In return for these duties, the knights had the most unusual and extraordinary privileges conferred on them: they were exempt from taxation, could marry, and yet possess church property, legitimize bastards, and cut down and bury the bodies of criminals who had been hanged. On the recapture of Jerusalem by the Turks, the knights retired to Italy, and settled at Perugia. After a temporary union with the hospitalers, the order was reconstructed in 1814 both in France and in Poland, and is still in existence within a very small circle of knights elected by the guardian father from the most respectable pilgrims who come to Jerusalem.

HOLY SPIRIT PLANT, or DOVE PLANT, names given to a Central American orchid, the *peristeria elata*. The flower stem is 5 or 6 ft. high, bearing upon its upper portion numerous tulip-shaped, fragrant white flowers. The stamens and pistils in the orchid family are united in a column, and in this particular plant they present the appearance of a dove with expanded wings within a spherical alabaster white vase formed by the petals. It is used in religious festivals in Central America as the symbol of the form in which the Holy Spirit descended at the baptism of our Lord.

HOLY WATER, in the Roman Catholic, as also in the Greek, Russian, and oriental churches, signifies water blessed by a priest or bishop for certain religious uses. Water is, almost of its own nature, a fitting symbol of purity; and accordingly, in most of the ancient religions, the use of lustral or purifying water not only formed part of the public worship, but also entered largely into the personal acts of sanctification prescribed to individuals. The Jewish law contained many provisions to the same effect; and our Lord, by establishing baptism with water as the necessary form of initiation into the religion instituted by him, gave his sanction to the use, which, from its universal acceptance among mankind, appears to be a relic of the primeval natural revelation. The usage of sprinkling the hands and face with water before entering the sanctuary, which was prescribed in the Jewish law, was retained, or at least very early adopted, in the Christian church. It is expressly mentioned by Tertullian in the end of the 2d century. And that the water so employed was blessed by the priests we learn, among others, from St. Jerome, and from the apostolical constitutions. Although it is difficult to fix the precise time, it cannot be doubted that the practice of mingling salt with the water is of very ancient origin (see Canon 20, *De Consecr. Dist.* iii.). In the western church there is a solemn blessing of water in the service of Holy Saturday, but the ceremonial is repeated by the priest whenever it may be necessary to replenish the fountain. Instructed Catholics regard the use of holy water chiefly as a means of suggesting to the mind the necessity of internal purity; and although it is supposed to derive from the blessing a special efficacy for this end, yet this efficacy is held to be mainly subjective and of a character entirely distinct from that ascribed to the sacramental rites of the church. In the reformed churches the use of holy water is regarded as unscriptural and superstitious.

HOLY WEEK, the week immediately preceding Easter, and specially consecrated to the commemoration of the passion of our Redeemer. In English use, it is also called "passion week" (a name appropriated, in Roman use, to the week before Palm Sunday). This institution is of very early origin, and the name holy week is but one of many by which its sacred character has been described. It was also called the "great week," the "silent week," the "week of the holy passion," the "vacant week," the "penitential week." In the Roman Catholic church, the special characteristics of the celebration of the holy week are increased solemnity and gloom, penitential rigor, and mourning. If any of the ordinary church festivals fall therein, it is transferred till

after Easter. All instrumental music is suspended in the churches, the altars are stripped of their ornaments, the pictures and statues are veiled from public sight; manual labor, although it is no longer entirely prohibited, is by many persons voluntarily suspended; the rigor of fasting is redoubled, and alms-deeds and other works of mercy sedulously enjoined and practiced. All church services of the week, moreover, breathe the spirit of mourning, some of them being specially devoted to the commemoration of particular scenes in the passion of our Lord. The days thus specially solemnized are Palm Sunday, Spy Wednesday, Holy (or Maundy) Thursday, Good Friday (q.v.), Holy Saturday. Holy Thursday (called also Maundy Thursday, from *mandatum*, the first word in one of the church services of the day), in the Roman Catholic church, is specially designed as a commemoration of the Last Supper, and of the institution of the Eucharist. But there are several other services annexed to the day, as the solemn consecration of the oil or chrism used in baptism, confirmation, orders, and extreme unction, the washing of pilgrims' feet, and the tenebræ. To Holy Saturday belongs the solemn blessing of fire and of the water of the baptismal font; and from the earliest times it was set apart for the baptism of catechumens, and for the ordination of candidates for the ecclesiastical ministry. From the fire solemnly blessed on this day is lighted the Paschal light, which is regarded as a symbol of Christ risen from the dead. This symbolical light is kept burning during the reading of the gospel at mass throughout the interval between Easter and Pentecost. See Wetser's *Kirchen-Lexicon*, art. "Charwoche." It must be added, however, that in many instances the primitive institution of the holy week was perverted, and that the suspension of labor, which was originally designed for purposes of devotion and recollection, was turned into an occasion of amusement not unfrequently of a very questionable character. Such abuses are now universally discountenanced by the ecclesiastical authorities.

In the Protestant communions there is no special solemnization of the holy week, with the exception of Good Friday (q.v.), which is observed in some of them.

HO'LYWELL, a municipal and parliamentary borough, and market t. of North Wales. in the co. of Flint, and 4½ m. n.w. of the town of that name, is situated on an eminence on the line of the Holyhead and Chester railway, and near the south-western shore of the estuary of the Dee. It is the center of an immensely valuable mineral district, and is the seat of numerous establishments for lead and copper smelting, manufacturing shot, zinc, etc. There are also manufactures of cottons, flannels, and galloons, paper, and Roman cement; coal and lead mines, and limestone quarries, are worked. This borough unites with those of Flint, Mold, etc., in returning a member to parliament. Pop. '71, 7,961.

Holywell is now one of the most important and flourishing towns of North Wales. It owes its origin to the renowned well of St. Winifred, which is estimated to deliver twenty-one tons of water per minute, and is said to be the most copious spring in Britain. Its waters were at one time believed to be efficacious in curing diseases, and were visited by great numbers of pilgrims.

HOMAGE is the service or show of respect due from a knight or vassal to his lord in feudal times. The word is derived from the form of expression used in doing the service, which was—*jeo deveigne vostre home*—I become your man. Since the abolition of tenures, the word has no substantial legal meaning in the law of England, except in a limited sense as to copyholds, to denote the kind of acknowledgment made by a tenant to the lord of the manor. The homage jury consisted of the tenants who did homage, and their presence was necessary to attest some acts. *Homagium reddere* was the expression, now obsolete, signifying a solemn renunciation of homage or fealty to the lord, and a defiance of him. The word homage is not used in Scotch law, though the feudal system is not obsolete in Scotland in many other respects.

HOMALOP'SID-Æ, a family of serpents distinguished by having flat, plate-like spaces on their heads and on the abdomen. The family comprises a number of genera, five or six of which are found in North America.

HOMALOP'TERA (Gr. level-winged), the name given by some entomologists to a small order of insects, which has been more generally regarded as a division of the order *diptera*. The homaloptera have also been called PUPIPARA, from the remarkable circumstance that the larvæ are hatched within the body of the mother, and remain there till they have passed into the pupa state. Some of the homaloptera are wingless. Examples of this order are found in the forest fly (q.v.), and in those extraordinary parasites of bats called *nycteribia*. All the homaloptera are parasites.

HOM'BURG VOR DER HÖHE, a pleasant little t. in the province of Hesse-Nassau, Germany, is situated at the foot of the Taunus mountains, 9 m. n.w. of Frankfort-on-the-Main. It has beautiful environs, and is much frequented on account of its mineral waters and, until recently, gambling saloons. The waters are considered very effective in cases of disordered liver and stomach. They are five in number, and one of them, the *Elizabeth*, contains more carbonic acid than any saline spa known. About 400,000 bottles of the "waters" of Homburg vor der Höhe are annually sent away. Pop. '71, 8,626; '75, 8,294.

HOME, DANIEL DUNGLAS, b. Scotland, 1833; especially noted as a spiritualist. When a child he came to the United States, and at 17 years of age was extensively known as a medium, and the most surprising stories were told of his powers and his manifestations. In 1833 he began the study of medicine, but soon gave it up and visited Europe. While in Rome he joined the Roman Catholic church. At St. Petersburg in 1858 he married a Russian lady of noble birth. She died in 1862, leaving a son. In 1864 Home was expelled from the city of Rome by the church authorities for his spiritualistic practices. For some years he was conspicuous in London, and in 1871 he married another Russian lady of rank. He has published a number of works on spiritualism.

HOME, Sir EVERARD, 1755–1832; was of Scotch extraction, and his connection with the Hunters brought him into notice early in life. At one time he was held in high estimation as a surgical practitioner. He was one of the surgeons to St. George's hospital; and this circumstance, added to the publication of various works which attained a considerable share of celebrity, contributed greatly to extend his reputation. In 1813 he was created a baronet, and was also appointed sergeant-surgeon to the king. He was the author of *Practical Observations on Stricture; Lectures on Comparative Anatomy;* and of various papers in the *Philosophical Transactions.*

HOME, HENRY (Lord KAMES), an eminent Scottish lawyer and author, was b. in 1696 at Kames, in Berwickshire. Destined by his friends for the law, he was apprenticed in 1712 to a writer to the signet; but he afterwards decided on adopting the highest branch of his profession, and qualified himself for it mainly by private reading and attendance at the courts. Entering the bar in 1723, he was raised to the bench in Feb., 1752, assuming the title of lord Kames, and was made one of the lords of justiciary in 1763. He died Dec. 27, 1782. In 1728 he published *Remarkable Decisions of the Court of Session from* 1716 *to* 1728. The materials of this work were in 1741 embodied in his *Dictionary of the Decisions of the Court of Session* during its whole history, which, though now superseded, was of great use to lawyers at the time, and was thought worthy of being continued by lord Woodhouselee. He is best known, however, by his *Essays on the Principles of Morality and Natural Religion* (1751), containing a solution of the question of human freedom, which brought on him the suspicion of infidelity, and raised considerable controversy in the courts of the church and through the press; his *Introduction to the Art of Thinking* (1761); and above all, his celebrated *Principles of Criticism,* the work on which his fame now chiefly rests. In 1773 appeared his *Sketches of the History of Man,* which may be found entertaining, but are now of very little scientific value. Though thus busily occupied with judicial and literary labors, he took a very active interest in agriculture and commerce, and wrote a useful tract on the former, entitled *The Gentleman Farmer, being an Attempt to improve Agriculture by subjecting it to the Test of Rational Principles.* His last work, *Loose Thoughts on Education* (1781), was written in his 85th year. See lord Woodhouselee's *Memoirs of the Life and Writings of Home* (2 vols. 4to, Edin. 1807).

HOME, JOHN, a Scotch clergyman and dramatist, was b. in 1722. He studied for the church, and was appointed to the parish of Athelstaneford, where he wrote his tragedy of *Douglas,* which was acted in Edinburgh, and received with the utmost enthusiasm. The production of this piece gave great offense to his clerical brethren, and he was finally compelled to retire from the ministry. He retired into England, where he obtained the protection of the earl of Bute, and received a pension. His other dramatic works are *Agis; Agnileia; The Fatal Discovery;* and *Alonzo*—every line of which has departed from the memory of mankind. He died in 1808.

It is difficult now to understand the enthusiasm with which *Douglas* was first greeted. It was praised by men of all ranks, and Burns—who should have known better—talks of Home having

Methodized wild Shakespeare into plan.

This enthusiasm has departed long ago. Still *Douglas* contains pathos, and amid its florid declamation there may be found not a few natural touches, and it is on account of these that it still haunts the stage in a shadowy kind of way.

HOME'LYN (*raia miraletus* or *maculata*), a species of ray (q.v.), common on the s. coast of England, and plentiful in the London market, but comparatively rare on the e. coast of Scotland. In form and appearance it more nearly resembles the thornback than the skate. On some parts of the British coast the homelyn is called sand ray. It is also known as the spotted ray.

HOMEOP'ATHY, from two Greek words signifying "similar suffering," is a system of medicine introduced into practice about the close of last century, by a German physician of the name of Hahnemann (q.v.). It is founded upon the belief that medicines have the power of curing morbid conditions similar to those which they have the power to excite; expressed in Latin by the phrase, *similia similibus curantur,* and in English by "like cures like." That diseases are cured by substances which produce in persons in health symptoms like those presented by a patient, has been from the earliest times a recognized fact, both by medical writers and by poets who have expressed the prevailing belief of the ages in which they lived. Among the former, we find the author of a treatise generally ascribed to Hippocrates, entitled *On the Places in Man.* This writer

gives numerous examples of what may be called *homeopathic* cures; and recommends for the cure of mania this remarkable prescription: "Give the patient a draught made from the root of mandrake, *in a smaller dose than sufficient to induce mania.*" The works of the poets abound with illustrations of this belief. Probably the oldest expression of it is in some lines ascribed by Athenæus to Antiphanes, who lived 404 B.C., which have been thus translated:

> Take the hair, it is well written,
> Of the dog by which you're bitten;
> Work off one wine by his brother,
> And one labor with another;
> . . . .
> Cook with cook, and strife with strife,
> Business with business, and wife with wife.

Shakespeare, in *Romeo and Juliet,* thus expresses the same maxim:

> Tut, man! one fire burns out another's burning;
> One pain is lessened by another's anguish.
> . . . .
> Take thou some new infection to the eye,
> And the rank poison of the old will die.

Milton, in the preface to *Samson Agonistes,* gives his version thus: "In physic, things of melancholic hue and quality are used against melancholy, sour against sour, salt to remove salt humors," etc. Thus, there has always been a vague tradition that medicines sometimes cured diseases similar to those they caused. But it was reserved for Hahnemann to propound the startling dogma, not only that medicines did occasionally produce such cures, but that true, direct, and radical cures could only be effected by recognizing this principle as the guide for the selection of the right remedy in any given morbid condition of the system. He engaged his friends and disciples in the task of procuring accurate data on which to proceed in reducing his rule to practice. They took given quantities of the substance which was the subject of experiment, and each kept a record of the effects it produced. The various records thus obtained were submitted to Hahnemann, who compared them together, and with his own observations on himself, and out of the results thus obtained, compiled what goes by the name of "a proving" of the medicine. Hahnemann lays it down as one of the fundamental propositions of homeopathy, that no medicine should be given to the sick which has not first been *proved* upon those in health. He devoted himself to this task, and has left ten volumes of such "provings;" out of this work the various abridgments in popular use in this and other countries have been derived. The properties once determined, then, it becomes possible to administer it in accordance with the principle of homeopathy. To do so, however, it requires that the medicine should be given by itself. Thus, the second proposition of Hahnemann's system is, "that only one medicine should ever be given at once."

To ascertain the effects of medicinal substances upon persons in health—from the knowledge thus obtained to select a remedy whose action corresponds with the symptoms of the patient under treatment—to give this remedy by itself alone, are three of the fundamental rules for the practice of homeopathy. The fourth is, that the dose of a homeopathic medicine should be so small as not to cause any general disturbance of the system, its action being limited to that portion of the body which is in a morbid condition. How small that is can be ascertained only by experiment. When Hahnemann propounded his system, he pointed out that the amount of the effect of a medicinal substance depends upon two conditions: *first,* the mechanical form in which it is administered; and *second,* the state of the body of the person who takes it.

For example, a hard pill of belladonna of five grains, swallowed by a robust and healthy man, may be followed by only trifling symptoms; but let that pill be dissolved in a pound of water, and an ounce of the solution be given every hour, then we shall have well-marked symptoms of the poisonous action of the drug. But if, instead of administering it to a person in rude health, it be given to one who is suffering from such an inflammation of the tonsils as belladonna produces, then we shall find that the inflamed tonsils will be most acted upon by their specific irritant. Disease implies a preternatural sensitiveness. An inflamed eye cannot bear light, an inflamed stomach cannot bear food, and every diseased organ is powerfully affected by the particular substance which has, in its physiological operation, a close affinity with the character of the morbid condition in which it is at the time its specific medicine is administered.

To arrive at the degree to which it was desirable to reduce the dose, a series of experiments were necessary. It was a matter to which all *à priori* reasoning was inapplicable. In an article published in *Hufeland's Journal* in the year 1801, Hahnemann observes: "You ask me what effect $\frac{1}{100000}$th of a grain of belladonna can have. The word *can* is apt to lead to misconceptions. Let us ask nature what effect $\frac{1}{100000}$th of a grain of belladonna *has.*" He then states the conditions of the experiment—viz., that this fraction of a grain should be administered to a patient suffering from a peculiar form of scarlet fever then prevalent in Germany, and presenting a combination of symptoms bearing a close resemblance to those produced by belladonna. Hahnemann

maintained that this fraction of a grain was sufficient for the purposes of homeopathic cure.

Homeopathic doses are often expressed by fractions, thus: Suppose the medicine to be a vegetable substance; a strong tincture is made of it, and this is technically called the *mother-tincture*. Two scales of dilution are now prepared from this, called respectively the *decimal* and the *centesimal*, which latter was that advocated by Hahnemann, while the former, though of recent introduction, is at present very largely employed. To prepare the *decimal* attenuations, 1 drop of mother-tincture is added to 9 drops of alcohol, and it is labeled 1^x. The *second decimal dilution* (2^x) is formed by adding 9 drops of spirit to 1 drop of 1^x, and so on for the 3^x, etc. In preparing the *centesimals*, 1 drop of mother-tincture is added to 99 drops of alcohol, so as to dilute it 99 times, and this preparation is called *the first dilution*, and marked 1. Again, a drop of number 1 —that is, of the $\frac{1}{100}$th of a drop of the mother-tincture—is mixed with other 99 drops of alcohol, and marked 2, or the second dilution. This contains $\frac{1}{100}$th of a drop of $\frac{1}{100}$th of a drop of the mother-tincture, or $\frac{1}{10000}$th of a drop of the mother-tincture. This simple process of subdivision is continued, and each step is recorded in the same way: thus, number 3 means a millionth; number 6, a billionth; and number 30 (which is the highest recommended by Hahnemann), a decillionth. Insoluble substances, of course, cannot be thus treated; they are triturated with sugar of milk. One grain, say, of sulphur is triturated with 99 grains of sugar of milk, forming *the first trituration*, and marked number 1, and so on; but after advancing to the fifth or sixth, then it is presumed that all substances become soluble in this very minute proportion in alcohol, and alcoholic dilutions are made of them in the same way as of the vegetable tinctures. After making these alcoholic preparations, the homeopathic chemist saturates with them minute pellicles of sugar of milk, known technically by the name of *globules* or *pilules*.*

A system so revolutionary naturally encountered most determined opposition. In Germany there were legal obstacles to its practice. In Austria physicians were not allowed to dispense their own medicines, even gratuitously; all medicines administered to the sick were prepared by the apothecaries, and the fate of homeopathy could not be trusted to their hands, as their interests were deeply involved. Thus it happened that, from the year 1818 to the year 1836, homeopathy was only tolerated in Austria under exceptional circumstances. In 1836 cholera broke out for the second time in Vienna, and Dr. Fleischmann, the physician to an institution in which homeopathy has been followed, was required by government to prepare the hospital for the reception of cholera patients. He undertook the charge, on the condition that he was to be allowed to employ homeopathy in their treatment. This was granted, homeopathy having been very successful in Vienna and different towns in Germany in cholera in 1830-31. He treated 732 cases; of these, 488 recovered and 244 died. The hospital was under daily inspection by the government, and the result of the treatment was made known to count Kolourat, the home-minister. Shortly after, the emperor issued an ordinance granting to every duly qualified physician the right of practicing homeopathy. The cholera mortality under homeopathic treatment was in this instance one in three, while the average mortality of the same epidemic at the same place was two in three.—Wilde's *Austria*.

When cholera was approaching western Europe, Hahnemann was studying his "provings," to ascertain what substance resembled most nearly in its effects the symptoms of the disease. The medicine he found to be camphor; and before he had ever seen a case of cholera, guided by the details given by practitioners, he announced in the year 1831: "Every one, the instant any of his friends is taken ill of cholera, must immediately give him camphor." This bold prediction, that camphor was the antidote for the first stage of cholera, was soon tested in Hungary and Moravia, and camphor has since been accepted universally by homeopathists as the most efficient remedy against an invasion of cholera.

The reported success of the homeopathic treatment of cholera at Vienna had a powerful influence in directing public attention to the hospital where the new system was practiced. Physicians from all parts of Europe and from America went thither to watch the treatment. In a report published by Dr. Fleischmann some years ago, it is stated that at that time he had treated 17,313 cases, chiefly of acute diseases. Among these were—of erysipelas, 514 cases, of which 510 recovered; of rheumatic fever, 1417, of which 1416 recovered; of intermittent fever, 1066, of which 1058 recovered; of inflammation of the lungs, 1052, of which 1004 recovered.

From Germany as a center, where it is now extensively practiced and taught, homeopathy spread over Europe and America. In America there are upwards of 2,000 avowed practitioners of the system. In France, Italy, Spain, and other countries it has numerous adherents, many of whom occupy influential positions of trust and authority. It was introduced into England in the year 1827 by Dr. Quin, physician to the king of the Belgians; and there are now above 300 registered practitioners in Britain

* It must, however, be borne in mind that small doses are not necessarily homeopathy, which consists in the administration of drugs according to the law of *similars*, the dose being a matter in which experience has guided to dilutions in many though not in all cases.

who have adopted it. In London there is a hospital capable of containing upwards of 100 patients, where lectures are occasionally delivered by appointed teachers.

The number of physicians who *avowedly* practice homeopathy has not greatly increased of late; but its adherents claim that the *actual* practice of it has been greatly augmented. In proof of this they point to the more recent text-books in medicine, published by the teachers of the dominant school; and to the recognition of the value of small doses of aconite in inflammatory fevers, arsenic in gastritis, ipecacuanha (in one-drop doses) in vomiting, etc.

The objections entertained by physicians to the so-called "homeopathic" practice of medicine are based, not upon any unwillingness to employ medicines whose action resembles more or less the features of the disease for which they are prescribed, but solely on the impossibility, according to the common view, of adopting this as a specific rule of practice, and especially as an exclusive and all-embracing law of therapeutics. The action of emetics in some kinds of indigestion, and of rhubarb in some kinds of diarrhea, are familiar examples in daily use, showing that ordinary practice is not regulated by any blind prejudice against what is called the homeopathic law of *similia similibus curantur;* but in these cases the physician does not in the least commit himself either in favor of or against the law, but rather sets it aside as a mere metaphysical abstraction, having nothing to do with the real principle of the cure, which is to be found in common-sense and experience, applied to the facts of individual cases and groups of cases. The true physician is not a sectary; he disowns all artificial formulas of cure, exactly as he disowns homeopathy; and he especially disowns the nickname of *allopathist*, invented for him by Hahnemann. His belief in remedies is not founded on extreme generalizations, and he refuses to be limited in his practice by any other technical rules than those derived from a fair view of facts investigated on the ordinary principles of positive science. It is very certain that Hahnemann's alleged "provings" have been rejected as in great part visionary by the great majority of those who have attempted to ascertain personally the effect of the same remedies; and it is equally certain that Hahnemann himself admits the general aggravation of diseases by homeopathic doses when administered in sensible quantities, and that the system of infinitesimal doses was with him simply a last refuge from the contradictory character of the results obtained under the earlier trials of remedies devised according to his assumed principle. The argument of physicians in general has been that the principle was false, and that the infinitesimal doses are its *reductio ad absurdum*. They admit freely that homeopathy has in some instances done good, by illustrating the spontaneous cure of disease, and correcting a blind faith in heroic remedies; but although individual converts of some local credit have here and there been made, there is not the slightest appearance of a movement in the profession towards adopting homeopathy as a system, and its much-vaunted statistics are generally regarded as extremely fallacious.

HOMEOP'ATHY (*ante*) was introduced into the United States in 1825 by Hans B. Gram, a native of Boston, educated in Denmark. Eminent physicians of the old school, after careful study and observation, gave it their adherence. It was adopted in other places, and the practice has grown steadily to the present time, when there are in the country probably not less than 7,000 physicians of this school; 10 or 12 homeopathic colleges, graduating annually from 200 to 300 students; 40 homeopathic dispensaries; more than 30 homeopathic hospitals; and 15 periodicals devoted to the system. Its literature embraces works by men eminent for learning and ability. While homeopathic physicians agree in accepting the fundamental teachings of the system, there is considerable diversity of practice among them in regard to detail, especially as to the use of high attenuations.

HO'MER, the greatest name in the history of epic poetry, and who stands as high in that department as Shakespeare does in the drama, has come down to us in modern times unfortunately as little better than a name, and presents materials for biography as scanty as those which he offers for criticism are rich. We are not, however, forced to go to such lengths of doubt in his case as Aristotle did in the case of Orpheus, denying that such a man ever existed; for though the Germans, since the days of Heyne, Wolf, and Niebuhr, have indulged themselves in every variety of historical skepticism, and reduced Homer, as well as Cadmus and Hercules, to mere "symbols," the more sober genius of British criticism, with which the moderate views of the best later Germans coincide, has pronounced an almost unanimous verdict in favor of the historical reality of the author of the *Iliad* and the *Odyssey*. Not that any reliance is to be placed on the details of the old Greek lives of Homer, which are manifestly fictitious; but the internal evidence of the poems themselves leads to the belief in an authorship such as agrees substantially with the kernel from which these very ancient legendary traditions were developed. The central fact in which all these traditions agree is that the author of these poems was an Asiatic Greek; and though other places are named, the greatest amount of legendary evidence clearly points to Smyrna as the city which had the honor of giving birth to the father of epic poetry. The dialect in which the *Iliad* and *Odyssey* are written—the Ionic—is the very variety of Greek which was afterwards used in the same region by Herodotus, the father of history, and by Hippocrates, the first and greatest of Greek physicians; and the allusions to natural phenomena, especially the fre-

quent mention of the strong n.w. wind blowing from Thrace, plainly indicate the w. coast of Asia Minor as the familiar residence of the poet. The chronology of the Homeric poems, both as respects the great central event which they celebrate—the Trojan war—and the age of the poet himself, is much more doubtful; but it is quite certain that Homer lived considerably before the recognition of a regularly received record of dates among the Greeks—that is, before the year 776 B.C., the commencement of the calculation by Olympiads. The date given by Herodotus for the age of Homer—400 years before his own time; that is, about 850 B.C.—is probable enough; but considering the entire want of any reliable foundation for chronology in those early times, we must not seek an accuracy in this matter beyond that which was attained by the Greeks themselves, and allow a free margin of at least 200 years from the time of Solomon (1000 B.C.) downwards, during which the singer of the *Iliad* and *Odyssey* may have flourished. To throw him further back than the earliest of these dates would be inconsistent at once with the historical elements in the midst of which his poems move, and with the style of the language which he uses; for this exhibits a luxurious freedom, a rich polish, and an exquisite euphony, which remove it far from that roughness and clumsiness which is wont to characterize languages in their earliest stage of literary development. The Ionic dialect used by Homer is, in fact, a highly cultivated shoot of the old Hellenic stock, and which was in the poet's hands so perfect for the highest poetical purposes as to have remained the model for the epic style during the whole period of the poetical literature of the Greeks.

In endeavoring to form a correct estimate of the position of Homer as a poet, the primary fact from which we must start is that he was not the epic poet of a literary age—like Virgil among the Romans, Tasso among the Italians, or Milton among ourselves—but he was decidedly and characteristically an *aoidos*, or *minstrel*, a character well known to us from our own mediæval literature, both in other shapes, and specially as it has been presented to us by the kindred genius of sir Walter Scott. That there is an essential and vital generic distinction between the popular minstrel of an age when books are either not known or little used, and the cultivated poet of an age which rejoices in all sorts of libraries, and possesses a special class of literary readers, admits of no doubt. The conditions of the work to be done being different, the work itself cannot possibly be the same. It is quite certain, however, that the great majority of the critics and translators of Homer in this country have not recognized this distinction. The consequence is that they strike an entirely false note, and blow the seraphic trump of Milton when they should be content to take a plain shepherd's pipe in their hands. These critics and translators are no doubt actuated by the very noble desire of redeeming the author of two such noble poems as the *Iliad* and the *Odyssey* from the vulgar fellowship of wandering minstrels and ballad-mongers; but however high the genius of Homer unquestionably soared above the best of the mediæval ballads to which the English ear is accustomed, it is quite certain both that the materials out of which his great poems were composed were nothing but such popular ballads and tales as delighted our forefathers before the invention of printing, and that the spirit and tone of the Homeric epos is distinguished from that of the literary epos or epos of culture precisely by those characteristics which distinguish our old ballads from the poetry of Wordsworth and Tennyson. Of modern poets, the one who possessed the greatest relationship to the genuine old minstrel poets was sir Walter Scott; but even in his poetry many peculiarities can be pointed out which mark the literary writer of a later age, as distinguished from the popular singer of a people's boyhood and lusty youth. In order to understand Homer, therefore, we must look on him as the culmination of the minstrel or ballad poetry, in the shape of the minstrel epos; a grand combination of popular ballad materials and ballad tone, elevated to the highest pitch of which it is capable, with the architectural form and structure of the epos. To the recognition of this true character of the Homeric poems, the present age has been led mainly by the adventurous and suggestive criticism of the celebrated scholar, Frederick Augustus Wolf. This distinguished German, originally a professor in Halle, afterwards in Berlin, published in the year 1795 the *prolegomena* to a new recension of the text of Homer, in which he maintained the extreme skeptical view already alluded to, according to which the *Iliad* is no proper epic poem in the sense that the *Æneid* and *Paradise Lost* are so, but only a skillful compilation of popular ballads, originally separate, and of whose separate existence the sharp-eyed critic can now easily adduce satisfactory proof. Now, this theory, commonly called after its author, the Wolfian theory, and which has found, and still finds, not a few most ingenious supporters in Germany, contains an important element of truth, which has too often been summarily rejected, along with the error which it promulgates. It is not credible that poems pervaded by such a wonderful unity of tone and plan as the *Iliad*, manifestly also inspired by a genius of the highest order, should be resolvable into the mere patchwork of skillful compilers; but it is an important truth to announce that the materials of Homer's poetry were not invented by himself, but taken up from the living traditions of the people to whom he belonged, and that even in the grand unity to which his genius has subjected them, their original popular tone and spirit is preserved in a fashion which characteristically distinguishes them from all epic poetry of the literary ages. There can be no doubt that the merits of Wolf in this regard will soon be as universally recognized in every other country as they have long

been in Germany; but, in the mean time, it is to be lamented that of those who have written most largely on the subject, neither col. Mure nor Mr. Gladstone has been able to exhibit to English readers the true golden mean in this matter between the extravagance of the ultra-Wolfians and the falsetto of the anti-Wolfian critics and translators. Among the Germans, Welcker, Nitsch, and K. O. Müller may be named as presenting the best models of judicious and well-balanced criticism in this slippery domain.

The characteristics of Homer's poetry, as the culmination of ballad poetry and the grand model of the minstrel epos, may be expressed in a very few words. In the first place, the materials are essentially national, and if not strictly historical in every detail of decoration, grow, like all ballad poetry, out of the real life of the people, and rest at least upon an honest historical substratum. In this view, the *Iliad* is as valuable for the earliest history of the Hellenic race as Herodotus and Thucydides are for the later periods. But it is not for the Greeks alone that Homer possesses an important historical value; he is for all ages an important record of the earliest stages of human society, second only to the books of Moses and perhaps some of the very oldest of the Vedas. The first germs of almost all other arts and sciences afterwards cultivated by the Greeks and Romans are to be found in Homer. In this view, he was to the Greeks themselves an encyclopædia of their national culture; and, as embodying the grand features of their polytheistic faith, he is also constantly quoted by their great writers with all the deference due to a Bible.

The poems of Homer, as a great human inheritance, have naturally been incorporated, by translation, into all the languages of Europe. In Italian, the translations of Cesarotti and Monti; in French, that of Montbel; in German, that of Voss, are the most famous. In England we have tried this great problem in the most various styles, and have produced specimens of brilliant success in certain partial aspects. The whole excellences of Homer have not yet been exhibited in any one of the notable English translations, nor is such a combination perhaps possible. The grand flow, rapid march, and sonorous fullness of the original are well given by Pope; the rough dramatic vigor of individual phrases and passages are best rendered by Chapman; while the unaffected truthfulness and easy, unpretending grace which so prominently mark the great Smyrnean minstrel appear most clearly in Cowper. Of the recent attempts which have been made, and are making, to present Homer in some new aspect to English readers, it is premature to speak. We may mention the translations of Newman (1856), Worsley (1861–65), Dean Alford (1861), Sincox (1865), lord Derby (1865), John Stuart Blackie (1866), Herschel (1866), Merivale (1869), and W. C. Bryant (1870–71).

Those who wish to enter more minutely into the various questions connected with Homer and the Homeric poems may consult the works on Greek literature by col. Mure and K. O. Müller; the special work on Homer by Mr. Gladstone; the article "Homer" in Dr. Smith's *Dictionary of Ancient Biography;* and the article "Homer" in the *Encyclopædia Britannica.*

HOMER, a t. and village in Cortland co., N. Y., on the Syracuse and Binghamton railroad, 27 m. s. of Syracuse; pop. of t., 3,657. In the village are several churches and a number of manufactories.

HOME RULE. The title chosen to define the object of a political organization in Ireland, and of the party in the British parliament representing that organization. The discouragement among the extreme Irish agitators which followed the suppression of the Fenian rising in 1867 opened the way for those who favored more constitutional methods of asserting the claims of the Irish people. The disestablishment of the church inclined many Protestant conservatives to co-operate with politicians of this stamp. At a meeting held in the Bilton hotel, Dublin, on May 19, 1870, presided over by the lord-mayor, a Protestant conservative, and attended by prominent conservatives, Orangemen, Catholic liberals, nationalists, repealers, and Fenians, a resolution was adopted "that the true remedy for the evils in Ireland is the establishment of an Irish parliament with full control over our domestic affairs." An organization entitled "The Home Government Association of Ireland" was formed, the object of which was stated in the rules to be to obtain for the country the right of managing its own affairs by a parliament assembled in Ireland, which should legislate for and regulate all matters relating to the internal affairs of Ireland, and have control over Irish resources and revenues, subject to the obligation of contributing a just proportion of the imperial expenditure. Such matters as the adjustment of relations with foreign states, colonies, and dependencies, and the defense of the empire, were to be left to the imperial legislature; and the new adjustment of the relations between the two countries was to be attained "without any interference with the prerogatives of the crown, or any disturbance of the principles of the constitution." This programme, according to those who put it forth, was at once less and more than the repeal which O'Connell had demanded. It implied a surrender of any Irish claim to control imperial supplies, but demanded a responsible Irish administration. Mr. Butt, q.c., who had become popular through his exertions in defense of the Fenian conspirators, and who had since been president of the amnesty association, took the lead of the new movement, which showed its strength in 1871 by carrying its candidates at by-elections for Meath, Galway, and Westmeath counties, and for Limerick borough, where Mr. Butt was returned unopposed. In 1872

the association continued to gain influence, and adopted "Home Rule" as its watch-word. In Nov., 1873, a national conference was held in Dublin: it was attended by 900 delegates from all parts of Ireland. The home government association was dissolved, and a new organization, entitled the home-rule league, which took its place, adopted the programme of the older body without important alteration. At the general election in Feb., 1874, the home rulers carried 60 seats. In the following month the movement first asserted itself in parliament. Mr. Butt moved an amendment to the address expressing dissatisfaction with the existing system of government in Ireland. In his speech he defined home rule as leaving the management of all exclusively Irish affairs to an Irish parliament, and he asked that constitutional self-government should be conceded to his country. The amendment was rejected by 314 to 50. In the three following sessions a motion for a committee to inquire into the causes of Irish discontent was brought forward, but on each occasion defeated by a large majority. Symptoms of disagreement soon appeared in the home-rule party itself. Mr. Butt favored a policy of incessantly proposing reforms in the details of Irish legislation, while also urging on parliament the general objects of the party. The more extreme section, of which maj. Nolan and Mr. C. S. Parnell soon came to be recognized as leaders, regarded this as too moderate a plan of campaign, and devoted themselves to the task of rendering the imperial parliament unable to discharge its functions by the dexterous use of the method of obstruction. Stormy conferences of the home-rule league were held in Dublin in 1876 and subsequently. Mr. Butt nominally retained the leadership, but it was evident that a strong section of the party approved Mr. Parnell's tactics, and by the beginning of 1878 the control of parliamentary action and of the movement generally had passed out of the hands of Mr. Butt, whose death, early in 1879, may be said to have marked the close of the original and more moderate phase of the home-rule agitation.

HOME RULE FOR IRELAND. How to rule Ireland peaceably and well has been a problem ever since its annexation. Irish agitations have passed into a by-word, and as many schemes have been propounded for the amelioration of the condition of the country as would number the years of British rule. The Fenian outbreak (1864) led to so much suffering for all classes, and entailed such misery upon many utterly innocent of its principles, that the attention of the ablest men in the distracted country was directed to some project which, while leaving Ireland substantially under the British rule, should secure for it free legislation in matters of internal interest. Hence arose the home-rule league, first suggested by the able and far-seeing Isaac Butt, member for Dublin, and for many years controlled by him and largely influenced by John Francis Maguire, M.P. for Cork. Its professed object was to declare the right of the Irish people to self-government, and to establish the principles of a federal arrangement, by which the right of legislating for and regulating all matters relating to the internal affairs of the country should be secured to an Irish parliament, consisting of an equal number of Protestants and Roman Catholics, leaving to the imperial parliament all questions affecting the imperial crown in its relation to other countries, and, in short, all and everything pertaining to the defense and protection of the empire at large. Mr. Butt advocated a government for Ireland as a constituency of Great Britain, such as obtains in the United States, where each individual state is self-governed and yet represented in the national congress. In 1871 Isaac Butt was returned as member for Limerick, and two years later the first convention of the home-rule league was held in Dublin. At the succeeding election (1874) its popularity was demonstrated, 60 members from Ireland being returned upon its merits, and 28 in England solemnly engaging to support it; nevertheless a motion in the houses in its favor was defeated by 314 to 52, and, in the following year, Mr. Butt's motion for a committee on the subject was negatived three several times. A stormy convention was held at Dublin in 1877, which was followed by increased activity on the part of the home-rule members in the houses, Mr. Butt still being the chosen leader of the party. In 1878 he resigned, and the principles of the home-rule party having undergone a change, it has lately become apparent that their ultimate object is the establishment of an Irish parliament in which four-fifths of the members will be Roman Catholics.

HOMESTEAD LAWS, laws enacted by a majority of the states composing the American union, exempting a homestead of greater or less value from attachment for debt, and reserving the same for the benefit of the owner's family. The laws of the several states making such a provision are exceedingly various both as to the value of the estate reserved, the circumstances and conditions under which the exemption takes place, and the ways in which it is brought to a termination. The value of an exempted homestead in some states is limited to $300, in others to $500, in others to $1000, in others to $1500, in others to $2,000, in others to $3,000, and in others still to $5,000. The homestead laws have been enacted within the last fifty years, in order to remove the hardships of the common law as respects wives and children. They impose a limitation on the power of a husband and father to distress his family by alienating the estate which he may have received in whole or in part from his wife, or of which he has become possessed in part by her labors and sacrifices. It is held to be sound public policy to guard the homes of the people from seizure and sale at the pleasure of creditors, as well as from a too easy

alienation by husbands and fathers. The practical effect of these laws has served to commend them to general favor, and they are likely to be permanent. It is not improbable that they may even undergo some modifications with a view to the more effectual protection of the rights and interests of women and children.

HOM'ICIDAL MA'NIA. This is the *monomanie meurtrière* of the French. There is developed, under certain morbid conditions, a blind, irresistible tendency to destroy life. It is independent of hatred, or any appreciable incentive; and even acts in opposition to the general disposition, the interests, and the affections of the perpetrator. Dr. Otto of Copenhagen has recorded a series of motiveless murders. Georget gives the case of M. N., who was silent and solitary, but reasonable, and confessed a desire to shed blood, and particularly that of his mother and sister by poniard. He deplored the dreadful tendency, for he loved them both tenderly. Yet the fit returned, and he cried out: "Mother, save thyself, or I will cut your throat!" The victim selected is most frequently a child, a wife, a benefactor, or an object of love and respect. Hoffbauer, in Germany; Esquirol, Marc, Foville, in France; and Conolly, in Britain, have all demonstrated, and in criminal courts have testified to, the existence of this form of mental disease and ground of irresponsibility; but no recognition has been obtained of the irresistible, motiveless homicidal tendency as a bar to trial or to punishment. The impulse, however, is manifested in a more complicated form. It may originate in delusions; and the act which first reveals the mental condition may be committed in supposed self-defense, or to secure the salvation or prevent the suffering of the individual destroyed. Such manifestation may constitute the characteristic symptom of furious madness, where the excited maniac sacrifices all around, or all who resist his course, under the instigation of the predominating passion, or of melancholia and despondency. There occur periods when the tendency to shed blood becomes epidemic or imitative. There is in many natures an ill-defined satisfaction on hearing of slaughter, wars, and atrocities; and such details, or the sight of blood, are said to be suggestive of this tendency. Marc states that six cases of infanticide followed immediately upon the publication of the trial and history of Henriette Cornier, who cut off the head of her child. The puerperal condition, various hereditary tendencies, powerful moral impressions, and atmospherical influences are conceived to induce this tendency. The proximate cause is generally found to consist in marked organic changes in the nervous system, such as are detectable in epilepsy; or in the more insidious and obscure structural alterations which are supposed to accompany perverted and depraved instincts; although homicidal mania may occur independently of either of these pathological conditions.

Esquirol, *Des Maladies Mentales*, t. ii. p. 115; Marc, *De la Folie*, etc., t. ii. p. 24; Yellowlees, *Homicidal Mania*, *Edinburgh Medical Journal*, Aug., 1862.

HOM'ICIDE, a term used in English law to denote the mere killing of a human being without implying the attendant criminal responsibility. It is used with the word *justifiable*, to denote that the killing was done under lawful authority, as hanging a man or killing a prisoner to prevent him escaping, or killing one to prevent an atrocious crime being committed. *Excusable homicide* means killing in self-defense, or in defense of a wife, child, parent, or servant, or property, or by mere accident. *Felonious homicide* includes murder of one's self or of another; and *manslaughter* is killing without malice, but attended with negligence, hot blood, or in some unlawful way. In Scotland excusable homicide is generally called culpable homicide.

HOMICIDE (*ante*), the killing of one human being by another either innocently or feloniously. To say that there has been a homicide does not necessarily imply that a crime has been committed; for, though every murder is a homicide, every homicide is not a murder. The law permits a man to kill another in self-defense when his own life is assailed or threatened; but the danger must be real, or in good faith and for sound reasons deemed so by the person threatened. A man may lawfully kill another, after due warning, in defense of his property, or to prevent the escape of one who has committed a felony. An officer of justice charged with the duty of arresting a criminal or with the performance of any other lawful act may kill a person who resists or attempts to thwart him by force. A person charged with felony, seeking to escape after arrest or fleeing to avoid capture, may be lawfully killed by an officer if he cannot otherwise be taken. A man engaged in committing a felony may be lawfully killed by an eye-witness if there be no other way of preventing the crime. The keeper of a prison may, if necessary, prevent the escape of a prisoner by taking his life. In all such cases, however, it must appear that the killing was resorted to as a last alternative. Justifiable homicide is the term applied in law to all such cases. Where one kills another by accident, without any intention to do him injury, and while exercising a proper degree of caution, the law deems it an excusable homicide; as, for example, when a man driving in the highway in the darkness runs over and kills another without knowing it, or, discovering the danger, has yet no time or power to avert the calamity. The line between justifiable and excusable homicide is vague and, in a legal sense, not important, since neither the one nor the other exposes a man to punishment. In some of the states of the union no distinction is made between them. See MURDER, *ante*.

HOM'ILDON, BATTLE OF. In the autumn of 1402 a Scottish army of about 10,000 men invaded England, under the command of sir Murdach Stewart of Kincleven, the

eldest son of the regent Albany, and of Archibald earl of Douglas. They advanced to the gates of Newcastle without opposition, and were returning to Scotland laden with spoil, when they were encountered by an English force under the earl of Northumberland, his son Hotspur, and the exiled earl of March or Dunbar. The Scots took up their position on Homildon Hill, near Wooler. On Sept. 14 Hotspur was advancing to charge them, when he was stopped by the earl of March until the English archers should do their work. Their shafts were poured with such effect that, in the words of a contemporary chronicler, they bristled in the dense ranks of the Scottish army like quills upon a hedgehog. At length a gallant knight, sir John Swinton, cried out: "Brave fellow-countrymen! what has this day bewitched you that you stand here to be shot like deer in a park, instead of proving your courage, as of old, by meeting your foemen hand to hand? Let those who will rush, rush down with me, in the Lord's name, upon the enemy, and either save our lives or fall with honor." At these words, Adam of Gordon, who was at mortal feud with Swinton, sprang forward, and throwing himself on his knees, besought the honor of knighthood from the warrior, whom he must now look upon as the best knight in Britain. His request was granted; and the two knights, followed by about a hundred retainers, rushed upon the English ranks. They were slain to a man, but not before they had made such slaughter that the English captains were said to have confessed that if all the Scots had fought as well, the day would have had a different issue. As it was, the English had an easy victory, and the Scots were utterly routed. Their leaders were taken prisoners; five of their best knights, with many of their bravest esquires, were slain; and besides the numbers that were killed on the field by the English arrows, about 500 were drowned in attempting to cross the Tweed.

HOMILETICS, that particular branch of sacred rhetoric which regards the composition of the familiar discourses known under the name of homily. The earliest writer on the subject of homiletics is St. Augustine, whose book, *De Doctrina Christiana*, is in some sense an adaptation of profane rhetoric to sacred uses. Rabanus Maurus and Isidore of Seville also incidentally treat the subject; but the nearest approach to a systematic treatment of the subject in mediæval literature is to be found in Hunibert, *De Eruditione Concionatorum*. St. Carlo Borromeo's *Instructiones Pastorum* was a part of his general scheme for the improvement of clerical education; and in the ecclesiastical course, as well of Catholics as of Protestants, homiletics occupies an important place. The bare enumeration of the works of Schott, Marheineke, Theremin, Sailer, Gisbert, Brand, Laberenz, may show the importance which is attached in both churches to this branch of sacred science.

HOMILIARIUM, a collection of homilies for the use of pastors. Such collections were in use from a very early period. Mabillon mentions a very ancient Gallican homiliarium (*De Lit. Gallican.*). The fifty homilies of Venerable Bede, too, were in familiar use among the clergy in all parts of the west, and we find in the letters of the early mediæval time traces of a busy interchange of sermons, original or otherwise, between bishops and clergy, even in distant countries. The supply, however, was imperfect and scanty, and one of the many reformatory measures of Charlemagne was a compilation of homilies under the title of homiliarium, which was made under his direction by the deacon Paul Warnefried. It was compiled in the end of the 8th c., and contains homilies for all the Sundays and festivals of the year. Many synods of that and subsequent periods directed the clergy to translate these sermons for their flocks, and the collection continued in use for this purpose down to the 16th century. It was printed at Speyer in 1482, and again at Cologne in 1557. A collection of homilies is also ascribed to Alcuin, but it seems more likely to have been but a modification of the homiliarium of Warnefried. A collection of English homilies turned into verse, that they might be more readily remembered by the people, appears to have been composed about the middle of the 13th century. This collection, affording a metrical sermon for every Sunday and festival day in the year, exists in MS.; and a portion of it has recently been edited by Mr. Small, librarian to the university of Edinburgh.

HOMILIES OF THE CHURCH OF ENGLAND, a collection of sermons, the first part of which was published in 1547, the first year of the reign of Edward VI., to be read in the churches, partly in order to supply the defect of sermons, but partly, also, to secure uniformity of doctrine, and to guard against the heterodoxies, old and new, which at that time threatened the unconsolidated church. The second part was published in 1562, at the same time with the articles, under Elizabeth. The 35th article declares that "the book of homilies doth contain a godly and wholesome doctrine, and necessary for these times." The titles are enumerated in the article, and are 21 in number. The homilies are not now read in churches; but there is no law to prevent their being so read, and they are frequently appealed to in controversies as to the doctrine of the Anglican church on the points of which they treat. The precise degree of authority due to them is matter of doubt.

HOMILY (Gr. *homilia*, converse) primitively signifies a discourse held with one or more individuals, but in ecclesiastical use it means a discourse held in the church, and addressed by the minister to the congregation. The practice of explaining in a popular form the lessons of Scripture read in the synagogues had prevailed among the Jews,

and appears to have been adopted in the Christian churches from the earliest times. The discourses employed for this purpose were of the most simple character; but with the exception of one ascribed to Hippolytus (q.v.), we have no sample of this form of composition earlier than the homilies of Origen in the 3d century. Taking these as a type, the early Christian homily may be described as a popular exposition of a portion of Scripture, accompanied by moral reflections and exhortations. It differs from the sermon (Gr. *logos*, Lat. *oratio*) in eschewing all oratorical display, and in following the order of the scriptural text or narrative, instead of being thrown into the form of a rhetorical discourse or a didactic essay. The schools of Alexandria and Antioch appear to have been the great centers of this class of sacred literature, and in the early centuries we find the names of Hippolytus, Metrodorus, Clement of Alexandria, Dionysius, and Gregory Thaumaturgus as principally distinguished. But it was in the following centuries that the homily received its full development in the hands of the oriental fathers, Athanasius, the two Gregories, of Nyssa and of Nazianzum, Basil, the two Cyrils, of Jerusalem and of Alexandria, and, above all, Chrysostom; and in the west, of Ambrose, Augustine, Peter Chrysologus, Leo, and Gregory the great. In later centuries, Venerable Bede, the popes Sabinian, Leo II. and III., Adrian I., and the Spanish bishops Isidore of Seville and Ildefonsus continued to use the homiletic form; and even in the modern church many preachers have regarded it as the best medium of scriptural instruction; and two different forms of homily are distinguished, the higher and the lower. The former follows the order of matter, rather than of any scriptural passages assumed to be expounded; the latter is a purely exegetical and moral exposition of some lesson from the liturgy, or of some other extract from holy Scripture.

It is right to add, however, that this strictly historical acceptation of the name homily is by no means uniformly observed in modern use. The name homily is very frequently used, almost as a synonym for sermon, and signifies nothing more than a plain, moral discourse, without ornament or rhetorical pretension, but also without any pretension of being molded upon the ancient patristical model.

HOM'INE REPLEGIAN'DO, an old writ in English law, meaning to bail a man out of prison; now disused.

HOMIN'IDÆ (from *homo*, and meaning "man family"). Some naturalists place man in the same order with the QUADRUMANA, classifying him in the subordinate position of a family. To this family they have given the name *hominidæ*, of the order PRIMATES, which includes the apes and monkeys. Certain structural affinities are offered as grounds for this classification, but many naturalists reject the reasons, and maintain, with prof. Owen, that "man is the sole species of his genus, the sole representative of his order." The generally adopted classification is that which includes man with the type or branch of VERTEBRATES and class MAMMALIA. So far, it is allowed, the analogy holds good between man and certain lower orders of animals; but when we come to divide the great class of mammals into orders, it is held that there are certain distinguishing characteristics which separate man from all the rest. The nearest approach to him is in the apes, but these animals are all four-handed, and it is contended that they have nothing which can be regarded as at all parallel with the foot of the perfectly erect-standing man, and that their whole organization is totally unfitted for that posture. Naturalists have, therefore, usually given man an order by himself, the order BIMANA, and in this he has been grouped into different races and varieties; but any division into genera, under this order, is of course inadmissible. See BIMANA and MAN, *ante*.

HOMOCERCAL. See HETEROCERCAL, *ante*.

HOMOGANGLIA'TA (Gr. *homos*, the same, and *ganglion*, a ganglion), the name given by Owen to the *articulata* of Cuvier, in accordance with a belief in the great importance of the nervous system as a basis of zoological classification. Each segment in the lowest homogangliata contains a pair of ganglia with nerves proceeding from them; all, however, communicating by nervous filaments, and constituting a continuous chain. In the higher forms there is a greater concentration, and a more evident allotment of the ganglia of particular segments to particular functions.

HOMOLOGA'TION, a Scotch law-term, denoting an act or conduct which confirms or approves of something which otherwise might be invalid. Thus, an informal deed, though useless in itself, yet, if acted on by one or both parties, will be set up and made valid, as against the party homologating. To constitute homologation, a clear knowledge of what the party is doing is necessary. The term is not used in English law, but similar effects are produced, and bear other names, such as confirmation, estoppel, part performance.

HOMOL'OGOUS quantities or magnitudes in geometry are such as correspond, or are like to one another. For example, in similar triangles, the homologous sides are those which are opposite to corresponding angles. See HOMOLOGY.

HOMOL'OGY, in anatomy, is the term now used to indicate structural correspondence, while the term *analogy* is employed to indicate functional resemblance. Thus, by homologue is implied "the same organ in different animals, under every variety of form and function;" while by analogue we understand "a part or organ in one animal which has the same functions as another part or organ in a different animal." For example, the

wings of an insect are the analogues of those of a bat or bird, but not the homologues; whilst the latter are homologues with the arms of man, the fore-legs of quadrupeds, and the pectoral fins of fishes. For further illustration, see Owen *On the Archetype and Homologues of the Skeleton.*

HOMOLOGY, in chemistry, is used to express agreement of composition or structure in organic bodies. See BOILING OF LIQUIDS: under which title the tables—given to show the differences of boiling points corresponding to differences in the chemical structure of certain liquids—are tables of homologous alcohols and acids. The members of the homologous series differ by the addition or subtraction of certain organic radicals.

HOMŒOPATHY. See HOMEOPATHY.

HOMOOU'SIAN (Gr. *homos*, the same, and *ousia*, substance), and HOMOIOUSIAN (Gr. *homoios*, like, and *ousia*, substance), two terms that long distracted the primitive church. The first was the shibboleth of orthodoxy in the Arian controversy, the decree of the council of Nice, which declared the Son to be *homoousian*, of the same substance with the Father. The rigid Arians, who resisted the decree of Nice, of course rejected the term. The semi-Arians, who held the subordination of the Son to the Father, were divided as to its use. Some of them rejected the word altogether, as directly conveying a false idea; others, while they did not absolutely reject the idea, regarded the word as objectionable, but rather as susceptible of misinterpretation than as absolutely false. Both parties argued against its use from a decree of the council held at Antioch in the year 269, against Paul of Samosata, in which the name homoousian, as applied to the Son, was expressly condemned. They contended, therefore, that the fathers of Nice had erred in applying it, and they proposed to substitute for it the term *homoiousian* (of a like, i.e., a similar but not identical substance with the Father). Without entering into the doctrinal controversy, it will suffice to say that the term, as used by the council of Antioch, bore a very different signification from that which the fathers of Nice attached to it. In the controversy with Paul of Samosata, who, with the Sabellians, held that the Father and the Son have but one and the same person, the word *ousia* was employed to signify personality. Hence, when the council condemned the doctrine of Paul, that the Son is homoousian with the Father, it merely declared that the Father and the Son are not one and the same person. On the contrary, the council of Nice, in defining that the Father and Son are homoousian, understand *ousia* in the very different signification of substance or nature. See the historical treatises of Athanasius, Newman's translation.

HOMOP'TERA (Gr. *homos*, the same, uniform, and *pteron*, a wing), according to some entomologists, an order of insects; according to others, one of the two great divisions of the order *hemiptera* (q.v.), differing from the *heteroptera* in having the first pair of wings of uniform substance throughout (whether perfectly membranous or somewhat leathery, and so passing into elytra), and the rostrum or sucker originating from the inferior part of the head near the thorax, or even between the first pair of legs. The homoptera feed on the juices of plants, and some of them are very troublesome to farmers and gardeners. The females of many have an *ovipositor*, by means of which they pierce plants in order to make a place for the reception of their eggs. The larvæ are active, and resemble the perfect insect, but are wingless. The pupæ are also active, and have rudimentary wings. Among the homoptera are cicadas, the largest of the order, lantern-flies, froth-hoppers, aphides, and the coccus tribe.

HOMPESCH, FERDINAND VON, 1744–1803; b. Germany, of a noble Prussian family. At 12 years of age he went to Malta in the capacity of page to Rohan, grand-master of the knights of St. John, and rapidly rose to position in the order, and became the last grand-master. The seizure of Malta by Bonaparte in 1798 induced Hompesch to resign his mastership to the czar of Russia, who granted him a pension. He died in France in very poor circumstances.

HOMS, or HUMS. See HEMS, *ante.*

HONAN', one of the central provinces of China, having an area of 66,900 sq.m. and a population of 29,069,771. Its capital, Kaifung-fu, is situated on the Yellow river, from which it has often suffered, the river-bed being here elevated above the adjacent country. It has been overflowed nineteen times. In the reign of Fuhi (2852 B C.) it was the capital of China. It has suffered various vicissitudes. In the 12th c. of our era it was six leagues in circumference. At present the city is uninteresting to Europeans, save as the residence of the Jews of China, now dwindled to a few families.

HONAWAR', a seaport on the Malabar or w. coast of the peninsula of Hindustan, is a t. in the district of Kanara (north) or Honawar, in the presidency of Bombay. It is in lat. 14° 17′ n. and long. 74° 30′ e., being 340 m. to the s.e. of Bombay. It stands on the n. side of an inlet of the Arabian sea, which receives the Gerseppa or Sheravatti from the western Ghauts. Though both the harbor and the anchorage outside have a good bottom and a sufficient depth, yet, in the season of the s.w. monsoon, the surf is a serious impediment to navigation. Pop. '72, 5,191.

HONDEKOETER, MELCHIOR, 1636–95; a Dutch animal-painter. His father and grandfather had both made a considerable name in that walk of art, but their fame was

soon eclipsed by his. Though he painted every kind of animal, his favorite subjects were cocks, hens, ducks, and peacocks, which he delineated with wonderful correctness and truth. It is said that he trained a cock to stand in whatever attitude he desired, and to remain in that position for several hours at a time without moving a muscle. The landscapes which he introduced as backgrounds to his pictures were equally true to nature, and finished with a delicate lightness and transparency of touch that harmonized admirably with the subject of the piece. In his special line he is still unrivaled, and his pictures, of which the best are in English collections, command high prices.

HONDO. From *hon*, main, chief, and *do*, continent or island, the name of the chief island of the empire of Japan; often, but incorrectly, called Nippon or Nihon. Nippon is not the name of any one island, but of the entire Japanese empire. In ancient times the Japanese had no need to give a special designation to their largest island, since they divided their country not into islands, but into *do* or circuits, in which insular boundaries were ignored (see JAPAN); just as we say "middle states," "western states," etc. Of late years the Japanese, studying geography in the western fashion, and seeing the necessity of a name for their chief island, have called it Hondo. (See the excellent geography issued by the Japanese war department, 1874, with accompanying copperplate map of Japan.) The application of the erroneous name Nippon (incorrectly spelled Nipon or Niphon) to the chief island originated with Kampfer, the Jesuits who wrote previously to him knowing Japanese geography too well to use the misleading term. Hondo contains an area officially computed in 1874, at 87,425 sq.m., with a population, by census of 1874, of 25,166,531. It comprises the circuits of Tokaido, Kinai, Tozando, Hokurikudo, Sanindo, Sanyodo, and one province of Nankaido. Its shape is a crescent, with horns toward Asia. A remarkable difference in climate is noted between the eastern and the western halves of Hondo, the former under the influence of the Kuro Shiwo, or gulf stream of the Pacific, being mild and warm; the latter, receiving the cold winds and under the influence of cold currents, having a severer climate. The promontories of Hondo are now dotted with well-equipped lighthouses.

HONDURAS, a republican state of Central America, extending e. and w. from the Caribbean sea to the Pacific ocean, and separating Nicaragua on the s.e. from Guatemala on the n.w. It stretches in n. lat. between 13° 10′ and 16°, and in w. long. between 83° and 89° 45′, containing about 47,068 sq.m., including a portion of the Mosquito territory, and 351,700 inhabitants, most of them wholly or partly of aboriginal blood. The country is generally mountainous, being traversed by the Cordilleras (q.v.), which connect the Andes on the s. with the Sierra Madre on the north. The principal rivers are the Chamelicon, Ulua, Aguan, and Choluteca. An excellent agricultural country, Honduras abounds also in mineral wealth. The minerals are gold, silver, copper, iron, cinnabar, zinc, antimony, tin, platinum, opal, amethysts, asbestos, chalk, limestone, marble, and coal. The soil produces valuable timber, fruit-trees, cotton, sugar, coffee, tobacco, indigo, maize, wheat, potatoes, yams, plantains, bananas, and beans. The foreign trade is carried on chiefly with Great Britain, the United States, and Spain. The annual value of exports, consisting of timber, tobacco, hides, dyestuffs, etc., may be estimated at 1,230,000 dollars, or £246,000. The imports, amounting to 750,000 dollars, or £149,000, consist to the extent of more than one-half of cotton manufactures—the articles next in order being woolens, silks, and wines and spirits. This republic is for administrative purposes divided into the seven departments—Comayagua, Tejucigalpa, Choluteca, Santa Barbara, Gracias, Goro, and Olancho. The revenue amounts to about £97,000. The expenditure has for several years exceeded the revenue, while loans have been raised to construct an interoceanic railway from Port Cortez, on the Atlantic, to the bay of Fonseca, on the Pacific ocean. Of the entire length of 232 m. only 56 m. on the Atlantic side were finished in 1879.

HONDURAS (*ante*). The coast was discovered by Columbus in 1502, and in 1526 the country was invaded and possessed by Cortes, at the head of an army of Europeans and Indians which he brought with him from Mexico. He founded the towns of Trujillo and Puerto Caballos (now Puerto Cortes). Central America soon afterwards fell under the dominion of Spain, Gracias being the seat of government. In 1822 Honduras became a part of the Central American confederation, but asserted its independence in 1839, and for more than twenty years was involved in civil strifes which hindered the development of the country. In 1861 there were attempts at insurrection, instigated by the clergy. These attempts were defeated by president Guardiola, who pardoned all the conspirators and was afterwards assassinated. His successor, Montes, entered into an alliance with San Salvador against Guatemala and Nicaragua, but was defeated in battle, when Medina, one of his own generals, joined the victors and usurped the presidency in 1863. He in turn was deposed in 1872 by Don Celeo Arias, who held the place until Aug., 1875, when Dr. Marco Aurelio Soto was appointed provisional president; and in May of the following year the latter was elected by the unanimous voice of the people as constitutional president for the term of four years. The internecine strifes, and the wars with neighboring republics which preceded his accession to power, had a most disastrous effect upon the country. Industry was prostrated, the schools forsaken, an onerous foreign debt incurred, and the minds of citizens filled

with doubt and apprehension. Since 1876 public confidence has been restored, industry revived, intercourse with other countries extended, highways constructed, bridges erected, and new plans adopted for general education. The public revenue, which under former administrations rarely exceeded $300,000, is now estimated at $800,000 per annum. The population of the country is estimated at 400,000. Tegucigalpa, the capital, has 12,000 inhabitants. The executive power is vested in a president elected for four years, and assisted by a council of state, composed of two ministers appointed by himself, a senator elected by congress, and a judge of the supreme court. The legislature consists of a senate and a chamber of deputies. The judicial power is vested in two chief-justices, one of whom resides at the present, the other at the former capital, and in a district judge for each department. These judges are appointed for life by the government; but the justices of the peace, one for each town, are elected for one year by the municipalities. There is a standing army of 1500 men, and a militia of 20,000. Some years since, a combination of American capitalists was formed to establish a banking, exchange, and commission business at the capital, in order to facilitate commerce between the two countries. A railway from Puerto Cortes, on the Atlantic coast, to San Pedro Susa, a distance of about 90 m., has been constructed. It cost $2,000,000, and it has rolling-stock valued at $500,000. More than 1000 m. of telegraph are in operation in the republic. It was reported not long ago that Honduras and San Salvador were making an arrangement to put all the Central American states into telegraphic communication with each other. There are no official returns of foreign commerce. An extensive fruit-trade is carried on between the Atlantic ports of Honduras and New Orleans, which might be vastly increased by employing steamers instead of sailing-vessels. Fruits are abundant and of exquisite quality in the northern coast-region and adjacent islands. Large numbers of cattle are annually exported to Cuba. Mahogany, tobacco, hides, sarsaparilla, indigo, and other dye-stuffs, are also among the exports. Coarse woolen stuffs and rude utensils for home use are the only articles of manufacture. Bees are numerous and yield large quantities of honey. Fish in great variety inhabit the rivers and lakes and abound on the coasts. Tarantulas, scorpions, and venomous insects of various kinds infest every part of the country. Alligators and lizards are numerous. The rattlesnake and corral are the only venomous serpents. Locusts are often very destructive. The predatory birds are the hawk, the vulture, and the turkey-buzzard. Aquatic birds are numerous. The face of the country is mountainous, the highest elevations being 8,000 ft. above the sea. The rivers are numerous, most of them flowing to the Atlantic. The largest of these rivers is the Ulua, which is navigable for 70 m. for steamers of small draft. The Segovia, which forms a portion of the southern boundary, receives its principal waters from Honduras, and has a course of 350 m. through an unbroken wilderness, over a rocky bed, and is broken by rapids which make navigation impracticable. The soil is extremely fertile, and vegetation is luxuriant. The sugar-cane is indigenous, thriving well at elevations of 4,000 ft. above the sea. Coffee flourishes, and tobacco of the best quality is raised. Pimento, capsicum, and other spices are plentiful. Mahogany and rosewood are found in great abundance, as are also many other valuable cabinet woods. The climate is equable on the highlands, but hot on the Caribbean coast, where miasmatic fevers are common. Mining, once the chief business of the country, is now almost abandoned, on account of the great difficulties in the way of transportation. Silver and gold are abundant, but the mines cannot at present be profitably worked. The wars which ravaged the country for so long a time repelled both immigration and capital. So long as the precious metals can be obtained in great abundance in regions where peace and good government prevail, and where railroads afford the best facilities for transportation, men are not likely to seek them in countries torn by civil war, and where the mule is the only carrying agent. In 1878 the government founded a national college and seminary, both of which are under the direction of American teachers. Schools are to be found in every town and village, and in 1878, 25,000 children were attending them. The religion of the country is Roman Catholic, under the jurisdiction of the bishop of Comayagua. Of the 400,000 inhabitants, 205,000 are mestizos, 184,000 Indians, 5,750 whites (descendants of the early Spanish settlers), and 5,250 negroes.

HONDURAS, Bay of, an inlet of the Caribbean sea, between Yucatan and Guatemala on the w., and Honduras on the south. From the adjacent countries of British Honduras and Yucatan it receives numerous streams, the chief of which is the Balize, and contains several islands. The shore is marked by reefs.

HONDURAS, British. See Balize.

HONE, William, an English author, was b. at Bath, in 1779. He published a number of clever political satires, *Ancient Mysteries Described*, an edition of Strutt's *Sports and Pastimes*, etc.; but is best known by his *Every-Day Book* (1826–27), his *Table Book* (1827–28), and his *Year Book* (1829), three publications which contain much curious and useful information, and which have been more than once imitated. He died at Tottenham in 1842.

HONES, or Whet-Stones, a particular class of stones used for the purpose of sharpening edge-tools, such as knives, scythes, etc. They are usually cut into pieces about a foot in length, and from an inch to two inches thick, and either left square or

rounded, according to their intended uses. The finest kind of hones are those called oil-stones; these are hard, compact, and so very silicious that they readily wear down the hardest steel; they are varieties of slate, derived from the argillaceous schists of the paleozoic period. The best are those brought from Turkey; Bohemia is also celebrated for its hones; and excellent ones are found in Persia, in the Harz mountains, in Styria, in America, Spain, Peru, and in Siberia. In Great Britain several localities yield hone-stones of excellent quality, and none better than the celebrated Water-of-Ayr stone, which is much used for polishing copper-plates, as well as for hones. The Welsh oil-stone or Idwall stone, and the cutler's greenstone, are obtained from Snowdon in Wales; and in the neighborhood of Tavistock the Devonshire oil-stones are procured. The hones used for sharpening scythes, etc., are usually made of coarse-grained sandstone.

HONESDALE, a flourishing borough in the n.e. part of Pennsylvania, U. S., 124 m. n.e. from Harrisburg. It is situated at the confluence of the Lackawaxen and Dyberry creeks, and connected by canal and railway with New York. It is the center of a coal-district. It contains a foundry, tanneries, glass-works, mills, two newspapers, etc. Pop. '70, 2,654.

HONESTY, *Lunaria*, a genus of plants of the natural order *cruciferæ*, of which two species, natives of the s. of Europe, *L. annua* or *biennis* and *L. rediviva*, have long been cultivated in British flower-gardens, partly on account of the beauty of their flowers, and partly of the curious appearance of their large flat seed-pouches (*silicules*). The origin of the English name is doubtful. Some of the older English poets mention the plant as *lunarie*. It was regarded in the days of superstition as possessing extraordinary virtues.

HONEY is secreted by the nectariferous glands of flowers, from whence it is collected by the working or neuter bees, which extract it by means of the proboscis, and pass it into the dilatation of the esophagus, known as the crop or honey-bag. When the animal has arrived at the hive, it disgorges the honey, probably altered by admixture with the secretion of the crop, into the cells of the comb. It is used by the bees as food, but it is its general properties and uses to man that here require notice.

The composition of honey varies somewhat according to the food of the bees, their age, the season, etc. Hybla, a mountain in Sicily, and Hymettus, a mountain in Attica, were in ancient times celebrated for their honey; doubtless in consequence of the wild thyme and other fragrant herbs growing on them. The honey of Narbonne and Chamouni is now held in high estimation for similar reasons; and in this country honey obtained by bees having access to heather has, as is well known, a peculiarly agreeable taste. The substances which have been recognized in honey are sugar of two kinds—one crystallizable and analogous to glucose (q.v.), and the other uncrystallizable, mannite (according to Guibourt); gummy, waxy, coloring and odorous matters; and pollen. The proportion of crystallizable sugar increases with the age of the honey, so as to give it in time a granular character. The best and newest honey is a clear fluid contained in a white comb, while older honey is of a yellowish and even reddish tint.

From the remotest times, honey has been employed as an article of food; and to the ancients, who were unacquainted with sugar, it was of more importance than it now is. "A land flowing with milk and honey" offered the highest conceivable advantages to the eastern mind. Taken in moderate quantity, honey is nutritive and laxative, but dyspeptic persons often find that it aggravates their symptoms. Its therapeutic action is probably not very great, but it is employed with advantage to flavor and give a demulcent character to various drinks or mixtures prescribed for allaying cough; and in the form of *oxymel*, which is usually prepared by mixing honey, acetic acid, and water, it is frequently added to gargles, or mixed with barley-water, so as to form an agreeable cooling drink in febrile and inflammatory affections, or given as an expectorant in coughs and colds.

It should be mentioned that honey occasionally possesses very deleterious properties. Xenophon, in his history of the Retreat of the Ten Thousand (*Anabasis*, book iv.), describes the honey of Trebizond as having produced the effect of temporary madness, or rather drunkenness, on the whole army who ate of it. Mr. Abbot, writing from Trebizond in 1833 to the secretary of the zoological society, observes that he has himself witnessed that the effects of this honey are still precisely the same as those which Xenophon describes, and he adopts the views propounded by Tournefort in 1704, that the poisonous properties are consequent on the bees extracting the honey from the *Azalea Pontica*. Many other instances of poisonous honey are on record.

Honey, although not of so much importance commercially as it was before sugar became so large an importation, is nevertheless brought to this country from abroad in considerable quantities, which, in addition to the home produce mentioned in the article Bee, shows that it is still largely in demand. Nearly fifty tons are annually imported from various parts of the world: North America, the West Indies, Portugal, France, and Greece are the countries from which we receive most. The French is very fine, and is chiefly consumed for domestic and medicinal purposes; the Greek is the finest, and is only used as a table delicacy; most of the other kinds are inferior, and excepting some portion which is used by the tobacco manufacturers, to give a spurious

sweetness to tobacco, it is difficult to account for the consumption of so large a quantity. Honey is often very much adulterated. One of the most common materials used for that purpose is flour; samples of French honey have also been found largely adulterated with gelatine; the latter cannot so easily be detected, as there is always present naturally a portion of gelatine in honey. The quality of even the best depends upon its careful refinement or clarifying. If honey be slightly heated, the chief impurities rise to the surface, and can easily be removed by skimming; this is usually done, except in the case of virgin honey, which is generally sufficiently pure for most purposes.

HONEY ANT, a name given to several species of the ant family, inhabiting Mexico, New Mexico, and Arizona. Like other ants they live in colonies, and most of them have considerable resemblance to our common brown ant. Some of them secrete honey in their abdominal cavities, and become very much swollen, so that they cannot travel. They are then placed in rows in galleries and fed and waited on by the other ants. They become at last apparently spherical distended sacs, the head and thorax having the appearance of a small stem. When food becomes scarce these "stall-fed" ants are eaten by the less-pampered members of the community.

HONEY BUZZARD, or PERN (*pernis*), a genus of *falconidæ*, allied to kites and buzzards, but differing from them, and from all other *falconidæ*, in having the *lore*, or space between the eye and the bill, closely covered with feathers, which overlap one another like scales. The food of honey buzzards consists, not of honey, but chiefly of bees, wasps, and their young, in quest of which these birds dig up the ground, to get at the nests of the insects. They feed also partly on other insects, and less frequently on lizards, small birds, etc. One species (*P. apivorus*) is found in Britain, but is rare; it is rather larger than a common buzzard.

HONEYCOMB MOTH, or WAX MOTH (*galleria*), a genus of small moths of the same tribe with clothes moths, of which some of the species are remarkable for infesting bee-hives. There they deposit their eggs; and the larvæ feed on the honey-comb, through which they make tunnels lined with silk, and in the midst of which they finally spin their cocoons and undergo their transformations. The cocoons are often united in little heaps. These moths, when numerous, are very injurious, and sometimes quite destructive to the bees, from the stings of which they seem to enjoy a perfect immunity. *G. mellonella* or *cereana*, perhaps the most destructive species, is about an inch in extent of wings; *G. alvearia* not much more than half an inch. Both have a satiny appearance, and are amongst the worst enemies the bee-keeper has to encounter.

HONEYCOMBS, in guns, are flaws resembling the cells made by bees, worked in the metal by the action of exploded gunpowder. They spread rapidly, and, with continuous firing, soon eat into the metal to such an extent as to render the further use of the gun dangerous.

HONEY-DEW, a viscid saccharine exudation which is often found in warm dry weather on the leaves and stems of plants, occurring both on trees and herbaceous plants. It is usually but not always associated with the presence of *aphides*, *cocci*, and other insects which feed on the juices of plants, and its flow is ascribed to their punctures; but the rupture of the tissues from any other cause, such as the state of the weather, seems also to produce it, and warm dry weather seems to be necessary for the production in the sap of that superabundance of sugar which is thus thrown off. Aphides themselves exude by certain peculiar organs (see APHIS) drops of a fluid which is called honey-dew, which probably differs considerably from the direct exudation of the plants on which they feed, but mingles with it where they abound. Honey-dew is often so abundant as to fall in drops from one leaf to another on to the ground, sometimes falling from trees even as a copious shower. Different kinds of manna are the dried honey-dew or saccharine exudation of certain plants. See MANNA. But very generally, this exudation, as it dries, coats the surface of leaves and branches with a clammy film, to which everything brought by the atmosphere adheres, and on which molds and other small fungi soon grow, and thus the pores of the plant are clogged and its health is impaired. Gardeners are therefore careful to wash off honey-dew with the syringe. Orange and lemon plantations sometimes suffer great injury from the abundance of honey-dew; and it has proved a cause of very great loss in the coffee-plantations of Ceylon.

HONEY-EATER, or HONEY-SUCKER, a name sometimes given to some of the sun-birds (q.v.), but also the common name of a large family of birds nearly allied to these and to humming-birds, and peculiar to Australia and the islands of that part of the world. This family, *meliphagidæ*—of the order *insessores*, and tribe *tenuirostres*—has a long curved sharp bill, not so slender as in humming-birds and sun-birds; the tongue terminates in a pencil of delicate filaments, the better to adapt it for sucking honey from flowers, or juices from fruits. These are a principal part of the food of the honey-eaters, but they also devour insects in great numbers. They are birds of elegant form, and generally of gay plumage. Most of them have a long and broad tail. They may be observed fluttering and darting among trees and shrubs when in blossom, and are very abundant in all parts of Australia. They are extremely vivacious and active, and keep up a continual chattering. One of the most splendid species, *meliphaga* or *ptiloris para-*

diseus, is called the rifleman or rifle bird by the Australian colonists. Another species, *myzantha melanophrys*, is called the bell bird, because its voice much resembles the tinkling of a little bell. To this family is referred the poe bird, parson bird, or tui-tui (*prosthemodera Novæ-Zeelandiæ*) of New Zealand, a bird larger than a blackbird, and of a deep metallic green color, becoming bronze and black in certain lights, with snow-white tufts of downy curling feathers on the sides of the neck. Unlike most of the *meliphagidæ*, it is a bird of fine song. It has also great powers as a mocking-bird, readily learns to speak many words, and becomes very familiar in domestication.

HONEY-GUIDE, INDICATOR, or MOROC (*indicator*), a genus of birds ranked in the cuckoo family, but differing from the true cuckoos in characters which show an approach to woodpeckers, and also, in some respects, to creepers. They are all natives of Africa, and are found in almost all parts of it. They have acquired their name from guiding men to honey; a curious instinct prompting them to flutter near the traveler with frequent repetitions of a cry which resembles the syllable *cherr;* and it is said that, if followed, they almost always lead to a place where a bees' nest may be found.

HONEY LOCUST TREE, *Gleditschia triacanthos*—also known as the SWEET LOCUST and BLACK LOCUST, and in Britain as the THREE-THORNED ACACIA—a lofty and beautiful tree of the natural order *leguminosæ*, sub-order *cæsalpiniæ*, a native of the valleys of the Alleghanies, and of the basin of the Mississippi. It is not found wild on the Atlantic coast of North America, although often planted for ornament in the vicinity of habitations. The flowers, which are small, greenish, and in spikes, have, when perfect, six stamens and one pistil, but are very generally unisexual. The leaves are twice pinnate, without terminal leaflets, the numerous small leaflets giving a peculiar gracefulness to the foliage, which is of a light shining green. The tree is furnished with numerous sharp triple spines. The pods are long, flat, pendulous, often twisted; the seeds large, brown, and enveloped in a pulp, which, when the pod is ripe, is very sweet. Sugar has been made from it, and, when fermented, it yields an intoxicating beverage, in use among the American Indians. The honey locust attains a height of 70 or 80 feet. Trees of large size are to be seen in some parts of Britain. The wood resembles that of the American locust tree (q.v.), or false acacia (*robinia pseudacacia*), but is more coarse-grained.

HONEY-STONE, or MELLITE, a mineral of remarkable characters and composition, found in connection with coal and sulphur in several places in Germany. It occurs in square octahedrons, looks like a honey-yellow resin, and may be cut with a knife. It is a mellate of alumina, consisting of mellic acid, alumina, and water.

HONEYSUCKLE (*Lonicēra*, or, according to some botanists, *caprifolium*, which others make a sub-genus of *L.*), a genus of plants of the natural order *caprifoliaceæ*. They are shrubs, often twining, and have the flowers either in whorls or in pairs. The calyx is short and 5-toothed; the corolla, tubular-funnel-shaped, 5-cleft, generally two-lipped; the fruit a 3-celled and many-seeded berry.—The COMMON HONEYSUCKLE, or WOODBINE (*L. periclymēnum*), is very abundant in woods and thickets in most parts of Britain. On account of its beautiful cream-colored whorls of flowers and their delicious fragrance, it is often planted in shrubberies, and trained against walls. It is said to be the "twisted eglantine" of Milton. The phenomena observed in its growth have been adduced in proof of a *perceptive power* in plants: the branches shooting out till they become unable to bear their own weight; and then, on their meeting with any other branch, twining around it, from right to left; but if they meet only with one another, twining in different directions, one to the right, and another to the left.—Very similar to this is the PERFOLIATE HONEYSUCKLE (*L. caprifolium*), with paler whorls of flowers, and remarkable for having the upper leaves united so that an opposite pair form one leaf, through the middle of which the stem passes. This peculiarity is confined to the flower-bearing shoots, and does not occur on the young runners; it is also most perfect nearest the flower. This species is a native of the s. of Europe, but now naturalized in many parts of Britain, and much planted, as although less powerfully fragrant than the common honeysuckle, it flowers earlier.—There are numerous other species, natives of Europe, Siberia, and North America.—The FLY HONEYSUCKLE (*L. xylosteum*) is an erect shrub, a native of Europe and Asia, scarcely indigenous in Britain, but common in shrubberies. Its branches are not unfrequently used in some parts of Europe for tubes of tobacco-pipes; and it is said to make good hedges in dry soils. Other erect species are not unfrequently planted in shrubberies.—The TRUMPET HONEYSUCKLE (*L. sempervirens*), called in America the CORAL HONEYSUCKLE, is a native of the southern states of North America, often planted in Britain on account of its beautiful flowers, red on the outside, and scarlet within, which, however, have no fragrance. It is a twining evergreen shrub.—The berries of the honeysuckles are nauseous.—The name honeysuckle is also given to shrubs very different from this genus, but of which the flowers abound in honey, as to species of *banksia* in Australia. *Azalea viscosa* is called swamp honeysuckle in North America.

HONEYSUCKLE, FRENCH. See FRENCH HONEYSUCKLE.

HONEYSUCKLE ORNAMENT, a form characteristic of eastern art. It is used in Assyrian, Persian, and Hindu architecture, and wherever used indicates an eastern

origin. The Greeks borrowed it from the Persians, and, by refining and improving it, made it one of the most beautiful ornaments of their architecture. It is chiefly used in the Ionic style (q.v.). See also GRECIAN ARCHITECTURE.

HONFLEUR, a small t. and seaport of France, in the department of Calvados, is situated on the southern shore of the estuary of the Seine, opposite to and 7 m. distant from the port of Havre. Its situation, backed by wooded heights, is exceedingly pleasing; but it is badly built, dirty, and uninteresting. The commerce of Honfleur, once of some importance, has been absorbed in great measure by Havre; many vessels, however, engaged in the fisheries, are still owned here, and there is a considerable trade in the export of eggs and fruit to England, and in timber. The principal manufactures are hosiery, chemical products, hardware, and refined sugar. There are also rope-walks and ship-building yards. The harbor is furnished with two light-houses. Pop. '72, 8,420.

HONG, the Chinese name for a factory or warehouse kept by foreigners. The word signifies a row or series of shops or rooms. In Canton each block so occupied is known as a "hong," and when about a dozen great traders had the monopoly of the foreign trade they were called "hong merchants."

HONG KONG ("Fragrant Streams"), a British island off the s.e. coast of China, is situated in the estuary of the Chu-Kiang, about 100 m. s.e. of Canton It is 9 m. long, from 2 to 6 broad, and has an area of about 29 sq. miles. The capital, Victoria, is situated in lat. 22° 16½′ n., long. 114° 8½′ east. Pop. '72, 121,985—115,564 of whom were Chinese, 4,931 Europeans and Americans; the remainder, 1490, were Manila men and others of mixed blood. The total public income in 1875 was £186,818; the expenditure, £181,337.

The island is covered to the shore with mountains, the peaks ranging from 1000 to nearly 2,000 ft. high. The mountains consist chiefly of granite, syenite, serpentine, and trap; granite quarries are skillfully worked by the Chinese. In the early years of the colony, when the ground was being broken up for building purposes, European settlers suffered much from febrile and other diseases, and an unenviable reputation for unhealthiness was justly earned. Now, however, in this respect Hong-Kong may compare favorably with any other British possession in the east. For about six months, from May to Oct., the heat is oppressive in the extreme, being accompanied with much rain and damp. During four of the winter months, the weather is cool, dry, bracing, sometimes even cold; but the change from the high and moist temperature of summer to a dry cold is apt to produce dangerous diseases, more especially of the kidneys. The temperature in summer ranges from 83° to 90°, and in winter from 40° to 75°. On the mainland, opposite the northern shore of the island, and separated from it by the harbor, which varies from half a mile to 4 m. in width, is the Kow-loong peninsula, a strip of coast territory and portion of the township of the same name, which was ceded to the British government by the convention of Pekin, Oct. 24, 1861.

Victoria, the capital, is situated on the northern shore of the island, on a small bay surrounded by mountains. It is laid out in magnificent streets and terraces, and has an abundant supply of good water from a large reservoir on the southern side of the island. The harbor is commodious and safe; the roadstead has a depth of from 3 to 7 fathoms, and affords good anchorage. At Aberdeen, on the s. side of the island, and at Kow-loong, there are docks capable of taking in the largest steamers. Between Victoria and Canton and Macao, communication by steam is maintained daily, and since the opening of the Suez canal the same may almost be said of Shanghai, Yokohama, Bombay, Calcutta, and Singapore, so that the magnificent harbor presents a most stirring appearance. In 1875 the total tonnage of vessels entered and cleared amounted to 3,150,200 tons. Here mercantile houses centralize their operations and conduct their money transactions; yet Hong-Kong occupies only a secondary rank in the commerce of China. The bulk of the merchandise from Europe goes direct to the place of its destination, without touching this port; in the same manner, teas and silks pass through Hong-Kong only when it is a port of call for the steamers carrying them. The import trade of Hong-Kong is chiefly in opium, in English cotton and woolen goods, and in metals, in repairing vessels, and in the transfer of passengers. One of the most flourishing of British colonies, Hong-Kong is destined to further extension and importance, and will rise with the gradual increase of the commerce of eastern Asia. A small species of deer is found on the island. Among reptiles there are several species of non-poisonous snakes, one species of the boa which reaches a length of eight or nine feet, and the cobra. Lizards also abound.

In 1843 this island was ceded in perpetuity to her Britannic majesty by the treaty of Nankin, having been occupied as a preliminary measure in 1841. Its affairs are ruled by a governor and legislative council.

HONG-KIANG, or WESTERN RIVER. See SI-KIANG, *ante.*

HONITON, a small market-t. and municipal borough of England, in the co. of Devon, is beautifully situated in a graceful and highly cultivated valley, near the left bank of the Otter, 16 m. n.e. of Exeter. The old church contains a light and elegant oak-screen, erected in 1482 by Courtenay, bishop of Exeter. Honiton has long been

famous for the lace called, from the town in which it is the chief branch of manufacture, "Honiton lace." This lace is made by hand on a *pillow;* its manufacture was introduced into England by the Lollards during the reign of Elizabeth. The vale of Honiton is famous for its butter. Pop. '71, 3,464. Honiton was formerly a parliamentary borough, and returned two members to the house of commons, but it was disfranchised in 1868.

HONOLU'LU, a seaport in lat. 21° 18′ n., and long. 157° 55′ w., on the south-western or leeward coast of Ooahu, one of the Sandwich islands (q.v.), is perhaps the only spot in Polynesia that can fairly claim to be reckoned as an integral part of the world of commerce and civilization. Being the seat of government, as well as the center of trade, it is, in every sense, the metropolis of its own group, which is at once the largest and the most important of all the kindred clusters. But beyond this, its intrinsic advantages, and the absence, or at least the distance, of rivals along the surrounding waters, in any direction, have combined to render it an entrepot between the opposite shores of the Pacific. Besides attracting numbers of whalers for repairs and supplies, Honolulu occupies a most convenient position on each of the three great thoroughfares of its own giant ocean. Though Ooahu, in common with the rest of the chain, is evidently of volcanic formation, yet the reef, which forms the breakwater of the harbor of Honolulu, is of coral formation. The temperature of the town ranges between 67°.9 in Jan., and 83°.2 in Aug.; so that, roughly computed, the annual mean is 75°.55, with a divergence in either direction of only 7°.65. The tropical heat is modified by periodical north-easters. The population, numbering fully 20,000, consists chiefly of natives, the foreign element of it counting about a tenth, and of these a good many are naturalized subjects from the United States of America. Honolulu is visited annually by about 300 vessels of various sizes, many of them being whalers. This mart of traffic has, for seventy years, maintained the unity, and, through the unity, the peace of the once independent and hostile tribes of the Hawaiian archipelago. In Honolulu are to be found consuls from the United States, Chili, Denmark, France, Great Britain, Germany, Russia, Sweden, Italy, Belgium, the Netherlands, Austria, and Peru.

HONOR, ACCEPTANCE FOR, a phrase used in the law of bills of exchange, to denote that a stranger volunteers to accept a bill out of respect to a foreign party issuing the bill to persons in this country, who refuse to accept, in which case the stranger accepting, incurs certain responsibilities.

HONORABLE, RIGHT HONORABLE, AND **MOST HONORABLE;** titles given in the United Kingdom to peers, their families, and persons holding certain public situations. A marquis or marchioness is styled most honorable, a peer (temporal) or peeress of a lower grade, whether by right or by courtesy, is right honorable. The title right honorable is also bestowed on the younger sons of dukes and marquises, and their wives; and on all the daughters of dukes, marquises and earls; and honorable on the younger sons of earls, and all the children of viscounts and barons. Privy councilors, the lords mayor of London, York, and Dublin, the lord advocate of Scotland, and the lord provost of Edinburgh, are also entitled to the prefix right honorable; and maids of honor, lords of session, the supreme judges of England and Ireland, to that of honorable. Members of the house of commons, though honorable is not prefixed to their names, are distinguished as the "honorable member for ——," and the East India company has been held entitled to the same prefix. In America the characteristic love of title has been shown in the practice of attaching honorable to the names of governors of states, judges, members of congress, and other public functionaries.

HONORABLE ORDINARIES, in heraldry. See ORDINARIES.

HONORA'RIUM, a term sometimes used to denote the fees payable to counsel or physicians, because they were presumed to be given as a present, and paid beforehand, and not on the vulgar theory of payment for services rendered. The legal effect which followed was, that neither counsel nor physicians, if not paid their fees beforehand, could bring an action against the client to recover them. This is still the case in the United Kingdom as to counsel, but not as to registered physicians, who can now recover their fees by action. The law as to how far a counsel can validly make a special agreement for a fixed sum, and sue for it, was discussed in the case of Kennedy *v.* Brown. The client cannot sue to recover a fee because of negligence in the counsel.

HONORA'RIUM (*ante*). It would be, perhaps, more precise to say that the *honorarium* was not given as a present, but strictly as a mark of honor, and the amount was not left at the will of the payer, but was rather settled by custom, varying of course with the standing of the employed. According to Braude the *honorarium* was originally applied solely to the salaries of the great officers of state, by way of intimation that they were tendered as a mark of honor.

HONORS, MILITARY AND NAVAL. See SALUTES.

HONORS OF WAR, the term used to express the privileges allowed to a garrison surrendering, either in consideration of a brave defense, or from some other cause. Many degrees of honor may be paid to a vanquished enemy, according to the generosity or judgment of the victorious commander-in-chief. In some cases, the garrison is allowed to march out with all its arms, drums beating, colors flying, etc.; at another time, the

conquered force will only be permitted to advance silently to the front of their works, there to ground or pile arms, and then, facing about, to return to their lines as prisoners of war. Occasionally, the capitulation will provide that the garrison shall deposit their arms and warlike stores at some specified spot, and then march on to their own territory on parole of not serving during the existing war against the victors or their allies.

HONO'RIA, JUSTA GRATA, a daughter of Constantius III., and sister to Valentinian III., b. 418 A.D. in Constantinople; lived at Valentinian's court in Rome. She secretly invited Attila the Hun to marry her, but as he did not entertain the proposition, she sent another invitation, and Attila accepting it, claimed with her a portion of the empire. As Valentinian refused to accede to such a demand, Attila invaded Gaul. Honoria's fate is unknown.

HONORIUS, the name of four popes.—HONORIUS I. has been the subject of much controversy, not alone between Catholics and Protestants, but also between the Gallican and Ultramontane schools of Catholics themselves. He was born of a consular family in Campania. Of his early history little is known, except that he took an active part in bringing to a close the disputes which arose in northern Italy about the controversy of the three chapters (q.v.). On the death of Boniface V. in 625, he was elected bishop of Rome. His general administration of church affairs has been favorably judged by historians; and his name is especially connected with the history of the paschal controversy in Ireland, and with that of the early Anglo-Saxon church. But his pontificate is particularly memorable on account of the monothelistic heresy. See MONOTHELISM. Honorius is connected therewith rather negatively, than by any positive participation, in the dissemination of the monothelite doctrine. While the controversy was yet new in the west, Sergius, patriarch of Constantinople, wrote to Honorius, to explain the monothelistic doctrines in the most favorable light, and to suggest that it would be most desirable to impose silence on both parties, in a dispute which really did not affect the substance of the Catholic doctrine. Honorius, misled, it is alleged, by this statement of Sergius, consented, and even expressed himself in language which would appear to condemn the doctrine of two wills in Christ. The Catholic historians, however, maintain that in thus disclaiming the belief of two wills in Christ, Honorius merely denied the existence in Christ of two discordant or conflicting wills, that is, of a *corrupt and sinful human* will opposed to the divine will. It is not easy, perhaps, to reconcile this with the decree of the sixth general council, in which Honorius is anathematized in company with many others, of whose heterodoxy there can be no doubt. But the defenders of Honorius reply, that although the sixth council certainly does include Honorius in one common condemnation with a group of heretical teachers, yet the explanation appended to the condemnation of the former, viz., that "he had not by the exercise of his apostolic authority extinguished the rising flame of heresy, but, by neglecting it, favored its progress," clearly alludes to the error of judgment described above, by which, although himself personally orthodox, he enjoined silence on the controversy at a time when a more far-sighted ruler would have felt it his duty to interfere by a clear and explicit declaration. On the whole, they maintain that, however Honorius may by his imprudent silence have compromised the interests of orthodoxy, he did not put forth any such dogmatic declaration as can fairly be regarded, whether by Protestants or by Gallicans, as irreconcilable with the strict ultramontane doctrine of infallibility, inasmuch as that doctrine contemplates the pope as "speaking from the apostolic chair." Honorius died in 638. Some letters of his are preserved in Labbe's *Coll. Conciliorum*, vol. iii.

HONO'RIUS, FLAVIUS, second son of Theodosius the great, was b., according to the best authorities, Sept. 9, 384 A.D. On the death of his father, the empire was divided into two parts, Honorius receiving the western half, with Rome as his capital; but being only 10 years old, was put under the guardianship of Stilicho (q.v.), who was all his life the *de facto* ruler of the western empire. Honorius first took up his residence at Milan, where, in 398 A.D., he married Maria, the daughter of Stilicho. The most important events of Honorius's reign were the various treaties concluded with the German tribes who dwelt on the Rhine and upper Danube; the rigorous persecution of paganism in 399; and the devastation of northern Italy by Alaric and his Visigoths in 400–403. Stilicho was then in Germany; but on his return, he speedily cleared the country of the invaders, after totally defeating them at Pollentia (Mar., 403). Another irruption of barbarians, under Rhadagaisus, took place in 405–406, which was again repelled by the powerful arm of Stilicho. Nevertheless, this brave soldier and able minister lost the favor of his weak and worthless master, and was treacherously slain at Ravenna, 408 A.D. Alaric was not slow to take advantage of the opportunity afforded him. In 408 A.D. he invaded Italy, and besieged Rome, which only escaped on payment of a heavy ransom; and in the following year he again besieged and took it, raising Attalus to the imperial purple. The death of the invader in 410 A.D., after having a third time besieged Rome, again freed Italy. A new champion of the falling empire arose in the person of Constantius, who suppressed the rebellions of Constantine, Jovinus, and Sallustius in the northern provinces, and of Heraclian in Africa. He was now appointed the colleague of Honorius in the consulship, and received in marriage the hand of Placidia, sister to Honorius, along with a share in the empire, which he did

not long enjoy, as his death took place a few months after. The Gothic and German tribes had for some time been slowly but steadily encroaching upon the western empire, and Honorius's reign saw Spain, Gaul, and Pannonia, some of the finest provinces, snatched from its grasp. He died Aug. 27, 423. Honorius's character presents few salient points. He was weak and foolish, and, when excited by fear or jealousy, cruel and treacherous, a trait well brought out in his treatment of Stilicho and Constantine.

HONT, a co. in n.w. Hungary, on the Danube; 986 sq.m.; pop. '70, 123,800. The surface is mountainous, and the soil generally fertile, producing grain, hemp, flax, and tobacco. Schemnitz is the most important town.

HONTHEIM, JOHN NICHOLAS VON, was b. at Treves in 1701. He was educated in the Jesuit school of his native city, studied canon law at Louvain under the celebrated Van Espen, and afterwards taught it for 10 years at Treves, of which see he became coadjutor in 1748, with the title of bishop *in partibus infidelium*. He is the author of two voluminous works on the history of Treves, *Historia Trevirensis Diplomatica* (3 vols. fol., 1750), and *Prodromus Hist. Trevirensis* (2 vols. fol. 1757). But his literary career is chiefly memorable for a theological essay, which, although with very mean pretensions to learning, by the novelty and boldness of its views created an immense sensation in the theological world. The title of this work, which was in Latin, and dedicated to pope Clement XIII., is "On the State of the Church, and on the Legitimate Authority of the Roman Pontiff," a work composed with a view to the reunion of Christian sects. The name of the author was for a long time unknown, the work being published under the *nom de plume* of Justinus Febronius (a name said to be taken from that of Hontheim's niece, who was called Justina Febronia), whence the system of church government which the work propounds has been called Febronianism (q.v.). His scheme may be described as a very exaggerated form of Gallicanism, with the democratic element of Congregationalism superadded. The work, immediately after its appearance, was condemned by Clement XIII., as well as by many individual bishops. It drew forth a number of replies, the most important of which are those of Zaccaria (1767) and Ballerini (1768). Pius VI., in 1778, required from Hontheim a retraction of these doctrines. This retraction, however, was modified by a subsequent *Commentary*, published at Frankfort in 1781, to which, at the desire of the pope, cardinal Gerdil replied. Hontheim eventually made full submission to the church. He died in his 90th year, at Montquinten in Luxemburg, Sept. 2, 1790.—See Menzel's *Neuere Geschichte der Deutschen*, xi. 456, and foll.

HONVÉD (land-defenders), the name given in Hungary under the earlier kings to the national champions. With the disappearance of these, the word too disappeared; but in the summer of 1848 it was revived, and applied first to those Hungarian volunteers dispatched to the south against the Servians, and subsequently, when the war with Austria really commenced, to the whole patriotic army. Since the reconstitution of Austrian affairs after 1866, the name honved has been given to the landwehr of the Hungarian portion of the empire.

HOOBLY, a t. of Dharwar (q.v.), in the presidency of Bombay, stands in lat. 15° 20′ n., and long. 75° 13′ east. It contains (1872) 37,961 inhabitants, and is one of the principal cotton marts in that section of India. A good road has been constructed to the Malabar coast, by which the raw cotton of the neighborhood is easily and cheaply transported for shipment.

HOOD, a co. in n. Texas on the Brazos river; 614 sq.m.; pop. '70, 2,585—97 colored. The surface is rough, with some prairie and much forest land. The soil is rich and productive. Comanche peak is one of the physical features; it rises 600 ft. above the Brazos Co. seat, Granburg

HOOD, JOHN BELL, b. Ky., 1831; graduated at West Point, and was on frontier duty until the beginning of the rebellion. He then joined the rebels, and was one of their most active officers, attaining the rank of lieut.gen. He was engaged at Bull Run, Antietam, Gettysburg, and at Chickamauga (where he lost a leg). In 1864 he received the command of Johnston's army in the attempt to intercept Sherman's march to the sea, but in Nov. and Dec. he suffered serious defeats from the union forces under Thomas before Nashville. He was immediately relieved from command and retired to private life.

HOOD, ROBIN, the hero of several old ballads and traditionary stories, which generally represent him as an outlaw and a robber, but of a gallant and generous nature, haunting the depths of Sherwood forest, Nottinghamshire, and of Barnsdale forest, Yorkshire, in an early era of English history, which it has hitherto been customary to fix in the 12th century. The earliest authentic notice of him is in the *Vision of Piers Ploughman*, a poem dating from between 1355 and 1365: "rhymes of Robin Hood and Randolph earl of Chester" are there alluded to. About 1495, Wynkyn de Worde printed a poem of considerable length, entitled *The Lytel Geste of Robyn Hood*—apparently a series of rude popular ballads strung together, being probably a modification of the "rhymes" spoken of in *Piers Ploughman*. Thus we see evidence for a considerable antiquity to the ballads commemorating Robin Hood, a collection of which filled

two little volumes printed by Ritson in 1795. It is also certain that, in the early part of the 16th c., there was a wide-spread celebration of annual rustic sports and masquerades, under the name of the *Robin Hood Games*, in which the deeds of the hero, and of his companions, Little John, Friar Tuck, etc., and of his sylvan mistress, Maid Marian, were represented. These even extended to Scotland, where the Reformers had some difficulty in putting them down. In the ballads and the games alike, Robin was always exhibited as a valiant man out of suits with fortune, giving to the poor much of what he took from the rich, most skillful with the long bow and the quarter-staff, and almost unfailingly victorious in personal encounters with whatsoever opponent.

In addition to these evidences of the existence of such a hero, we must remark that his grave has for ages been pointed to in Kirklees park, Yorkshire, marked by a flat stone on which was carved a flowery cross.

While there could be little doubt that some such predatory outlaw as Robin Hood once existed, and that he was of a character to excite, generally speaking, the affections rather than the reprobation of the people, there was a sad want of documentary evidence regarding him, until the publication of a tract by the Rev. Joseph Hunter in 1852. In this *brochure*, it is, first, shown that one of the ballads represents Robin as going, by the invitation of "Edward our comely king," to meet him at Nottingham; as there accepting service with his majesty; and as accompanying him to court; where, however, becoming sick almost to death with that kind of life, he did not remain above 15 months; after which he retired, and resumed his wonted free and jovial life in the forest. Mr. Hunter then proceeds to show that king Edward II. in 1323 made a progress through the western and midland counties, in the course of which he came (Nov. 9) to Nottingham; that in the exchequer accounts between Mar. and Nov. of the ensuing year, among the names of 24 "porteurs" of the king, to whom wages were paid, occur those of "Robyn and Symon Hod;" and that, finally, at the latter date occurs an entry—"Robyn Hod, heretofore one of the porteurs, because he could no longer work, received as a gift, by command, 5s.;" the name from this time appearing no more. Mr. Hunter likewise ascertained that, at a date six years antecedent to the royal progress above mentioned, the name of "Robertus Hood" is found in the court-rolls of the manor of Wakefield, as that of defender in a suit regarding a small piece of land. The probability therefore is that Robin Hood lived and acted as the ballads represent him only a few years before the era of *Piers Ploughman*, and really passed from wild forest life into the royal service for a brief space—an adventure which might appear as the most incredible attributed to him, if we did not know something of the whimsical and puerile character of Edward II., which was such that he did not disdain occasionally to seek amusement in playing at chuck-farthing with his servants. Mr. Hunter further deemed it likely that Hood was one of the yeomen who joined the discontented barons under the earl of Lancaster, and were ruined by the failure of their enterprise. If so, his life in the forest might be rather a sort of guerrilla warfare than a practice of simple rapine; and hence it might, in some measure, arise that the "gests" of Robin Hood became the subject of so much romantic and affectionate sentiment on the part of the community.

HOOD, SAMUEL (Viscount HOOD), English admiral, was eldest son of the Rev. S. Hood, vicar of Thorncombe, Devonshire, at which place he was b., 1724. At 16, he entered the royal navy, was made lieut. in 1746, and post-capt. in 1756. In 1759, being in command of the *Vestal*, 32 guns, he engaged a French 50-gun ship, which he took after a desperate action of four hours. In 1777 he was made commissioner of Portsmouth dockyard, and next year received a baronetcy. He was then made rear-admiral, was sent to the West Indies to reinforce Rodney, and commanded a division in the engagement with the count De Grasse, April 12, 1782. He was made a peer of Ireland by the title of baron Hood. In 1793 he was made commander-in-chief of the Mediterranean fleet, and took possession of the port of Toulon; but the French republican army, in great force, compelled him to evacuate it, after destroying or carrying away the principal part of the shipping, firing the arsenal and public stores. He then sailed for Corsica, which, after a campaign, he annexed to the crown of Great Britain. In 1796 he was advanced to the rank of a viscount of Great Britain, and made governor of Greenwich hospital. He died at Bath, Jan. 27, 1816.—His younger brother, ALEXANDER HOOD, served as rear-admiral under lord Howe, was second in command at lord Howe's victory of June 1, 1794, obtained a victory over the French fleet in 1795, and was made, in 1796, baron, and in 1801, viscount Bridport. He died in 1814.

HOOD, THOMAS, was b. in London in 1798, and after leaving school was placed in the counting-house of a Russian merchant, but his health failing, he was sent to Dundee. At the age of 17, he returned to London, and engaged himself to learn the art of engraving with his uncle. In 1821 he was offered the post of sub-editor of the *London Magazine*, which he accepted, and at once entered upon its duties and an extensive literary acquaintance. His first separate publication was entitled *Odes and Addresses to Great People*. He published *Whims and Oddities* in 1826, of which a second and third series appeared during the two following years. In 1829 he commenced *The Comic Annual*, and continued it for nine years. He edited *The Gem* for one year, contributing to its pages his striking poem entitled *Eugene Aram's Dream*. In 1831 he went to reside at

Wanstead in Essex, where he wrote his novel of *Tylney Hall;* but pecuniary difficulties supervening, he returned to London in 1835. In 1838 he commenced the publication of *Hood's Own,* to which his portrait was attached. Health failing about this time, he went to reside on the continent, and remained six years. In 1839 he published *Up the Rhine,* the idea of which was taken from *Humphry Clinker.* On his return to England, he became the editor of *The New Monthly Magazine,* and on his withdrawal from its management in 1843, he published *Whimsicalities,* consisting chiefly of his contributions to that serial. In 1844 he started *Hood's Magazine,* and contributed to its pages till within a month of his death. During his last illness, sir Robert Peel conferred on him a pension of £100 a year, which was transferred to his wife. He died on May 3, 1845, and was buried in Kensall Green cemetery. Compare *Memorials of Thomas Hood, Collected, Arranged, and Edited by his Daughter, with a Preface and Notes by his Son* (2 vols. 1860).

Hood takes a high place both as a humorist and as a serious poet. He is great at once in comedy and pathos, and he sometimes curiously mingles and combines both. As a punster, he was supreme: he connects far-separated words and ideas by the most subtle analogies, and sends them loose. Much of his comedy, however, is verbal and shallow, and will be soon forgotten. It is as a poet that Hood will be remembered. His *Eugene Aram's Dream, Song of the Shirt,* and *Bridge of Sighs,* are among the most perfect poems of their kind in the English language.

HOODED SEAL, *Stemmatopus cristatus,* Cuv.; *phoca cristata,* Gmel.; *phoca leonina,* Fabr., an animal inhabiting the coasts of Greenland, and North America as far s. as the United States. They are generally found in the ice islands and floating ice-fields in the open sea, visiting the land in April, May, and June. About 2 in. from the extremity of the upper jaw there is a cartilaginous crest, increasing in height as it passes backwards to the back part of the head, where it is about 7 in. high, having a longitudinal depression in the middle, about an inch deep. This crest is an elongation of the septum of the nose, the true nostrils opening on either side of it. It terminates in a muscular hood covered with fur. The whole apparatus is probably accessory to the organ of smell, and, as the fishermen suppose, serves as a reservoir of air while the animal is under water. The females and young have the organ in a rudimentary state. The hooded seal is polygamous and brings forth its young on the ice. It is quite fierce, and will defend itself when encountered, and the animals often have fierce battles with each other. It has a voice resembling the bark and whine of a dog, and when attacked weeps copious tears. It and the rough seal furnish most of the skins sent to market.

HOOD-MOLDING. See DRIPSTONE.

HOOFS. (See HORNY TISSUES.) The healthy soundness of the horse's foot is mainly preserved by permitting it to grow uninjured by the rasp and knife (see HORSE-SHOEING), whilst its toughness is secured, and undue dryness and evaporation prevented, by smearing daily the crust, sole, and frog with a little glycerine, or a mixture made by melting together a quarter of a pound each of tar, honey, beeswax, and glycerine, with a pound of lard. Softness and brittleness of the hoof, which are fruitful sources of cracks and corns (q.v.), may be remedied by the regular use of such dressings, by placing the feet for several hours daily in thick woolen swabs, kept cool and moist by frequent applications of cold water, and by encouraging a more healthy growth of horn by occasional mild blisters round the coronary band. Cracks, or sand-cracks, as they are termed, mostly occur amongst horses much upon the road, cause lameness, and constitute unsoundness. When serious and recent, poulticing, thinning away of the crust about the crack, and perfect rest are essential. After the earlier heat and tenderness are removed, a hot iron should be drawn at right angles to the crack, both above and below, so as to separate the diseased from the sound horn. Waxed thread or fine wire should be wound round the hoof, and a sound growth of horn stimulated by a blister round the coronet. The horse's hoofs are too hard and coarse to be employed for the making of the better class of combs and buttons, for which purpose the hoofs of cattle, to the value of nearly £5,000, are annually imported. They are, however, largely used by manufacturers of prussiate of potash and artificial manures.

HOOFT, PIETER, a Dutch historian and poet, was born at Amsterdam, Mar. 16, 1581, studied at Leyden, and traveled in France, Germany, and Italy. He died at the Hague, May 21, 1647. The chief historical works of Hooft are *Het Leven van Koning Hendrik IV.* (Amst. 1626–1652), and *Nederlandsche Historien* (2 vols. Amst. 1642–1654; most recent edition, 1820–23). The latter of these is still of the greatest value, and is considered one of the classics of Dutch literature. Hooft also translated Tacitus into Dutch. As a poet, his *Minnedigte* have not been surpassed, if even equaled, as specimens of the light Anacreontic muse. His *Letters* were published by Huydecooper in 1738. Hooft has exercised an important influence on the development of the Dutch language.

HOOGLY, a river of Bengal Proper, is formed, in lat. 23° 25′ n., and long. 88° 22′ e., by the junction of the first two offsets of the Ganges, the Bhagrutti and the Jellinghi. From the point in question, the stream, strictly so called, is 125 m. long; the

estuary, as far as Saugor roads, measuring 35 m. more. Of all the channels by which the Ganges reaches the sea, the Hoogly is the most available for navigation. In the dry season, the tide is felt nearly up to Chandernagore, 17 m. above Calcutta. During the s.w. monsoon, the Hoogly is subject to the phenomenon known as "the bore" (q.v.). Up to Calcutta the draught is seldom less than 17 ft.; but the bottom is said to be silting up. At its entrance, too, the Hoogly is much encumbered with shoals.

HOOGLY, an extensive district in the province of Bengal, formerly called Saatgong, between lat. 22° and 23° n., and extending a considerable distance along the right bank of the river Hoogly. It is bounded on the n. by the district of Burdwan, on the s. by Hidjelee, on the e. by the Hoogly, and on the w. by Midnapoor. This district consists of low, flat land, very fertile, but that part which is nearest to the sea is very thinly inhabited; it is called the Sunderbund, is swampy, covered with wood, and remarkably unhealthy. It is intersected in every direction by rivers and their branches, which afford great facilities for internal navigation. Along the shores of the ocean salt of an excellent quality is manufactured for the government. The area is 2,089 sq. miles. The pop. is given at 1,520,840, an amount which, compared with the area, indicates the extraordinary density of 728 to the sq. mile. The French settlement of Chandernagore is situated within the limits of the district, as are also Chinsura, and Serampore, now British possessions, but formerly belonging, the first to the Dutch, and the latter to the Danes. The right of the East India company to the district originated in the treaty concluded with Meer Cossin in 1760.

HOOGLY, a city of Bengal Proper, stands on the right or western bank of the river Hoogly, 27 m. n. of Calcutta, in lat. 22° 54′ n., and long. 88° 22′ e. It is estimated to contain (1871) along with Chinsura (q.v.), 34,761 inhabitants. Here is a college for English and Asiatic literature, which owes its existence mainly to the munificence of a native; it has several schools allied with it. The district of Hoogly, with Howrah, contains 1424 sq.m., and a pop., '71, of 1,488,556.

HOOK, THEODORE EDWARD, a celebrated novelist and dramatic writer, was b. in London, Sept. 22, 1788, and educated at Harrow. In 1805, at the age of 17, he produced an operatic farce called the *Soldier's Return*, which was very successful; and between that year and 1811, he wrote 12 other operatic pieces and farces, all of which were popular at the time. His ready wit, sparkling humor, and wonderful powers of improvisation, made him the delight of society; and having pleased the prince regent by his feats of mimicry, he was appointed (1813) accountant-general and treasurer of the Mauritius, with a salary and allowances amounting to nearly £2,000 a year. These offices he held till 1818, when the discovery of a considerable deficiency in the military chest caused him to be arrested and sent to England, and his effects seized and sold. The peculation, it afterwards appeared, had been committed by his deputy, who destroyed himself. On obtaining his liberty, Hook supported himself by writing for the newspapers and magazines, and on the establishment of the *John Bull*, weekly tory newspaper, in 1820, he was appointed its editor. From his connection with this bold, clever, and, at that time, virulent print, he derived, during its prosperous state, fully £2,000 a year. In Aug., 1823, for his debt to the government, amounting to about £12,000, he was arrested under an exchequer writ, and his property sold. He remained within the rules of the king's bench till May, 1825, when he was released from custody. In 1824 appeared, in 3 vols. 8vo, the first series of his *Sayings and Doings*, which yielded him £2,000. A second series followed in 1825, and a third in 1828, for each of which he received 1000 guineas. Several other three-volumed novels were published by him in rapid succession, such as *Maxwell*, 1830; *Love and Pride*, 1833; *Gilbert Gurney*, which contains a sort of autobiography of himself, 1835; *Jack Brag*, 1837; *Births, Deaths, and Marriages*, 1839; *Gurney Married*, 1839; etc. He died Aug. 24, 1841.

HOOK, Rev. WALTER FARQUHAR, D.D., a son of the Rev. James Hook, dean of Worcester, was, b. at Worcester about the beginning of the century, and educated at Christ Church, Oxford, where he graduated in 1821. After holding some minor preferments in the church, he was appointed vicar of Leeds in 1837, and in 1859, dean of Chichester. In 1856 the bishop of Ripon, on taking leave of the clergy of his diocese, stated that 20 churches had been built in Leeds through the exertions of Dr. Hook, while schoolrooms had been provided for more than 10,000 children. Among his works are *An Ecclesiastical Biography, containing the Lives of Ancient Fathers and Modern Divines* (8 vols. Lond. 1845–52); *A Church Dictionary* (8th ed. 1859), *Sermons Suggested by the Miracles of our Lord and Savior Jesus Christ* (2 vols. 1847); *On the Means of Rendering more Effectual the Education of the People* (10th ed. 1851), and *Lives of the Archbishops of Canterbury*, on which he was working to the last, the eleventh volume, containing the lives of Laud and Juxon, appearing immediately after his death, which took place in Oct., 1875. He was elected a fellow of the royal society in 1862.

HOO'KAH. See PIPE.

HOOKE, NATHANIEL, d. 1763; a native of Ireland: author of a *History of Rome*, embracing the period extending from the foundation of the city to the time of Augustus. It was published in 4 vols. at intervals of 40 years between the appearance of the first and the last. His work possesses the virtues of acuteness and clearness.

In opposition to Middleton, he defended the cause of the plebeians against the patricians. Hooke was a zealous Roman Catholic. When Pope was dying, a priest was brought to hear his confession and grant him absolution. This priest was brought by Hooke. He had been employed and well paid by the duchess of Marlborough for assisting her in writing her memoirs, but he was so zealous in attempting to convert the duchess to Catholicism that a quarrel was the consequence. He was one of the sufferers from the South Sea bubble. Besides his *Roman History*, he wrote *Observations upon the Roman Senate*, in which he advanced and extended the political views propounded in his *History*. He also translated from the French the life of Fénélon, and Ramsay's *Voyages de Cyrus*.

HOOKE, ROBERT, an English natural philosopher, b. at Freshwater, Isle of Wight, July 18, 1635, was educated at Westminster school, and at Christ Church, Oxford. In 1662 he was appointed curator of experiments to the royal society, and in 1677 became its secretary; in 1664 professor of geometry in Gresham college, London; and in 1666 surveyor for the city of London, a most lucrative appointment. He died at Gresham college, Mar. 3, 1703. He was a man of extraordinary inventive genius, and has justly been considered as the greatest of philosophical mechanics; the wonderful sagacity, nay, almost intuition, he showed in deducing correct general laws from meager premises, has never before or since been equaled. There was no important invention by any philosopher of that time which was not in part anticipated by Hooke. His theory of gravitation subsequently formed part of Newton's; he anticipated the invention of the steam-engine, and the discovery of the laws of the constrained motions of planets. Among his own completed discoveries are, the law of the extension and compression of elastic bodies, "*ut tensio sic vis;*" the simplest theory of the arch; the balance-spring of watches and the anchor-escapement clocks; the permanency of the temperature of boiling water. The quadrant, telescope, and microscope are also materially indebted to him.

HOOKER, JOSEPH, 1815–79; b. Mass., graduated at West Point in 1837, and served in the Florida and Mexican wars. At the battle of Monterey, he made himself conspicuous for gallantry, securing the brevet of capt., and when gen. Scott assumed command, Hooker was made assistant adjt.gen. He went through the campaign, from Vera Cruz to the city of Mexico. During the struggle at National Bridge, he so distinguished himself as to gain the brevet of major, and his services at Chapultepec obtained for him another brevet, that of lieut.col. In 1853 he resigned from the army and commenced farming in California. When tidings of the firing on Sumter reached him, he hurried to Washington and offered his services to the government. He was at once commissioned brig.gen. of volunteers, commanding a brigade in the department of Annapolis and subsequently a division. He led several expeditions across the Potomac in the winter of 1861–62, capturing or destroying rebel batteries. In April, 1862, he took command of the 2d division of the 3d corps on the peninsula, and distinguished himself in the siege of Yorktown, May 4; the battle of Williamsburg, May 5, and the succeeding pursuit; Fair Oaks, May 31 and June 1; and during the "seven days' battle," especially at Malvern hill, and became known as "fighting Joe Hooker." He was made maj.gen. for gallantry, his commission dating July 4, 1862, but afterwards dated back by the president to May 5. He also took a prominent part at Bristoe station, the second Bull Run, Chantilly, and South mountain, and at Antietam was wounded. Sept. 20 he was commissioned brig.gen. in the regular army. He commanded a grand division under Burnside in the battle of Fredericksburg, and succeeded him in command of the army of the Potomac, Jan. 26, 1863. In May he fought the battle of Chancellorsville, and June 27 resigned his command, being succeeded by gen. Meade.

In Sept. following he took command of the 12th and 13th army corps near Chattanooga, and took part in the battles in that vicinity in Nov., and commanded in the battle of Lookout mountain, for which he was made brevet maj.gen. Later he commanded the 20th corps, known as the army of the Cumberland, near Atlanta, but resigned this command in Aug., 1864. In Sept., 1864, he took command of the northern department, of the department of the east in 1865, and in 1866 of that of the lakes; and in Sept., 1866, was mustered out of the volunteer service. In 1878 he was made brevet maj.gen. of the regular army, and retired from service. His health was greatly impaired, a paralytic affection disabling him in great degree. He resided much of his time at the hotel in Garden City, L. I., and died there in Mar., 1879.

HOOKER, JOSEPH DALTON, M.D., C.B., F.R.S., was b. at Glasgow in 1816, and is the only surviving son of sir W. J. Hooker (q.v.). He was educated for the medical profession, and graduated as M.D. at Glasgow in 1839. He immediately thereafter renounced the pursuit of medicine for that of botany, and joined the antarctic expedition of the *Erebus* and *Terror*. When he returned in 1843, he brought with him 5,340 species of plants, which, with the discoveries of capt. Cook and other voyages, were published in 6 quarto vols., under the title of *Botany of the Antarctic Voyage* (1847–60). This great work gave him at once an eminent position in science. In 1847, he undertook an expedition to the Himalayas, which occupied him for three years. The large collections made at this time were joined to those of his friend, Dr. Thos. Thomson of the botanic gardens, Calcutta, and numbered in the aggregate nearly 7,000 species. His *Himalayan Journals* (2 vols. 8vo, 1854) contain the narrative of this expedition, and

the *Rhododendrons of the Sikkim-Himalaya* (1849–51) illustrate the most remarkable additions which he made to the ornamental plants of our gardens on this occasion. With Dr. Thomson he undertook a *Flora Indica* (vol. i., 8vo, 1855), the first volume of which, containing only a few orders of plants, remains a fragment. The half of the volume is occupied with a valuable dissertation on botanical geography, a department of the science which has received special attention from Dr. Hooker in his various works. He afterwards again undertook a flora of British India, which was completed in 1874. In 1871 he made an expedition to Morocco, ascended the Great Atlas, the summit of which had never before been reached by a European, and brought back a valuable collection of plants.

Dr. Hooker was appointed assistant-director at Kew gardens in 1855, and on the death of his father in 1865, he succeeded him as director. He was president of the British association in 1868, was appointed companion of the Bath in 1869, and elected president of the royal society in 1873. He became knight commander of the star of India in 1877, and LL.D. of Dublin in 1878.

In the list of scientific memoirs published by the royal society, he is recorded to be the author of 58 independent memoirs, and the joint-author of 18 more. He has prepared a valuable *Students' Flora of the British Islands*, chiefly characterized by the record of the geographical distribution of the species. His great work, which he has undertaken in conjunction with his friend George Bentham, is the *Genera Plantarum*, the first part of which appeared in 1862.

HOOKER, RICHARD, author of the books of Ecclesiastical Polity, and one of the most illustrious of English theologians, was born in the city of Exeter, or its neighborhood, about the year 1554. He was early distinguished for his "quick apprehension of many perplext parts of learning," and attracted the notice of Jewell, bishop of Salisbury, through whose influence he was sent to Oxford about his 15th year. He was placed at Corpus Christi college. He was advanced first to the dignity of scholar, and then of fellow of his college. After about three years' residence in his college as fellow, he entered into sacred orders, and ere long was appointed to preach at St. Paul's Cross. Hither all the power and eloquence of the church found their way in the 16th century. To Hooker, however, the trial of such a public appearance was evidently considerable, according to Walton's account; and the more as the weather proved very unfavorable for his journey; "but a warm bed and rest, and drink proper for a cold, given him by Mrs. Churchman, and her diligent attendance added unto it, enabled him to perform the office of the day, which was on or about the year 1581." Mrs. Churchman's kindness proved too much for the simple-minded theologian. He was led, evidently without due consideration, into a marriage with her daughter. This marriage of Hooker, as is known to all, was far from proving a source of happiness—a result that could scarcely have been expected from its commencement. Walton's description of the visit of his two old pupils, Edwin Sandys and George Cranmer, and "Richard called to rock the cradle" from their company, is among the most characteristic sketches of this fine old writer. The visit was made to Drayton-Beauchamp, in Buckinghamshire, where Hooker had settled in 1584, as a country priest, after his marriage. He was transferred ere long to the mastership of the Temple, by the patronage of archbishop Whitgift; and here he was plunged into the controversy with Puritanism, out of which his great work arose. Travers, one of the most zealous of the Elizabethan Puritans, was his colleague in the Temple. Travers was the more attractive and popular orator, if the less profound thinker. The union was not a happy one. The congregation "ebbed in the forenoon," Fuller tells us, "and flowed in the afternoon." "Pure Canterbury" was in the ascendant in the morning, "Geneva" in the afternoon. Hooker soon tired of the contention in the congregation, and the indifference of the majority to his ministry. He accordingly applied to the archbishop, who presented him, in the year 1591, to the rectory of Boscum, in the diocese of Salisbury, and 6 m. from that city. Here he remained for four years, busily employed with his great work, which his experience in the Temple probably prompted. The first four books of the Ecclesiastical Polity appeared in 1594. In the same year he was transferred to the living of Bishopshorne, near Canterbury, where he spent the few remaining years of his life, and gave to the world the fifth book of the Polity. The remaining three books were posthumous. About the year 1600, in the 46th year of his age, he caught cold in his passage from London to Gravesend, and gradually sunk under the weakness which followed.

Hooker will always be esteemed one of the most illustrious thinkers and writers, not only in English theology, but in English literature. He is alike comprehensive and profound, tranquil and eloquent. He is speculative without mysticism, and earnest without declamation. He searches all the depths and rises to all the heights of his subject, without ever forgetting the simplicity of the Christian or breaking the charm of catholic association that binds all its parts together. More than anything, he is wise and *judicious* in the highest sense of that word; and it is the light of lofty and calm wisdom, shining through his pages, that continues to make them a delightful and excellent study, when most of the contemporary theological works are forgotten.

HOOKER, THOMAS, 1586–1647; b. England; graduated at Cambridge, and was a preacher in London. He was silenced for non-conformity, and then set up a grammar

school in which John Eliot, afterwards known in New England as the "apostle of the Indians," was usher. After preaching in Holland he came, in 1633, to America, and was ordained at Cambridge. Three years afterwards he went with about 100 other colonists to Connecticut, where they settled at Hartford, as it was afterwards called, where he and Samuel Stone were the first ministers. He preached usually without notes, but about 200 of his sermons were reported and sent to England, where half of them were published. His most important literary work was *A Survey of the Sum of Church Discipline*, written in conjunction with John Cotton, and published in England.

HOOKER, Sir WILLIAM JACKSON, F.R.S., a celebrated English botanist, was b. at Norwich in 1785. His first work was a *Journal of a Tour in Iceland* in 1811, which attained such popularity that a second edition was called for in 1813. From that time to his death in 1865, he was almost incessantly engaged in the publication of botanical works. His investigation on the British jungermanniæ and mosses led to his appointment to the chair of botany in the university of Glasgow, where he lectured with great success till 1841, when he resigned his professorship on being chosen director of the royal gardens at Kew, an office which he filled in a most efficient manner. His name was enrolled in the lists of all the scientific societies at home and abroad; and he was knighted in 1836, on account of his high scientific acquirements. The following are some of the most important of his works: 1. *Monograph of the British Jungermanniæ* (1812–16); 2. *Muscologia Britannica*, containing the mosses of Great Britain and Ireland (1818); 3. *Icones Filicum* (in association with Dr. Greville), (2 vols. fol. 1826–37); 4. *The British Flora* (1830), a work that has gone through seven editions; 5. *A Century of Orchidaceous Plants* (4to, 1848); 6. *The Victoria Regia;* 7. *Icones Plantarum* (10 vols. 1837–60); 8. *British Ferns* (1862); 9. *Garden Fern* (1862).

HOOKER, WORTHINGTON, 1806–67; graduated in medicine at Harvard, and practiced in Connecticut until 1852, when he became professor of the theory and practice of medicine in Yale college, and remained there through life. His principal works are *Physician and Patient*, and *Lessons in the History of Modern Delusions.*

HOOKS AND EYES. These small articles are largely used in millinery for dress-fasteners, and are of great utility. Formerly, they were made by hand, the wire of which they are formed being bent into the proper shape by pliers; now, however, they are entirely made by machines of great simplicity and beauty. With a pair of them it is possible to make 200 hooks, and the same number of eyes, in one minute. The operations of the machines are, first, to draw the wire forward from the supplying-reel, then cut off the length required for hook or eye, as the case may be; a sinker then descends and forces it into a slot, by which it is bent, and two projecting cams, acting at the same time on the two ends, bend them over so as to form the lateral loops used for sewing the hook or eye to the garment; then, in the case of the hook, it is passed under another sinker, which forces the double wire into another slot, and forms the hook part; one side of the slot, being movable, is made to strike the bent portion of the hook sufficiently to flatten it. It is then complete, and drops out, to make room for another.

HOOK-SQUID, the name commonly given to cephalopod mollusks of the genera *onychoteuthis* and *enoploteuthis*, allied to the common squids or calamaries (q.v.), but having the eyes destitute of any covering of skin. The arms have two rows of suckers; the tentacles much exceed them in length, and are furnished with hooks at their extremities. Hook-squids are found in the Sargasso sea, in the Polynesian seas, etc. They are much dreaded by swimmers and divers, being often of large size—sometimes 6 ft. long or more—whilst their hooks, their many arms, their very numerous suckers, and their strong, sharp mandibles, entitle them to a place amongst the most formidable monsters of the deep.

HOOP ASH. See NETTLE-TREE.

HOOPER, JOHN, an English prelate and martyr, was b. in Somersetshire about 1495, and educated at Oxford. By the study of the works of the German reformers, and of the Scriptures, he was converted to Protestantism, and about 1540 he went to the continent, and spent some time in Switzerland. At the accession of Edward VI., in 1547, he returned to England, and became a preacher in London. In 1550 he was appointed bishop of Gloucester, but his objections to wearing the episcopal vestments caused some delay in his consecration. In 1552 he received the bishopric of Worcester *in commendam*. On the commencement of Mary's reign, in 1553, he was committed to the Fleet, where he remained for 18 months, being frequently examined before the council; but continuing firm in the Protestant faith he was condemned as a heretic, and burned at the stake at Gloucester, Feb. 9, 1555. He was the author of numerous sermons and controversial treatises.

HOOPER, WILLIAM, 1742–90: b. Boston; graduated at Harvard and studied law in the office of James Otis; removed to North Carolina and practiced with great success. He was a political leader there, a member of the continental congress, and one of the signers of the declaration of independence.

HOOPING-COUGH, or **PERTUSSIS,** is an infectious, and sometimes epidemic disease, mostly attacking children, especially in the spring and autumn. Its earliest

symptoms, which usually appear five or six days after exposure to infection, are those of a common cold, as hoarseness, a watery discharge from the eyes and nose, oppression of the chest, a short, dry cough, and more or less feverishness. This stage, which is called the *catarrhal*, lasts a week or ten days, when the fever remits, and the cough begins to be followed by the peculiar whoop which characterizes the disease, and which is caused by the inspiration of air through the contracted cleft of the glottis. See LARYNX. The disorder may now be regarded as fully developed, and consists of paroxysms of severe coughing, which usually terminate in the expectoration of glairy mucus, or in vomiting. During the fit of coughing, the face becomes red or livid, the eyes project, and the child seizes some person or object near him for support. These paroxysms occur at uncertain intervals, but usually about every two hours, and between them the child returns to his play, takes his food with good appetite, and exhibits little or no sign of illness. The disease reaches its height at about the end of the fourth week, after which the paroxysms diminish in frequency, and the patient shows signs of improvement. The second stage may last from two to eight weeks, and is succeeded by what may be termed the convalescent stage, the duration of which is very variable.

This is one of those diseases which seldom occur more than once in a lifetime; and hence it probably is that, as few children escape it, it is comparatively rarely noticed in adults. Morbid anatomy has failed to throw any direct light upon its special seat. The proportion of deaths to recoveries in cases of hooping-cough has not been satisfactorily determined, but when there is a severe epidemic, the mortality due to this disease is often very great; the deaths, however, in the great majority of cases, occur amongst the poorer classes. This mortality is, in reality, due rather to the bronchitis and pneumonia (or inflammation of the lungs), which are frequent complications of hooping-cough, than to the disease itself.

The treatment of hooping-cough, as long as it is uncomplicated or simple, should not be meddlesome. Nothing that can be prescribed in the early stages will check its natural course, and the object of the physician should be to ward off complications and to conduct the disease safely to its natural termination. The diet should consist of milk and unstimulating farinaceous matters. The bowels should be kept moderately open. If the weather is cold, the child should be kept in the house with the temperature of the room at about 60°. A grain or a grain and a half of ipecacuanha may be given three or four times a day. Slight counter-irritants may also be applied to the surface of the chest; Roche's embrocation, which consists of olive oil, with half its quantity of the oils of cloves and amber, is extensively used for this purpose. Nothing is so serviceable in the last or convalescent stage as change of air, often even when from a pure to a comparatively impure atmosphere; and next to this, the internal use of a solution of binoxide of hydrogen (see HYDROGEN, BINOXIDE OF,) seems most worthy of trial.

HOO'POE, *Upupa*, a genus of birds of the order *insessores*, tribe *tenuirostres*, and family *upupidæ*. To this family are referred also the genera *promerops*, *epimachus* (plume-birds), etc., natives of warm parts of Asia and its islands, Australia, and Africa, some of which are remarkable for magnificence of plumage. In the whole family, the bill is long and slender, the wings of moderate size or short, the legs short, the toes long, and the claws strong and curved. There are among them, however, great diversities, which have led some to divide them into two families, *upupidæ* and *promeropidæ*. The genus promerops and its nearer allies have a close relation to the *meliphagidæ*, which they resemble in partly feeding on the sweet juices of plants, in order to which the tongue is extensile and divided at the tip. The hoopoes, on the other hand, exhibit many points of resemblance to the crow family, with which they are connected by the choughs, and some points of resemblance even to hornbills. The tongue is short, and not extensile. The COMMON HOOPOE (*U. epops*) is an African bird, a summer visitant of most parts of Europe, found also in some parts of Asia; not of frequent occurrence in Britain, although sometimes seen in autumn, very seldom breeding in any part of the island. It is about the size of a missel-thrush; its plumage exhibits a fine mixture of white, buff, and black; and it has a large crest of two parallel rows of feathers. The hoopoe derives its name from its very frequent utterance of a low, soft sound resembling the syllable *hoop*.

HOOPS. See CRINOLINE.

HOORN, a decaying t. and seaport of the Netherlands, in the province of North Holland, is agreeably situated on a bay of the Zuyder Zee, 20 m. n.n.e. of Amsterdam. It was at one time one of the most flourishing towns of its province; but, like all the towns of North Holland situated on the Zuyder Zee, it has greatly fallen off in trade and prosperity. There are at Hoorn extensive markets for butter and cheese, and fishing and commerce are carried on to some extent. Here the large nets for herring-fishing were invented. Pop. 10,000.

HOOSAC TUNNEL. See TUNNEL.

HOP, *Humulus lupulus*, a perennial dioecious plant of the natural order *cannabinaceæ* (q.v.), the only species of its genus. It has long rough twining stems, and stalked 3- to 5-lobed rough leaves, and is a plant of luxuriant growth and abundant foliage. The male

flowers grow in loose branching axillary panicles, and consist of five stamens surrounded by a 5-lobed perianth. The female flowers are in *strobiles*, or cones, with large persistent, concave, entire scales, which enlarge as the fruit ripens. The part of the hop so much used in brewing, and sold under the name of *hops* (q.v.), is the ripened cone of the female plant. Female plants alone, therefore, are cultivated to any considerable extent, it being enough if a few male plants are scattered over a field.

The oil of hops is sedative, anodyne, and narcotic; and hence the value of pillows stuffed with hops in cases of mania, sleeplessness, etc. The bitter principle is not narcotic, but it is tonic. The oil and bitter principle combine to make hops more useful than camomile, gentian, or any other bitter, in the manufacture of beer; and hence the medicinal value of *extra-hopped* or *bitter* beer. The *tannic* acid contained in the strobiles also adds to the value of hops, and particularly as causing the precipitation of vegetable mucilage, and consequently the clearing of beer. The hop is first mentioned by Pliny as one of the garden-plants of the Romans, who, it appears, ate the young shoots as we eat asparagus; and, in fact, many country people in England do the same at the present day. It is a native of Europe and of some parts of Asia, a doubtful native of Britain and of North America. It is more extensively cultivated in the s. of England than in any part of the world, but also to a considerable extent in Germany, France, Flanders, and southern Russia, and now successfully in North America and in Australia and New Zealand.

The cultivation of the hop was introduced into England from Flanders in the time of Henry VIII., but did not become sufficient for the supply of the kingdom till the end of the 17th century. For some time after hops began to be used in brewing, a strong prejudice existed against the innovation; and parliament was petitioned against hops, as "a wicked weed, that would spoil the taste of the drink and endanger the people." Above 60,000 acres are now employed in the cultivation of hops, chiefly in the counties of Kent, Sussex, Worcester, and Hants; the two former counties producing the best hops in the world. Fields of hops are to be seen as far north as Nottinghamshire.

The hop requires a very rich soil, and its growth is promoted by the liberal application both of organic and mineral manures; although excessive manuring is prejudicial. It spreads rapidly underground by its roots, and is not easily extirpated where it has once been introduced. It is generally propagated by layers or cuttings, which usually grow for a year in a nursery before being planted out. In the plantations they are generally placed in groups of three or four, at distances of from six to nine feet. Great care is necessary in fastening the stems to the poles when they begin to shoot, setting up any that may be blown down, etc. The stalks, or *bines*, are taken down from the poles after the hop-picking, and cut and removed, to be used as litter or as manure, for which purposes they are excellent. The fresh bines, which are cut to prevent undue luxuriance in summer, are dried for feeding cattle, and are as good as the best clover hay.

The fiber of the stems is employed to a considerable extent in Sweden in the manufacture of a coarse kind of cloth, which is strong, white, and durable; but the fibers are so difficult of separation that the stems require to be steeped in water for a whole winter.

The hop-plant often suffers very much, and the prospects of the farmer are destroyed by the hop-mildew, and by insect enemies, the worst of which are noticed in subsequent articles. See HOP-FLEA, etc.

HOPE, Sir JAMES, b. Scotland, 1808; entered the British naval service in 1822, and in 1838 was appointed captain. He was in the river Platte expedition in 1844, and during the Crimean war in the Baltic fleet. In 1859 he was in chief command on the Chinese coast, and was knighted for valuable services. In 1870 he became admiral, and in 1878 was placed on the retired list.

HOPE, THOMAS, a distinguished author and patron of art, ancient and modern, was b. in London about 1770. While still a youth, he traveled over a large portion of Europe, Asia, and Africa, and collected many drawings, chiefly of buildings and sculptures. In England he first attracted attention by the splendid decorations which he bestowed on the interior of his mansion in Duchess street, Portland place, London, a description of which appeared in his book on *Household Furniture* in 1805, a work that completely revolutionized the taste of this country. In 1809 he published his *Costume of the Ancients*, the influence of which was undoubtedly very great. His essay on the *Architecture of Theaters*, belonging to the same year, also deserves mention. Three years afterwards appeared his *Modern Costumes*, and in 1819 his *Anastasius, or Memoirs of a Modern Greek at the close of the 18th Century*. This last work is his masterpiece. It was published anonymously, and was said by many people to be a production of lord Byron's, who was greatly flattered by the rumor. It is certainly a brilliant and erudite performance, but is tedious and obscure in many places. It wants the dramatic *vis* of a genuine work of genius, and is now hardly if ever read. The only other works of Hope worth mentioning are his essay *On the Origin and Prospects of Man*, a very heterodox but rather eloquent piece of writing, and a *Historical Essay on Architecture*, both of which were published posthumously. Hope died Feb. 3, 1831.

HOPE, THOMAS CHARLES, 1766–1844; for more than half a century professor of chemistry in Glasgow and Edinburgh universities. He discovered a new earth, which

he named strontites, in a mineral found in the strontian lead-mines in Argyleshire. He made many important investigations. Some of his papers are *On the Point of the Greatest Density of Water; Observations and Experiments on the Colored and Colorable Matters in the Leaves and Flowers of Plants;* and *On the Chemical Nomenclature of Inorganic Compounds.*

HOPE AND COMPANY, a famous banking-house of Amsterdam, started, about the close of the 17th c., by Henry Hope, a Scotchman. The head of the firm at the time of its greatest prosperity was another Henry Hope (1736–1811), b. Boston, Mass., the son of a Scotch royalist. Thomas Hope, the author of *Anastasius*, was also a partner. Another partner, and a remarkable financier, was Peter C. Labouchere, whose marriage with a daughter of sir Francis Baring brought the two great banking-houses into intimate business relations. The Hope house has had heavy transactions with European governments, particularly with Holland and Russia. On one occasion the latter government owed the house $25,000,000. The present head of the firm is Adrian Elias Hope, b. 1845.

HOP-FLEA, *Haltica concinna*, a very small coleopterous insect, not quite one-tenth of an inch in length, which often does much mischief in hop-plantations in spring, devouring the tender tops of the young shoots. It is of the same genus with the turnip-flea (sometimes called turnip-fly), so destructive to turnips.

HOP-FLY, *Aphis humuli*, a species of *aphis* (q.v.) or plant-louse, important on account of the injury which in some seasons it does to hop-plantations. It is, indeed, the principal cause of the great difference between the hop-crop of one year and of another, causing the variations in price and the speculations for which the hop-trade is notable.—The winged female is green, with a black head, and spots and bands of black on the body; the legs are long. A few winged females appear about the end of May, and wingless multitudes are sometimes to be seen by the middle of June, on the under side of the hop-leaves and on the stems. *The fly* is the great dread of hop-cultivators, and no means have been found of arresting its ravages. Lady-birds and other insects render important service by devouring the aphides and restraining their excessive multiplication. It is proposed, in Kirby and Spence's Entomology, that women and children should be employed to pick off the winged aphides on their first appearance.

HOP-FROTH-FLY, or HOP-FROG-FLY, *Amblycephalus interruptus*, a species of froth-fly (q.v.) which sometimes appears in great numbers in hop-grounds, and does considerable mischief. The perfect insect is about a quarter of an inch long, of a yellow color variegated with black. It frequents hedges and grassy places as well as hop-plantations.

HÔPITAL, MICHEL DE L', was b. at Aigueperse, in Auvergne, in 1505, studied law at Toulouse, and first made himself known as an advocate in the parliament of Paris, and after discharging various public functions became chancellor in 1560, during the minority of Francis II. France at this time was torn by contending factions. The Guises, in particular, were powerful, ambitious, and intensely Catholic; and when one of the family, the cardinal de Lorraine, wished to establish the inquisition in the country, Hôpital boldly and firmly opposed him, and may be said to have saved France from that detestable institution. He summoned the states-general, which had not met for 80 years, and, being supported by the mass of moderate Catholics, he forced the Guises to yield. His speech at the opening of the assembly was worthy of his wise and magnanimous spirit: "Let us do away," said he, "with those diabolical words of Lutherans, Huguenots, and papists—names of party and sedition; do not let us change the fair appellation of Christians." He induced the assembly to pass an ordinance abolishing arbitrary taxes, regulating the feudal authority of the nobles, and correcting the abuses of the judicial system. In the following year he secured various benefits for the persecuted Huguenots; but politico-religious passions were too fierce and vindictive in France in those days to be satisfied with anything but blood; and in spite of the most strenuous efforts which Hôpital could make, the nation was plunged in the horrors of civil war, ending rather in the success of the Guises, the political *ultramontanes* of their day. The old patriot, who loved France too well to be either Huguenot or ultramontane, went into retirement, where he heard the news of the massacre of St. Bartholomew, a crime against both the unity of France and the rights of conscience, which broke his heart. He died Mar. 15, 1573.

HOPKINS, a co. in w. Kentucky, on Pond and Tradewater rivers, intersected by the St. Louis and Southwestern and the Paducah and Elizabethtown railroads; 400 sq.m.; pop. '70, 13,827—1869 colored. The surface is uneven and well wooded; soil fertile. Productions: tobacco, corn, pork, etc. Co. seat, Madisonville.

HOPKINS, a co. in n.e. Texas, drained by a branch of the Red river; 750 sq.m.; pop. '70, 12,651—1620 colored. The surface is prairie and woodland. Chief productions: corn, cotton, butter, and wool. Co. seat, Sulphur Springs.

HOPKINS, EDWARD, 1600–57; b. England; a London trader who came to New England in 1637 and settled at Hartford, where he was a magistrate, and governor of the colony every alternate year from 1640 to 1654. Later in life he returned to London, where he died. He left £1000 to support grammar-schools in Hartford and New Haven, and £500 to Harvard college and a school at Cambridge.

HOPKINS, ESEK, 1718–1802; b. R. I.; commissioned as a brig.gen in the revolutionary army, and in 1775 made a commodore and commander-in-chief of the new American navy. He went to sea in Feb., 1776, with four ships and three sloops, and took the forts at New Providence, with all the guns, ammunition, and stores. On his return he seized an English schooner and a bomb-brig. His later operations were less fortunate, and in Jan., 1777, he was dismissed from service for negligence. He was several times chosen to the Rhode Island general assembly.

HOPKINS, EZEKIEL, 1633–90; bishop of Londonderry; b. England. His early education was conducted under Presbyterian and Independent influences—a fact which threatened at first to mar his prospects of church preferment. Upon leaving Oxford, where he had been chaplain of Magdalen college, he was presented to the living of St. Mary Woolnoth, in London. When the great plague broke out in the capital, Hopkins withdrew to Exeter, where he obtained the living of St. Mary's. Here he married Araminta, a daughter of lord Robartes; and when that nobleman was made lord-lieutenant of Ireland, Hopkins went with him to Dublin, and through his influence obtained the deanery of Raphoe. In 1681 he was made bishop of Londonderry. In the famous siege of that town by the Irish adherents of James II., in 1689, Hopkins showed how completely he had outlived the influences of his early training by preaching with the most earnest zeal the doctrines of non-resistance. In the course of the siege he withdrew from the town, and retired first to Raphoe and afterwards to London, where he was made rector of St. Mary Aldermanbury. This charge he held until his death in June, 1690. His works, which have been frequently republished, comprise *Sermons, Expositions of the Decalogue and the Lord's Prayer,* and elaborate discourses on *Regeneration* and *The Vanity of the World.*

HOPKINS, JOHN HENRY, D.C.L., LL.D., 1792–1868; b. Ireland; came to the United States when a child, and received a classical education, and became an iron manufacturer in Pennsylvania. Not succeeding in business, he studied law, and began practice in Pittsburgh, but in 1823 he entered the ministry of the Protestant Episcopal church; in 1826, and again three years later, he was a delegate to a general convention, where he took a prominent part. In 1831 he accepted the charge of Trinity church, Boston, and the next year was chosen bishop of Vermont, taking also the rectorship of a church in Burlington. He took great interest in education, and made heavy pecuniary sacrifices for its promotion. After 1856 he devoted his whole time to the supervision of the diocese. Bishop Hopkins was a prolific writer, leaving nearly 20 published works, among which are *Christianity Vindicated; The Primitive Creed Examined and Explained; The Novelties which Disturb our Peace; History of the Confessional; The American Citizen, his Rights and Duties; A Scriptural, Ecclesiastical, and Historical View of Slavery,* etc. He was prominent in the Pan-Anglican synod in London in 1867.

HOPKINS, JOHNS, 1795–1873; b. Maryland; a member of the society of Friends; made a large fortune in trade; became a bank president and railroad director in Baltimore. He was never married. In 1873 he founded the Hopkins free hospital, an orphanage for colored children, and the splendid Johns Hopkins university, at an aggregate cost of more than $8,000,000. (See BALTIMORE.)

HOPKINS, LEMUEL, 1750–1801; b. Conn. He was a physician in Litchfield and in Hartford. He wrote satirical and political verses, such as *The Guillotine, The Political Greenhouse, The Hypocrite's Hope,* and *The Victim of a Cancer Quack.* He was one of "the Hartford wits" who wrote the *Anarchid* in advocacy of a strong federal constitution.

HOPKINS, MARK, D.D., LL.D.; b. Stockbridge, Mass., Feb. 4, 1802. He graduated at Williams college in 1824, was tutor there for two years, studied medicine, and after receiving his degree of M.D. began practice in New York. In 1830 he returned to the college as professor of moral philosophy and rhetoric, and held this chair till 1836, when he became president. The duties of this office he discharged for 36 years, holding also the professorship of mental and moral philosophy. In 1872 he resigned the presidency, according to a purpose long declared to retire at the age of 70 years; but he still retains the professorship of mental and moral philosophy. He received the degree of D.D. from Dartmouth college in 1837, and of LL.D. from the university of New York in 1857. In the latter year he became president of the American board of foreign missions. As a teacher of mental and moral philosophy he has impressed himself upon his classes, and given a high reputation to the college. In connection with his work he has published *Lectures on Moral Science; The Law of Love, and Love as a Law;* and *An Outline Study of Man.* As early as 1845 he delivered a course of lectures, on the Lowell foundation in Boston, on the Evidences of Christianity, which were published, and are ranked with the most important works of their class, and are used as a text-book in Williams and many other colleges. He has for many years conducted with the senior college class a weekly recitation in the Westminster catechism, which he makes a lecture and discussion with the students of the main truths of natural and revealed religion. He has long been pastor of the college church, and in his personal intercourse with the students has maintained a strong control together with genial relations of friendship. His administration of the college was remarkably successful, and he has been called by prof. A. P.

Peabody, of Harvard university, "the first of living educators." He has been eminent as a preacher and lecturer. His baccalaureate and other occasional discourses have been published, and many of them gathered in book form.

HOPKINS, SAMUEL, D.D., an American clergyman and founder of the Hopkinsian theology, was b. at Waterbury, Conn., Sept. 17, 1721. Having graduated at Yale college in 1741, he studied theology with Jonathan Edwards, and from 1743 to 1769 was settled as pastor of Housatonic, now called Great Barrington, Mass. He then removed to Newport, where he died Dec. 20, 1803. His writings consist of a life of president Edwards, sermons, addresses, a work on the millennium, and a system of theology, republished in Boston, 1852. He is said to be the hero of Mrs. Beecher Stowe's *Minister's Wooing*. He was remarkable for his simplicity, earnestness, and persevering industry, and his peculiar theological doctrines have been a source of controversy for a century.—HOPKINSIANS, those who adopt the theologiaal opinions of Dr. Hopkins, are not a distinct sect, but are pretty numerous in America, in some of the Christian bodies of which the tenets are generally Calvinistic. They hold most of the Calvinistic doctrines, and even in their most extreme form, but they entirely reject the doctrine of imputation, both the imputation of Adam's sin and of Christ's righteousness. The fundamental doctrine of the Hopkinsian system, however, is that all virtue and true holiness consist in *disinterested benevolence*, and that all sin is *selfishness*—the self-love which leads a man to give his first regard even to his own eternal interests being condemned as sinful.

HOPKINS, STEPHEN, LL.D., 1707–85; b. R. I.; a member of the colonial assembly in 1733, and in 1739 chief-justice of common pleas. In 1755 he was governor; in 1754, one of the commissioners to devise a plan for the union of the colonies. He took an early and active part in the movements for independence, and in 1774 was one of the colony's representatives in congress, where he served three terms. His signature to the declaration of independence is remarkable for its tremulous character, which is said to have been the consequence of a nervous affection. In 1765 he commenced a *History of the Planting and Growth of Providence*. Another work, published in London, was *The Rights of the Colonies Examined*.

HOPKINSON, FRANCIS, 1737–91; b. Philadelphia; graduated at the college of that city, of which he was the earliest pupil. He studied law, and after a brief visit to England took up his residence in Bordentown, N. J. In 1776 he was sent as a delegate to the continental congress. He wrote many sharp satires and popular poems, which did good work for the cause of liberty. In 1779 he was appointed judge of admiralty. On the organization of the federal government he was appointed district judge for Pennsylvania. Among his numerous satires the best remembered is *The Battle of the Kegs*. He was one of the signers of the declaration of independence.

HOPKINSON, JOSEPH, LL.D., 1770–1842; son of Francis; graduated at the university of Pennsylvania, and became celebrated as a lawyer. On the impeachment of judge Chase, Hopkinson was chosen for the defense, and his client was readily acquitted. Hopkinson was in congress in 1815–19 and in 1828 judge of the U. S. court. He is best known as the author of the words of *Hail Columbia* (which he wrote for the benefit of a player at a Philadelphia theater), and which were set to music known as *The President's March* and composed by a German.

HOPKINSVILLE, a city in Christian co., Ky., on the St. Louis and South-eastern railroad, 71 m. n.w. of Nashville; pop., 3,136. Among the public edifices are the court-house, seven churches, a state insane asylum, and a number of academies. There are also a number of manufactories in the city.

HOPLOPHORIDÆ. See GLYPTODON.

HOPPER, ISAAC TATEM, b. N. J., 1771; d. N. Y., 1852. His ancestors were of the religious society of Friends, but his grandfather was disowned for choosing a wife from another sect, and so he was not himself a "birthright member," but joined the society when he was 22 years of age. He was distinguished as a boy for his conscientiousness and courage, his fondness for animals, and an indomitable love of fun, which often betrayed itself in practical jokes of a very annoying character, and which in pleasanter ways he manifested even in his mature years. He was but 9 years old when he met an old negro who had been stolen from Africa when a little boy and sold into slavery. He listened to the old man's story with strong emotion, and, young as he was, made a solemn vow to himself that he would always be the friend of oppressed Africans. At 16 years of age he was apprenticed to an uncle in Philadelphia to learn the trade of a tailor. This was the golden age of Quakerism, and he fell under the influence of its most distinguished preachers and members. Even while he was an apprentice he began to be the helper of "slaves unlawfully held in bondage," of whom there were great numbers in Philadelphia. In early manhood he became an active and leading member of the abolition society founded by Franklin, Rush, and others, and in process of time was generally recognized in Philadelphia as the friend and legal adviser of colored people in all their troubles. He was also an overseer of a school for colored children, founded by the celebrated Anthony Benezet, secretary of a society for the employment

of the poor, inspector of a prison, guardian of abused apprentices, and a friend of the insane. In these various forms of philanthropic labor he exhibited such courage, tact, and devotion that he won the confidence of all his associates. In the division of the society of Friends, which occurred in 1827–28, he acted with those who were called "Hicksites," influenced much, no doubt, by his great regard and admiration for Elias Hicks as an earnest anti-slavery preacher; and in 1829 he came to New York and opened a Friends' bookstore. In 1830 business called him to Ireland, and he went with letters of commendation from many of the most eminent citizens of Philadelphia. Matthew Carey wrote to him in terms which he well knew would be the surest passport to popular favor on the other side of the Atlantic. "I have been well acquainted with you," he said, "about 35 years, and I can testify that, during the whole of that time, you have been a perfect pest to our southern neighbors. A southern gentleman could scarcely visit this city without having his slave taken from him by your instrumentality; so that they dread you as they do the devil." His personal resemblance to Napoleon Bonaparte was so striking that it attracted general notice. Joseph Bonaparte, who knew him well, expressed the opinion that if he were to appear in Paris, dressed in the emperor's uniform, nothing could be easier than for him to excite a revolution. Mr. Hopper, naturally enough, was among the first to join the anti-slavery movement organized by Garrison in 1831. His life was often imperiled in his efforts in aid of fugitive slaves; and as for reputation, such was the state of public sentiment in New York from 1831 to 1845 that he was often denounced in public as well as private. Even the society of Friends shrank from defending him. More than once he was called upon to defend himself in the courts, but every attempt to bring him under the grasp of the law failed. In such cases he refused to employ counsel, relying confidently upon his own knowledge of the law and his ability to defend himself. Once, when he was accused, the court, impressed by the gravity of the case, earnestly advised him to engage a lawyer. "Does the court," he asked, "understand the law?" "Yes," replied the judge. "Well, then," said the imperturbable Quaker, "what need have I of counsel? The court understands the law and I understand the facts; is not that enough?" His accusers never dared to bring the case to trial. He visited the court many times, demanding to be tried, and at length the case was dismissed. Bowie-knives and pistols were more than once used by slave-hunters to frighten him, but in vain. During the pro-slavery riots of 1834 a friend advised him to remove the anti-slavery pictures from the window of his store. "Dost thou think," he replied, "I am such a coward as to forsake my principles or conceal them at the bidding of a mob?" When the mob came down the street with discordant yells, he walked out and stood upon the steps. As they stopped before his door, he looked at them with a courage and dignity so impressive that they were utterly abashed. Once he was knocked down in the street and savagely beaten by a slave-hunter's agent, who approached him from behind; but this did not in the least abate his zeal. In 1840 he was appointed treasurer and office agent of the American anti-slavery society. The society of Friends was then under the control of a party opposed to any active hostility to slavery. This party, offended by the criticisms of the *National Anti-Slavery Standard*, for which Mr. Hopper was in no way responsible, arraigned and disowned him for "being concerned in the publication and support of a paper calculated to excite discord and disunity among Friends;" in other but less ambiguous terms, for being an abolitionist. In 1845 the society removed its head-quarters to Boston, which necessitated the retirement of Mr. Hopper from a post which he had filled for five years. He was now almost 70 years old, but full of bodily and mental vigor, and he gave the last years of his life mainly to the service of the New York prison association, in the organization of which he took an influential part. It was mainly through his personal influence indeed that the act of incorporation was secured. For ten years he was the active agent of this society, often visiting the prison at Sing Sing and addressing the prisoners in a way calculated to inspire in them a purpose to lead better lives. He was the friend and counselor of discharged convicts, finding employment for such as manifested a purpose to reform, and trying to keep them out of temptations which they had not the strength to resist. In this field of benevolence his ripe judgment, rare tact, and true sympathy for the unfortunate found ample exercise. The institution for discharged female convicts was named, in his honor, "The Isaac T. Hopper Home," and has been administered from that day to the present by his daughter, Mrs. Gibbons. When he died, widely honored and lamented, the society of Friends offered a place for his remains in their cemetery; but his burial was in Greenwood cemetery, his children remembering that the society had excommunicated him, and deferring to his own express desire. Mr. Hopper was twice married, and 10 of his 16 children survived him. His life, by Mrs. L. Maria Child, was published in 1853.

HOPPIN, Augustus, b. R. I., 1828; graduated at Brown university, 1848. Disliking the legal profession, which he had selected in the first instance, he turned his attention to art and went abroad to study paintings and engravings. Upon his return he devoted himself to drawing and to the illustration of books, in which he has for years attained great popularity. His pictures in *Nothing to Wear*, *Potiphar Papers*, and *The Autocrat of the Breakfast Table* are widely known.

HOPPIN, JAMES MASON, D.D., b. R. I., 1820; graduated at Yale, and took a theological degree at Andover. In 1861 he was made professor of homiletics in Yale college. He was for many years pastor of Crombie-street church, Salem, Mass. Among the works he has published are *Old England, its Art, Scenery, and People; The Office and Work of the Christian Ministry;* and *Notes of a Theological Student.*

HOPS. The produce of the hop-plant (see HOP). The fruit is a little nut, not larger than a grain of mustard-seed, and between its outer shell and the kernel there is a small quantity of a peculiar granular substance called *lupuline*, which also exists as a sort of efflorescence on the surface of the scales themselves; much of the value of the hop depends upon the abundance of this substance. The *lupuline* is not a mere powder, but each grain is a little organized cellular body, of an oval or round form, and, when seen under the microscope, having a reticulated surface. These lupulinic grains have been analyzed by many chemists. The following is the result of the investigations of Payen, Chevallier, and Pelleteau:

Volatile oil (oil of hops)	2.00
Lupuline (the bitter principle)	10.30
Resin	50 to 55.00
Lignin	32.00
Fatty, astringent, and gummy matters; osmazome, malic and carbonic acids, several salts (malate of lime, acetate of ammonia, chloride of potassium, sulphate of potash), etc.	Traces.
	99.30

The first year the bines, or stalks, are weak, and have to be provided with poles. When the bines die down in autumn, they are cut off, and the sticks removed or stacked, and during the winter the ground is forked over and manured. The plants are in perfection the third year, when each requires a pole about 18 or 20 ft. in height, to which the young bines are tied as they grow, with rushes or bast. They, however, soon begin to twine around the poles, and then require no more tying. In the English hop-grounds, the picking begins about the middle of September. This is done by women and children chiefly, some men being necessary to lower the poles and bring the hops within reach. As the hops are picked, they are taken to the *oast*, or hop-kiln, in which they are dried, usually on horizontal screens of hair-cloth, through which the heat of the kiln passes. This operation requires to be performed with great care, as the essential oil is very liable to be volatilized, especially as the hops are frequently kept from year to year. When fully dried, they are carried to the packing-house, and are there pressed into the bags or pockets, and sewed up ready for sale.

The best varieties of the hop are the hill Golding, the East Kent Golding, golden hops, Jones's hops, grape-hops, and Farnham white bine.

The Goldings are the best and richest, and are used for the finest ales. The Joneses are most valued for their habit of short growth, which enables the grower to use shorter poles. The Colegates are very hardy, and can be grown on a poorer soil than the others. The grape-hops are also very hardy, and will do on an indifferent soil; they are also very prolific.

We also receive them of excellent quality from Canada and the United States. Until the year 1862 hops paid an excise duty, and formed an important part in the revenue, although a very variable crop, owing to the serious check it is liable to from insects, fungi, diseases, and the weather. In 1876 the land under hops in England amounted to 69,999 acres, of which nearly 45,000 were in Kent, and most of the remainder in Sussex, Hereford, and Hampshire. The annual exportation of hops is about 40,000 cwt., chiefly to the United States and Australia.

In a carefully conducted experiment, Dr. Ives obtained 14 ounces of lupuline from 6 pounds of hops; and as he was sure that he had not removed it all from the scales and nuts, a fair conclusion was drawn that the lupuline constitutes a sixth of the whole weight of the best hops. Both the bitter taste and the preservative character of hops are supposed to depend entirely upon this material, whether in the form of fully developed lupuline grains, or diffused in an undeveloped state in the structure of the scales. It is, therefore, of the utmost importance not only to encourage the development of the lupuline by good cultivation, but it is equally desirable to make the best use of it when produced. In furtherance of this, many of the principal English brewers now use an ingenious machine made by Mr. Handyside of Derby, which first shakes off and sifts out the lupuline grains, and then separates the nuts or seeds from the scales. The reason for this separation is this: Experience has shown that much of the aromatic principle of the lupuline is dissipated at a boiling heat; therefore only the scales are so treated, whilst the free lupuline is mashed with lukewarm wort, and the nuts, after being crushed, are treated in the same manner, and all are added together when cold. By this means the aroma is fully developed, and a smaller quantity of hops is found to answer fully.

There is a narcotic principle in hops as well as the bitter and tonic, all of which have led to their employment in medicine. Such use is, however, very limited. For the full details of their employment in the process of brewing, see BEER.

HOP-TREE, *Ptelea trifoliata*, an American shrub of the rue family, called also *shrubby trefoil, wafer ash,* and *wingspeed,* growing in rocky places from Pennsylvania to Wisconsin and southward. It usually grows from 6 to 10 ft. in height, but when well trimmed and cultivated sometimes attains a height of 30 ft. or more. Leaves, trifoliate; leaflets, ovate and pointed, and downy when young; flowers, in terminal cymes on new shoots, greenish, small; polygamous—staminate, pistillate, and perfect ones being on the same plant; fruit, 2-celled, 2-seeded, having a broad wing resembling that of the elm (*ptelea.*) The fruit is very bitter, but does not possess the aromatic principle of the hop (*humulus lupulus*). The flowers have a disagreeable odor; the fruit has been used, it is said, in making beer. The bark and root are the parts used in medicine. When dried it has a peculiar, somewhat aromatic smell and a bitter, pungent acrid taste. Dr. Potter considers it, in the form of a tincture, a valuable remedy in dyspepsia and low fevers connected with gastric irritation. The bark as analyzed by Mr. Steer contains an acrid, bitter oleo-resin; starch; albumen; a yellow coloring substance; and salts of lime, potassa, and iron; also the alkaloid *berberin,* probably the tonic principle.

HOR, a mountain of Arabia Petræa, on the confines of Idumæa, and forming part of the mountain of Seir or Edom. It is generally regarded as the modern *Jebel Haroun,* or Mount Aaron, lying midway between the Dead sea and the Elanitic gulf. On the summit of this hill is a tomb venerated by the Mohammedans as the sepulcher of the high-priest Aaron.

HORÆ, or THE HOURS, who in ancient fable had charge of the gates of heaven, and are variously represented. According to Hesiod they watched over the works of men, while an unknown poet claims for them the distribution of time and calls them the children of the year. Probably they were originally three in number, on that account answering to the three periods into which the early Greeks divided their year. And later on, when the day came to be definitely apportioned into 12 hours, the poets sung of an equal number of Horæ as the guardians of those portions of time. As guardians of the seasons with their regular alternations, they soon came to be looked upon as representatives of the moral qualities, and Hesiod immortalized them as presiding over law, justice, and peace, and as diffusing harmony and order among men. Homer allegorically represents them as ministers of Jupiter and rulers of storm and cloud. They attended the goddesses at the Olympic festivals, and showered blessings upon mortals. The Hora of spring is represented in sculpture as attendant upon Venus when she sprang from the foam, and of Proserpine when she returned from the lower regions.

HORA'TIUS FLACCUS, QUINTUS, the renowned Roman satirist and lyrist, was b. at Venusia, in Apulia—in the country now called the *Basilicata,* lately forming part of the kingdom of Naples—on Dec. 8, 65 B.C. His father, who had been born a slave but manumitted before the poet's birth, was a *coactor* (a collector of money for tax-gatherers and bankers), by which employment he had become a proprietor on a modest scale in his native district. Early seeing the genius and promise of his son, he resolved to devote his whole means to his education, and removing to Rome for the purpose, he gave him the culture usually bestowed on the children of the highest classes. Having finished his youthful studies at Rome, he was engaged on higher ones at Athens, when the assassination of Julius Cæsar threw the whole Roman world into confusion, and dragged Horatius himself—in his 21st year—into the civil war which followed. Brutus, coming with Cassius to Greece, made Horatius a tribune, and he served with the republican leaders in that rank until the fatal field of Philippi put an end to their campaign. Brutus and Cassius destroyed themselves. Horatius made his submission, and returned to Rome. With what was left of his patrimony he bought the office of public scribe, and while living by this humble place devoted his energy to literary creation. Thoroughly accomplished in Greek and Roman literature, he set himself to two great tasks—the naturalization in Latin of the Greek lyric spirit, and the perfect development of the old Roman satire. It is his complete artistic success in both objects which has made him one of the most influential writers of the world, and which will secure his fame as long as order or culture exists upon the globe.

Horatius's first known labors were satires and epodes—the epodes being imitations of the Greek satirist Archilochus. But it is probable that he early began to imitate the other Greek lyrists; and it is certain that his first success was derived not from the public but the private circulation of his works. He made the friendship of Virgil, whose rise preceded his own, and of Varius; and Virgil and Varius introduced him to Mæcenas when he was about 26 years old. That great Etruscan noble and friend of Augustus became the good genius of the poet's life. He endowed him—at some period not exactly known, but before 33 B.C.—with a farm near Tivoli, in the Sabine country, established his independence, fostered his fame, sought his intimacy, loved, honored, and encouraged him as much as one man could another. The friendship of Mæcenas led to that of Augustus, and Horatius enjoyed all his life (he died at 57) the consideration of the greatest persons of his time. He shows his gratitude for such favor in many passages of his poems, but he is never servile, and he compliments the emperor himself only on those features of his reign which have tended to secure him the gratitude, or, what was not less needed, the forgiveness, of posterity.

It is impossible, in our brief space, to discuss the vexed question of the chronology of Horatius's poems, or to notice a fiftieth part of what has been written on it. But if we cannot be sure of the chronology of the poems, they give us themselves ample means for judging of the character of the poet. Even his personal appearance is familiarly known to us. He was a little, round, dark-eyed man, prematurely gray-haired, and inclined to corpulence; in dress somewhat slovenly, and apt to be abstracted in his gait and manner. He was kindly, friendly, and honorable—irascible, but easily appeased—of amorous and generally sensual temperament, yet fully sensible of both the dignity and the prudence of moderation. His philosophy was Epicurean, like that of most Roman men of the world of his age; but he had both an eye and a heart for the noble in history and in life, and his most discerning readers cannot but see that there was a latent fund of earnestness and even piety in his nature, to which his poetry never gave full expression. The real key to his genius is to study him as essentially a philosophical wit and moralist, who had an exquisite faculty for lyrical creation, and was a finished artist by dint of practice in it, but who primarily belonged to the philosophical rather than to the poetic class of minds. Some strict modern critics have doubted his being a poet at all, which, since he could produce all the effects of poetry, is plainly nonsense. The latest criticism, however, decidedly tends to place his lyrical works—as imitations of the Greek, and echoes of the natural notes of an earlier and more poetic age—farther below his *Satires* and *Epistles* than it was once customary to rank them. Meanwhile, this neither robs the *Odes* of their value, nor of their charm, nor of their merit. Their value, as representing an older literature which only exists in fragments, is immeasurable. Their charm, as breathing now all the gayety, now all the sadness, of the ancient pagan mind, is irresistible. And their merit, even as imitations, implies a delicacy of insight, a fineness of touch, a power of minute finish, which has been exhibited by very few writers in the whole history of art. They are, indeed, perpetual models of construction, equally valuable to poets of every school, and were not less carefully studied by Wordsworth than by Pope. Great, however, as is the merit of the *Odes*, that of the *Satires* and *Epistles* is still higher. The native Roman satire—an indigenous product of Italy, as Casaubon has irrefragably established—was developed by Horatius into a branch of composition peculiarly his own, and in his own species of which he has never had a rival. He ridicules the follies of the world from the point of view of a man of the world, playing round vice like a picador round a bull; and though his morality does not rise above the level of a prudential moderation abhorrent of extremes, he enforces this with so much soundness, dramatic liveliness, and gay, vivacious humorous wit, that the pulpit has profited by him not less than the author's study, and he has been the favorite of ecclesiastical dignitaries and statesmen, while also being the pocket-companion of men of letters and epigrammatists. The *Epistles* contain the graver element of the *Satires* in still greater perfection, and with the addition of a fine vein of personal emotion and affection, tinged occasionally with the melancholy of advancing life, which, on the whole, makes them the most valuable of Horatius's works.

The literature of Horatius in modern Europe is enormous, and can only be glanced at here in the briefest manner. The *Editio Princeps* appeared at Milan in 1470, in 4to, and was followed by a long line of editions. In modern times, Orelli has taken a leading place as Horatian editor, and since him, Dillenburger has been justly popular; while England has contributed to the subject, among many other works, the valuable *Horatius Restitutus* of Tate, and the sumptuous volume of Dean Milman. Among the English translators of Horatius, in the whole or in part, are found Ben Jonson, Milton, Atterbury, Pope, Warren Hastings, and Cowper, while Pope's *Imitations* occupy a distinguished place of their own. The best known translation of the whole of Horatius in English is that of Francis, but his day is fast going by. Excellent translations have been issued in our own time by Mr. Martin, Mr. Robinson, lord Ravensworth, lord Lytton, and prof. Conington; and a curious but powerful one by prof. Newman, whose theory of translation, however, has led him into frequent oddities and singularities.

HÖR'DÉ, a t. of Prussian Westphalia, on the Emsche, 33 m. s. from Münster, with which it is connected by railway. Near it are productive coal-mines, and the town has recently increased with great rapidity. Nail-making is carried on. Pop. '75, 12,852.

HOR'DEIN, a term that has been applied to a substance that can be extracted from barley, but which is merely a mixture of starch, cellulose, and a little nitrogenous matter of unknown composition.

HOR'DEUM. See BARLEY.

HO'REB. See SINAI.

HOREHOUND. See HOARHOUND, *ante*.

HORGEN, or HORCHEN, a t. in Switzerland, on the lake of Zurich, 7 m. s. of Zurich city; pop. '70, 5,311. The main business is manufacturing of cotton and silk goods and chemicals.

HORICON LAKE, in Dodge co., Wis., extending into Fond du Lac co.; about 15 m. long and 5 m. wide; finding its outlet through Rock river into the Mississippi. It is shallow, and water-plants flourish on its surface.

HORICON, LAKE. See GEORGE, LAKE.

HORITES, descendants of Hori, grandson of Seir, a people who dwelt in and around Mt. Seir before the Canaanites took possession of Palestine. The Scriptures give their genealogy, and say that they were divided into seven tribes. They were smitten by Chedorlaomer and the kings of the east, when they invaded Sodom in the days of Abraham. They were overcome, and perhaps absorbed by the Edomites, who adopted their habits. They lived in dwellings excavated in the sandstone cliffs, and the ruins of their homes, especially in the Petra, are among the most remarkable of ancient remains.

HORIZON, the circular line formed by the apparent meeting of the earth and sky; this, in astronomical phrase, is called the *sensible horizon*. The *rational horizon* is the circle formed by a plane passing through the center of the earth, parallel to the sensible horizon, and produced to meet the heavens.

HORN, CAPE See CAPE HORN, or HOORN.

HORN, a musical instrument, commonly called in this country the French horn; in Italy, corno; in France, cor de chasse. Its form is that of a long tube of brass, with a large bell-shaped ending. For greater convenience the tube is coiled up into four continuous circles, lying side by side, the coils being soldered together, to keep them in their position. It is sounded by means of a mouth-piece, in form like a little hollow cup. The thinner the sheet-brass is, of which the horn is made, the more easily can the sound be produced. The sounds obtained on the horn are the harmonics of the sound of its whole length, a fundamental sound which cannot be produced by the mouth. As those sounds form only a limited scale, the notes awanting are artificially made, by the hand being inserted into the bell, so as to flatten a higher note down to a lower one. These flattened notes are called stuffed notes, as the sound of them is muffled. The horn, in its natural state, can only be played in one key; but by means of crooks, which are added to increase the length of the tube, it can be transposed into any key. When at its greatest length, the horn measures, from the mouth-piece to the end of the bell, 16 feet. The music for the horn is always written in the key of C, with the key of the composition marked at the beginning of each movement; thus, corno in D, etc., guides the performer as to the crooks he must use, in order to play the notes in the key indicated. The stuffed notes on the horn being very defective in quality of sound, in comparison with the great beauty of the open notes, many inventions have been, from time to time, tried to remedy them. The most successful invention is the valve-horn, which is constructed so that the performer can, by means of three valves, lengthen or shorten the tube, so as to produce any note in the chromatic scale, as a harmonic of the length of the tube, and consequently all of the notes are of the same quality of sound, and open notes. The valve-horn is now generally used as a solo instrument with greater effect than the common horn. As an orchestral instrument, the horn is of great importance. There are never less than two horns in an instrumental score, and in many great works four horns are absolutely necessary. The date of the invention of the horn is lost in antiquity.

HORN, GUSTAF CARLSSON, 1592–1657; b. Sweden; educated at Tübingen, and was trained in military science in Holland under prince Maurice. He took service in the army of Sweden in 1624, and participated in all the victories of Gustavus Adolphus, who called him his "right arm." After the battle of Lützen, Horn conducted the successful campaign in the Rhenish provinces, but at the battle of Nördlingen he was captured and detained a prisoner for seven years. When at last he was liberated by exchange, he joined in the campaign against the Danes, and in 1651 was made a field-marshal.

HORN, or HOORNE, PHILIP II. DE MONTMORENCY-NIVELLE, Count of, 1522–68; a Dutch nobleman who was murdered by the duke of Alva. While he was still a boy, his mother married, a second time, John, count of Horn, and, through his influence, Philip was nominated governor of Zutphen by the Spanish king. He also became admiral of the Flemish fleet, and councilor of state. He distinguished himself at St. Quentin and Gravelines. After spending many years in Spain, he returned to his native land, and joined Egmont in resistance to the policy of Philip. He resisted the introduction of the inquisition into Holland. He was tolerant in principle, and on one occasion used his influence in preventing a massacre of Roman Catholics at Tournay. He struggled vainly against the oppressive measures of Philip and of Margaret, regent of the Netherlands. Philip, desiring at last to rid himself of Horn, Egmont, and others of their party, sent the infamous duke of Alva to Holland as his representative. Alva enticed Egmont and Horn into the city of Brussels and had them arrested. They were summarily brought to trial and executed.

HORNBEAM, *Carpinus*, a genus of the natural order *cupuliferæ*; consisting of trees with compact, tough, hard wood; bark almost smooth and of a whitish-gray color, deciduous leaves, and monœcious flowers. The male catkins are cylindrical and sessile, their flowers consist merely of a little scale-like bract and 12 to 24 stamens. The female flowers consist of a germen, crowned with the 4- to 8-toothed border of the perianth, and with two thread-like stigmas, and are placed in loose slender catkins, always two

together, each at the base of a stalked bract, which is three-cleft or three-cornered, and which, when the tree is in fruit, enlarges very much, becomes leafy, and covers the fully ripened nut on one side. The nut has a thick husk, and is small and striated. The COMMON HORNBEAM (*C. betŭlus*), very frequent in the woods of many parts of Europe, is a beautiful tree, attaining a height of 60 to 100 feet. It is seldom, indeed, now seen of such dimensions in Britain; but it seems to have formed a principal part of the ancient forests of some parts of the island. It has elongato-ovate, acuminate, almost triply-serrate leaves. When in fruit, it has very large, deeply 3-partite bracts. It thrives best in a moderately moist and shady situation. Its root descends deep into the ground. The wood is white, very hard, uncommonly strong and tough, and therefore suitable for bearing heavy strains. It is much used by joiners, turners, and wheelwrights. It takes a very fine polish, and, when well stained, might readily be mistaken for ebony. In the earth, or where exposed to the changes of the weather, it is of no great durability. It burns like a candle, and it is one of the best kinds of firewood; it affords an excellent charcoal, and the ashes yield much potash. The young stems, by reason of the dense growth of their twigs, are very suitable for forming live-fences and bowers; and as it bears clipping very well, the hornbeam was often employed to form those live-walls which were formerly so much the fashion in gardens.

HORNBILL, the name of a genus (*buceros*) and of a family (*bucerotidæ*) of birds, to which Cuvier assigned a place in the syndactylous division of the order *insessores*, but which some naturalists rank with crows in the tribe *conirostres*. Their anatomical structure has been found to indicate affinities both with crows and toucans, and the same inference may be drawn from their habits. The species are numerous; they are natives of Africa and the East Indies. They are mostly large birds, some nearly as large as a turkey, the smallest rather smaller than a magpie. They are remarkable for the enormous size of the bill, and for a large bony protuberance with which it is generally surmounted. The bill is curved, broad at the base, compressed towards the tip; the bony protuberance on the upper mandible assumes different forms in different species. They may be described as omnivorous.

HORN'BLENDE, a mineral allied to augite (q.v.), and containing from 40 to 60 per cent of silica, with variable quantities of alumina, lime, oxide of iron, soda, potash, and fluorine. Hornblende is found in granite, syenite, and other igneous rocks which contain quartz or free silica. It is particularly abundant as a constituent of syenite. It is sometimes found in considerable masses, and even in beds of slaty structure (*H. slate*). The variety called COMMON HORNBLENDE is generally green or black, more rarely brown or gray. It contains a pretty large proportion of protoxide of iron; is generally massive, but sometimes crystallizes in oblique four-sided, or in six-sided prisms. The crystallized hornblende is sometimes called *black schorl*, and is capable of being made into ornaments.

HORNBOOK, the primer or apparatus for learning the elements of reading, used in England before the days of printing, and common down to the time of George II. It consisted of a single leaf, containing on one side the alphabet large and small, in black-letter or in Roman, with perhaps a small regiment of monosyllables. Then followed a form of exorcism and the Lord's prayer, and, as a finale, the Roman numerals. The leaf was usually set in a frame of wood, with a slice of transparent horn in front—hence the name of *horn*-book. There was a handle to hold it by, and usually this handle had a hole for a string, whereby the apparatus was slung to the girdle of the scholar. Sometimes the leaf was simply pasted against a slice of horn. At first, the leaf was of vellum, with the characters in writing; latterly, of paper, and printed. The hornbook was prefaced and otherwise ornamented with figures of the cross, and hence came to be often called Christ cross row, or Criss cross row. Common as hornbooks at one time were, copies of them are now exceedingly rare. One, found some years ago in pulling down an old farmhouse at Middleton, in Derbyshire, had a portrait of king Charles I. in armor on horseback upon the reverse, affording us an approximation to the date. In *Notices of Fugitive Tracts*, printed for the Percy society (1849), Mr. Halliwell figures a more perfect specimen, which he assigns to the time of Elizabeth. Allusions to the hornbook abound in the older writers; Shenstone, e.g., in *The Schoolmistress*, tells us of the children, how

> Their books of stature small they take in hand,
> Which with pellucid horn secured are,
> To save from fingers wet the letters fair.

HORN'CASTLE, a market-t. of England, in the county of Lincoln, is situated in an agreeable district at the foot of the Wolds, 20 m. e. of Lincoln. The parish church is the most interesting of the public buildings; portions of it were erected during the reign of Henry VII. There is a considerable trade here in corn and wool; and of the three annual fairs, that held in Aug. lasts for ten days, and is one of the largest horse-fairs in Britain. There are at Horncastle remains of a Roman fortification; coins and other antiquities are occasionally found in the neighborhood. Pop. '71, 4,865.

HORNE, GEORGE, 1730–92; b. England; educated in the school of Maidstone, whence he passed to university college, Oxford. He afterwards became a fellow, and finally principal, of Magdalen college. In 1771 he was chosen chaplain in ordinary to

the king, and held that office for ten years. In 1776 he became vice-chancellor of the university; five years later he was made dean of Canterbury; and in 1790 was promoted to the see of Norwich, which he retained till his death. Bishop Horne's only important work, his *Commentary on the Psalms*, exhibits a deep acquaintance with Hebrew and biblical lore, and is marked by a spirit of earnest piety. It has been frequently reprinted. His other works, for the most part fugitive pieces of a controversial character, are now forgotten. The best of them were written to defend the views of Hutchinson in opposition to those of sir Isaac Newton, which latter, until he understood them thoroughly, he at first believed at variance with Scripture and subversive of its teachings.

HORNE, Richard Henry, b. London, 1803; receiving a military education, served in the first instance as a midshipman in the Mexican navy until the conclusion of the war of independence. Then returning to England, he devoted himself to literature and wrote several tragedies, many of them with ironical and sarcastic meanings. In one of his books, *Orion, an Epic Poem*, he announced on the title-page that the price was one farthing, in allusion to the public depreciation of epic poetry. This satire obtained a ready sale and went through three editions, each of which increased it in price. Tiring of English life, Horne went to Australia; and afterwards published *Australian Facts and Principles*. He is a prolific writer and contributor to many of the periodicals.

HORNE, Rev. Thomas Hartwell, d.d., an English biblical critic, b. Oct. 20, 1780, was educated at Christ's hospital, and afterwards became clerk to a barrister. His leisure hours were devoted to the study of the Bible, and in 1818 he published his *Introduction to the Critical Study and Knowledge of the Holy Scriptures*, a work which procured for him admission into orders without the usual preliminaries. Subsequently St. John's college, Cambridge, granted him the degree of b.d., and two American colleges that of d.d. In 1833 he obtained the rectory of St. Edmund the King and St. Nicholas Acons, London. He was also made a prebendary of St. Paul's cathedral. In the course of a long life, Horne published a great variety of works, but the one already mentioned is the principal. From the first moment of its appearance, it not only became popular, but attained the dignity of being considered the text-book on the subject in all or almost all the theological colleges of Great Britain and America. It has gone through eleven or twelve editions, and has been frequently improved, so that it still retains the high reputation which it originally bore. He died Feb., 1862.

HORNED FROG, or Horned Toad, a lizard of the genus *phrynozoma*. It has some resemblance to a toad or a frog, but is not a batrachian, but a saurian. The genus comprises about a half-dozen species, all North American, the best known of which are *P. Douglassii*, *P. Blainvillii*, and *P. cornutum*. Capt. Stansbury's *Expedition to the Great Salt Lake* contains full descriptions of them by Messrs. Baird and Girard. The name horned frog has also been given to a batrachian of the genus *ceratophrys*, which has a spiny head. It is a native of tropical South America, and is three or four times as large as a common frog, and feeds upon other frogs, small birds, rodents, and mollusks.

HORNED POUT. See Catfish.

HORNELLSVILLE, a village in the t. of the same name in Steuben co., N. Y., on the New York, Lake Erie, and Western railroad, and on Canisteo river, 60 m. s. of Rochester; pop. of township, 8,879. The village has six churches, a convent, a public library, four newspapers, a free academy, a business college, and many manufactories.

HORNER, Francis, 1778–1817; b. Scotland; educated at the Edinburgh university, and started in the practice of law. He contributed in early life to the *Edinburgh Review* some very able papers. In 1806 he was elected a member of parliament, and siding with the whigs became renowned in debate on questions of finance and political economy. He was in favor of free trade and metallic currency. He took a leading part in the great bullion question, and drew up the first report on the subject. It was mainly due to his influence that restrictions were placed upon the issue of paper money. In private life his character stood extremely high. Sidney Smith said of him: "The commandments were written on his face, and I have often told him that there was not a crime he might not commit with impunity, as no judge or jury who saw him would give the smallest degree of credit to any evidence against him; there was in his look a calm, settled love of all that was good and honorable, an air of wisdom and sweetness; you saw at once that he was a great man, whom nature had intended for a leader of human beings; you ranged yourself willingly under his banner, and cheerfully submitted to his sway."

HORNER, William Edmonds, 1793–1853; b. Va.; graduated at the university of Pennsylvania, and became a surgeon in the U. S. navy. He subsequently practiced medicine in Philadelphia with great success. He was prosector and demonstrator of anatomy in the university of Pennsylvania, and adjunct professor of anatomy in 1819, and full professor in 1831. In 1847 he founded St. Joseph's hospital. In 1824 he announced the discovery of the muscle known as "Horner's muscle." He published a number of medical works, including *Pathological Anatomy; Practical Anatomy; Special Anatomy and Histology; The United States Dissector;* and an *Anatomical Atlas*.

HORNET, *Vespa crabro*, the largest species of wasp found in Britain. It is not uncommon in some parts of England, but is not found in Scotland. The thorax is

mostly black, the fore-part rufous; the abdomen is yellow, with three brown points on each segment. The sting is very painful. The hornet is a very voracious insect, seizing and devouring bees and other insects, and carrying them to its nest to feed its young. The nest is in a hollow tree, in an outhouse, or in some other sheltered place. The community is not supposed ever to contain more than about 200 individuals, all deriving their origin from a single female, which, having survived the winter in some sheltered hiding-place, lays the foundation of the nest in spring. The nest is a curious structure, of a substance resembling coarse paper, and, except as to size, pretty similar to that of the common wasp. The community consists of females, males, and neuters or workers, as in the case of bees, but there are numerous females. Most of the males and neuters perish on the approach of winter, some of the females alone surviving.

HORNING, LETTERS OF, a writ in Scotch law, which issues to compel a party to execute or carry out a judgment or decree of the court. The writ was formerly the only form of enforcing civil decrees by imprisonment, except in the case of small debt decrees. But by recent improvements the process is shortened, and other forms are more used.

HORNITOS, or HORNOS (Span. *ovens*), the name given to the low oven-shaped hillocks which emit smoke and vapors, and which occur in great numbers on the sides and in the neighborhood of the large volcanoes of South America.

HORN MANUFACTURES. The horns of various animals are employed for useful and ornamental purposes. The principal are those of the ox, buffalo, and two or three species of deer, and of sheep and goats. Horn can be softened and split into thin laminæ, or pressed into molds; and as it recovers its peculiar character of flexibility, toughness, and transparency, when cold, it is particularly adapted for a great variety of purposes. It can also be dyed various colors. Solution of gold in aqua regia dyes it red; solution of nitrate of silver in nitric acid, black; a paste of red lead, made with a solution of potash, colors it brown: so that, with a proper arrangement and application of these materials, the most admirable imitations of the much more costly tortoise-shell can be produced. The more common vegetable dye-stuffs, as logwood, Brazil-wood, barwood, saffron, indigo, etc., will also color it, but neither so permanently nor so brightly as the metallic materials. By long-continued soaking, the horns of all the animals above mentioned, except the deer, can be softened, and those of the sheep and goat can be easily split into several layers when they have been soaked and boiled; and these layers cannot only be flattened out by putting them between smooth iron plates heated and placed in a press, but if the edges of two or more are brought together between polished copper plates, and these tightly screwed together with a hand-vise, and plunged for some time in boiling water, and then into cold water, the edges will be found firmly welded together, and the same property enables the horn-worker to use up the smallest cuttings with profit. Another valuable property of horn is that when heated it can be pressed into a die, and not only takes a beautifully sharp impression, but if left in the die until cold it retains it. In this way, then, it is employed in making handles for umbrellas, knives, forks, etc., even ornamental boxes, and a variety of other articles. Combs are made out of the flattened sheets, and beautiful carvings are made out of the solid parts of the buffalo-horns brought in such vast numbers from the East Indies. Ox-horns, too, are sometimes of fine quality and color, and are fashioned into drinking-cups and other articles, often highly ornamental. Deer-horns, which, strictly speaking, are bone, have a very limited application; they are employed in this country for making knife-handles, called buck-horn, in much favor for pocket-knives; but on the continent the horns of the fallow-deer are extensively used in making the deer-horn articles of furniture peculiar to Germany. The deer-horns used in Great Britain are chiefly those of the axis (*axis maculata*), of which at least 100,000 are annually imported from the East Indies. From the same country are brought to Britain 800 tons of buffalo-horns, whilst from South America and other parts the importation of ox and cow horns exceeds a million annually.

HORNPIPE, a musical instrument, consisting of the common wooden pipe with the necessary holes for producing the notes, and with a horn on each end. The performer blows into one of the horns, and the sounds of the pipe proceed out of the other. In the n.w. of England, where this instrument is mostly found, it is used to accompany a national dance which is also called the hornpipe. The melody of this dance is always in triple time—that is, in $\frac{3}{2}$ or $\frac{3}{4}$, and sometimes in $\frac{3}{8}$ time—and it consists of two parts of four or eight bars each, with repeats. The movement of the dance is tolerably quick.

HORNS are appendages to the frontal bones of many of the extensive family of ruminants, and are obviously intended as weapons of defense. In the genus *cervus* (deer) the horns (known also as antlers) are solid, uncovered by epidermis, bone-like in composition, and deciduous. In the genus *camelopardalis* (the giraffes) we have the single example of solid persistent horns completely invested with a hairy integument. In the other horn-bearing ruminants—as the ox, sheep, goat, and antelope—the horns are hollow, uncovered by epidermis, are composed of a special tissue (Horny Tissues, q.v.) quite different from bone, and are persistent. In all these cases the horns are attached to the cranial bones; and in all the hollow horns, excepting those of the ante-

lope, the osseous axis is hollowed out into cells communicating with the frontal sinuses, and thus admitting the atmospheric air into the interior. The horn of the rhinoceros is quite distinct in character from the horns in any of the ruminants. It is a tegumentary, not an osseous appendage, and is usually described as if it were a mass of hairs which had coalesced. It consists, however, in reality of an aggregation of tubes, round which which the horny matter is arranged in concentric laminæ, as in the horny excrescences on the inner surface of the leg of the horse. The first and the third variety—viz., the antlers of the *cervidæ* and the hollow horns of the ox, etc.—alone require special notice.

The deciduous horns of the *cervidæ* at different ages, and their process of growth, are explained in the article DEER. To that description it need only be added that these horns are formed on two well-marked morphological types—one group possessing rounded antlers, such as occur in the roebuck and the red-deer, and the other having the antlers more or less flattened, as in the elk and fallow-deer. A remarkable sympathy exists between the generative organs and the horns; and the development of the latter may be arrested and their periodical shedding may be prevented by castration. As a general rule, it is only in the male *cervidæ* that horns are developed. In the reindeer, however, they are common both to the male and female.

In the hollow-horned ruminants, the bony protuberances or "cores" arising from the frontal bones, and supporting the horns, instead of branching like antlers, form more or less solid cylindrical shafts, the surface being protected by ordinary periosteum (q.v.), and by an extension of true skin, which becomes developed into a dense horny sheath.

The horns of ruminants are almost invariably two in number, but exceptions occur in the case of the extinct bramatherium and sivatherium, and amongst living species, in the four-horned goat, the many-horned sheep, etc. In the prong-horn antelope there seems to be an approach to the cervine type, there being a prong of some length about half-way up the horn, which may be regarded as analogous to the brow-antler.

HORN-WORK, in fortification, is a work having one front only, thrown out beyond the glacis of a fortress; with a view, 1. To strengthen a weak salient in the general outline; 2. To occupy a plateau in advance of the place, or to protect buildings, the including of which in the original enceinte would have extended it to an inconvenient degree; 3. To occupy a tongue of land protected on its sides; 4. To bar a defile; 5. To cover the head of a bridge; 6. To occupy rising ground, the possession of which would render the enemy more than necessarily dangerous. The front of a horn-work consists of two demi-bastions connected by a curtain, and usually defended in front, as in the fortress itself, by tenaille, ravelin, and covert-way. The flanks, protected by ditches, run straight upon the ravelin, bastion, or curtain of the main defenses, so that the ditch may be swept by the fire of the latter. The flanks should not be too long for easy musketry range.

In most of the earlier works of this nature, the ditch of the horn-work was united with the ditch of the main works by being cut through the glacis and covert-way, but in modern works the horn-work is constructed entirely beyond the glacis.

Occasionally, horn-works are very useful; but modern engineers generally prefer constructing detached and advanced works. A double horn-work becomes a *crown-work* (q.v.).

HORNY TISSUES were formerly regarded as extremely simple in their structure, and as being only different forms of a substance to which the term *keratin* (from *kĕras*, a horn) was applied. Recent investigations, however, show that the parts which consist of horny tissue—as, for example, the persistent horns of the ruminants, the epidermis, the nails, claws, and hoofs, whalebone, tortoise-shell, etc.—have a somewhat complicated, and, in some respects, a variable structure, although they are so far analogous to one another that they proceed from nucleated cells which are not morphologically developed like the cells of most other organs, but which, to a certain extent, dry up and are only agglutinated together by an intercellular substance. In a chemical point of view, they also closely resemble one another, for when compared with other tissues they all contain a large quantity of sulphur, in combination with a substance whose origin from or affinity with the proteine bodies (q.v.) is sufficiently obvious from their behavior towards certain re-agents (the caustic alkalies and the mineral and acetic acids, for example), and their percentage composition.

If a section of horn is examined in its natural state, it appears to consist of numberless bundles of fine threads lying side by side. After the addition of potash solution, these bundles are seen to unfold into little plates, which gradually expand into regular nucleated cells.

The cellular structure of hoofs, whalebone, tortoise-shell, etc., may be exhibited in a similar manner. It is to the histo-chemical investigations of Mulder and Donders that we are mainly indebted for our knowledge of the structure of these tissues, who seem to have established that every horny tissue contains at least three different kinds of substances—viz., 1. The substance of the cell-membranes, which is exceedingly difficult of solution in alkalies, and which forms the principal part of the tissue; 2. The cell-contents, which dissolve more readily in alkalies; and 3. A connecting or true intercellular substance.

These tissues have been submitted to ultimate analysis, after having been previously digested in water, alcohol, and ether. The analogy of their composition is shown in the following tabular view:

	Hair.	Horse's Hoof.	Cow's Horn.	Nails.	Epidermis.	Whalebone.	Tortoise-shell.
Carbon.....	50.65	51.41	51.03	51.09	50.28	51.86	51.89
Hydrogen....	6.36	6.96	6.80	6.82	6.76	6.87	6.56
Nitrogen.....	17.14	17.46	16.24	16.90	17.21	15.70	16.77
Oxygen.....	20.85	19.94	22.51	22.39	25.01	21.97	19.56
Sulphur.....	5.00	4.23	3.42	2.80	0.74	3.60	2.22

These tissues differ slightly in the quantity of inorganic matter which they contain, but the difference does not vary much beyond 1 per cent.

Hair yields from 0.54 to 1.85 per cent of ash, containing, amongst other ingredients, peroxide of iron and a little silica. In feathers, the quantity of silica is very considerable, and it is doubtless to this constituent that the shaft in a great measure owes its strength and hardness.

HORODEN'KA, a t. of the Austrian empire, in the province of east Galicia, on an affluent of the Dniester, 106 m. s.e. from Lemberg. Pop. '69, 10,000.

HOROL'OGY (Gr. *hora,* a defined portion of time) is that branch of applied science that has for its object the measurement of time. Although it is easy to look back on a period when time, according to the modern conception of it, as measured by hours, and minutes, and seconds, was unknown, yet we find progress early made in the measurement of larger periods of time, by observations of the heavenly bodies; and although, in the later progress of astronomy, it is found that the movements of the more conspicuous heavenly bodies do not afford accurate marks for the equable measurement of time, they were, for practical objects, sufficient, and afforded at least a better measure of time than any other phenomena which came under the observation of mankind. Thus, time was early divided into years, according to the motion of the sun among the constellations; into months, according to the motion of the moon relatively to the sun's place in the heavens; and into days, by the alternate light and darkness caused by the rising and setting of the sun. It was long, however, before any accurate measure was found for a division of the day itself. The earliest measure employed for this purpose that we can trace is the shadow of an upright object, which gave a rough measure of time by the variations in its length and position. This suggested the invention of sun-dial (see DIAL). Another means early adopted for the measurement of short periods of time was by the quantity of water discharged by dropping from one vessel into another. Instruments for the measurement of time on this principle were called clepsydræ (q.v.). The running of fine sand from one vessel into another was found to afford a still more certain measure, and hence the invention of the hour-glass (q.v.). King Alfred is said to have observed the lapse of time by noting the gradual shortening of a lighted candle. It is not very easy to trace to its source the history of the invention to which the modern clock owes its parentage; the earliest, however, of which we have a complete description, and perhaps the earliest which attained any distinct superiority to the rude machines already mentioned, was the clock of Henry Vic or De Wyck, a German, erected in the tower of the palace of Charles V., king of France, in 1379. A sketch of this clock, which is subjoined, will be useful not only from its historical interest, but also because, from its comparative simplicity, it will form a ground-work for further explanation of the mechanism of clocks and watches in their more complicated forms. It will be readily understood, from a glance at the annexed figure, that as the weight A tends to uncoil the cord and set in motion the cylinder B round its axis, the motion will be successively communicated to the various toothed wheels in the figure, and finally to the crown-wheel or escapement-wheel, I; the teeth of which so act on the two small levers or pallets, *i*, *h*, projecting from and forming part of the suspended upright spindle or vertical axis, KM, on which is fixed the regulator or balance, LL, that an alternating or vibratory, instead of a circular, motion of the balance itself is the result. The hands of the clock are attached to the wheel N, also set in motion by the cylinder B. Now, unless there were some check upon the motion, it is manifest that the heavy weight A would go rapidly to the ground, causing the wheels to rotate, the balance to vibrate, and the hands to go round with increasing velocity. In order to prevent this rapid unwinding of the clock-work, and adjust it to the more deliberate measurement of time,

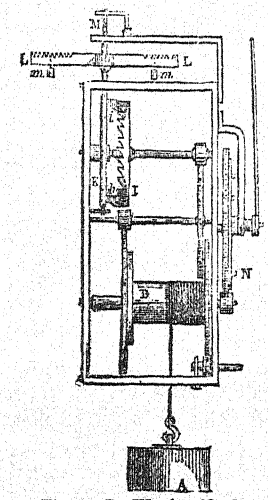


Fig. 1.—De Wyck s Clock.

the balance is, in De Wyck's clock, loaded with two weights, *m, m;* and the further these are removed from the axis or spindle, KM, the more heavily they will resist and counteract the escapement of the levers, and the rapidity of the rotation of the escapement-wheel, till the clock be brought to go neither too quick nor too slow.

The above construction is probably the basis of all the principal time-keeping machines in use in the 16th century. The great epoch in the history of horology is marked by the application to it of the pendulum (q.v.) as a regulating power. This was effected by Huygens (q.v.) about 1657. This philosopher, in adapting the pendulum to the machinery previously invented, had little more to do than simply to add a new wheel to the movement, so as to enable him to place the crown-wheel and spindle in a horizontal instead of a perpendicular position, that the lower arm of the balance—then of course perpendicular, instead of horizontal, as in De Wyck's clock—might be extended, as it were, downwards, and thus, in fact, be converted into a pendulum.

The principle of construction adopted by Huygens, from the peculiar action of the levers and spindle, required a light pendulum and great arcs of oscillation; and although, to secure isochronous vibration in these large arcs, the ingenious device of constraining the motion in a cycloidal curve was resorted to, yet the consequence was, as has been remarked, that "Huygens's clock governed the pendulum, whereas the pendulum ought to govern the clock." About ten years afterwards, the celebrated Dr. Hooke invented an escapement, which enabled a less maintaining power to carry a heavier pendulum. The pendulum, too, making smaller arcs of vibration, was less resisted by the air, and therefore performed its motion with greater regularity. This device is called the *crutch* or *anchor escapement*. It was brought by Hooke before the notice of the royal society in 1666; and was practically introduced into the art of clockmaking by Clement, a London clockmaker, in 1680. It is the form still most usually employed in ordinary clocks. It regulates the motion as follows: The pendulum is fixed at A, and hangs down behind the pallet-wheel (the last of the train of wheel-work), which revolves in the direction of BC, under the action of the weight; B and C are the pallets. When the pendulum swings to the left, AC rises, and a tooth escapes from C, while another falls on the outside of B, and, owing to the form of the pallet B, this latter recoils during the remainder of the swing. The same thing occurs on the pendulum's return; the arm AB rises, a tooth escapes from B, and another falls on the inside of C, and is pushed backwards by it during the remainder of the swing. The revolution of D is thus regularly retarded, one tooth being allowed to escape for every two oscillations—i.e., every two seconds—and as the wheel contains 30 teeth, it performs one revolution per minute (the seconds hand is fixed on the extremity of the axle of this wheel). During a portion of each contact between the pallets and teeth, the onward pressure of the wheel gives an additional impetus to the pendulum, so as to counteract the retarding effects of the resistance of the air and friction, which would otherwise bring it to a stand.

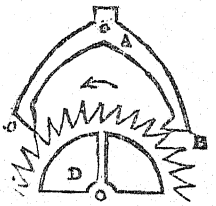

Fig. 2.

The only defect of this escapement is the recoil, and various modifications have been devised to obviate this. The first and most successful was made by George Graham, an English watchmaker in the beginning of the 18th c., and his improved form is called the *dead 'scapement* or *dead-beat escapement* (Fig. 3). Here the outer surface of B and inner of C are arcs of circles, whose center is A, and a little consideration will show that there can be no recoil. This escapement is adopted in time-keepers when great accuracy is required. Other inventions, as the *detached escapement*, the *pin-wheel escapement* in various forms, and the *gravity escapement* (described below), though very efficient, have not come into general use.

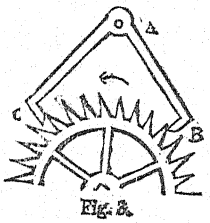

Fig. 3.

In the great clock in the new houses of parliament at Westminster, the pendulum is upwards of 13 ft. long, to beat 2 seconds, and its bob weighs 6 cwts. The motion is kept up by a *remontoir* or *gravity escapement*. On each side of the pendulum-rod a small metallic hammer is hung upon a peg. "The swinging of the pendulum first draws out a little bolt, that stopped the turning of a wheel; the wheel then goes round, under the influence of the weight, lifting one of the little hammers as it does so, until it is caught by another bolt. The hammer-head next falls by its own gravity, and strikes the pendulum-rod just as it is in the act of descending, communicating the force of its blow to quicken the movement; the same thing is afterwards repeated on the opposite side of the vibration, and then again on the same side; so going on alternately." The push thus given is evidently unvarying. The wheel has three stops and cogs on it, and goes once round in three beats of the pendulum, or in six seconds. With this contrivance "it is found that all the teeth of the several wheels may be rough, just as turned out from the casting, and the clock will nevertheless keep better time than it would have done with the most perfectly finished teeth under other arrangements."

The gradual perfection of the clock required also improvements in the pendulum (see PENDULUM).

The improvements in the escapement and the pendulum above referred to bring the mechanical perfection of the clock, as a time-keeping instrument, to the point which it has attained at the present day. But the art of horology would be incomplete unless there was some standard, independent of individual mechanical contrivances, to which all may be referred, and by which the errors of each—which must exist in the most perfect human contrivances—may be corrected. The movements of the heavenly bodies are still, as of old, the only standard for a general measurement of time, affording as they do marks of unvarying certainty, to be read by all alike; and clocks and other mechanical contrivances are individual and imperfect measures of the intervals, to be trusted only until there is a new opportunity of comparing them with the certain and public signals of the heavens. These signals can, however, only be accurately read by persons furnished with the proper apparatus, and instructed sufficiently in its use. This is done in observatories, and there are in most parts of this country now sufficient opportunities of setting clocks by a communication more or less direct with these establishments. When these are not to be had, the sun-dial may still be used with advantage, as a means of approximation to the correct time. The time which a clock ought to mark is *mean time*, the definition of which will be found in the article Day (q.v.). The *mean time* at any *place* depends on the longitude. Supposing a clock to be set to Greenwich mean time, a clock keeping mean time of any place will be 4 minutes faster for every degree of longitude east of Greenwich, and 4 minutes slower for every degree west. Since the introduction of railways, clocks are usually set, within Great Britain, to Greenwich mean time.

The methods by which time is determined in observatories belong to the details of practical astronomy. For the more ready transmission of correct time to the public, there is at Greenwich observatory, as well as some others, a ball which is dropped by means of electricity precisely at one o'clock. Within the last twenty years, however, there was invented a most ingenious device by which public clocks in a town can be kept at every instant in perfect agreement with the mean-time clock in the observatory. This is effected by an electric connection, and a modification of Bain's electric pendulum, invented by Mr. R. L. Jones of Chester, on the suggestion of Mr. Hartnup, the astronomer of the Liverpool observatory. For a description, see ELECTRIC CLOCK. The first public application of it was to the town-hall clock in Liverpool, when for the first time was seen the curious spectacle of a great clock with works nearly 100 years old keeping time with astronomical accuracy In the same way, a clock in the castle of Edinburgh, by whose mechanism a gun is fired precisely at one o clock every day, is controlled by the mean-time clock in the observatory on the Calton hill.

It is not known when the alarm or when the striking-mechanism of the clock was first applied. The alarm was adopted for the use of the priesthood, to arouse them to their morning devotions. The first striking-clock probably announced the hour by a single blow, as they still do, to avoid noise in churches. During the 17th c., there existed a great taste for striking-clocks, and hence a great variety of them. Several of Tompion's clocks not only struck the quarters on eight bells, but also the hour after each quarter; at twelve o'clock, 44 blows were struck; and between twelve and one, no less than 113! Many struck the hour twice, like that of St. Clement Danes, in the Strand, London.

The striking part of a clock is rather a peculiar and intricate piece of mechanism. In ordinary clocks, the impelling power is a weight similar to that which moves the time-measuring mechanism itself; but the pressure of this weight on the striking-machinery is only permitted to come into play at stated periods in course of the workings of the time-keeping apparatus—viz., at the completion of every hour; when the minute-wheel, which revolves once in an hour, and carries the minute-hand of the clock along with it, brings it into action by the temporary release of a catch or detent, permitting the weight wound up on the cylinder of the striking-apparatus to run down for a little, in doing which, the hammer is forced into action, so as to strike the bell. Whether the strokes shall be one or many, is determined principally by two pieces of mechanism, one called a *snail*, from its form or outline, with twelve steps, and the other a *rack*, with twelve teeth; but the intricate action of the whole it would be in vain here to attempt to explain. Suffice it to say, that the time during which the striking-weight is *allowed* to descend, varies according to the turning of the twelve steps of the snail on its axis, and the position of the twelve teeth of the rack, at different hours of the day; being sometimes only long enough to permit one blow to be given by the hammer on the bell, and at another time long enough for twelve such blows.

The consideration of portable time-keepers (watches and chronometers) is reserved for the head WATCH.

HOR'OSCOPE. See ASTROLOGY.

HORROCKS, JEREMIAH, an astronomer of remarkable genius, generally known as t' first observer of the transit of Venus, an account of which phenomenon he has given in a Latin treatise entitled *Venus in Sole visa*. He was born at Toxteth, near Liverpool, date uncertain, supposed to be 1618; he entered Emanuel college, Cambridge, May 18, 1632; was appointed in 1639 to the curacy of Hoole, Lancashire, in which village he made his famous observation (Nov. 24, 1639, o. s.), while a mere youth. Horrocks died suddenly

on Jan. 3, 1641, the day before an intended journey, having promised to visit his chief friend, William Crabtree. Dr. Wallis, his contemporary, informs us that Horrocks at the time of his death "had not completed his 23d year." Hearne, in his memoranda, tells us how Horrocks was called away, during his observation of the transit, "to his devotions and duty at church;" to which interruption the astronomer thus alludes in his treatise: "*Ad majora avocatus, quæ ob hæc, parerga negligi non decuit.*" Newton, in the *Principia*, bears honorable testimony to the value of Horrocks's astronomical work, especially commending his lunar theory as the most ingenious yet brought forward; adding, "and if I mistake not, the most accurate of all." Horrocks is frequently mentioned by the scientific men of the 17th c.; the observation of the transit by no means being regarded as the most important of his astronomical achievements. Hevelius printed the *Venus in Sole visa*, which first appeared in Germany (1662). In 1672 Horrocks's fragmentary works were published under the auspices of the royal society, being edited by Dr. Wallis, with the title *Jeremiæ Horroccii Opera Posthuma*, etc. The name of Jeremiah Horrocks, long forgotten, except by astronomers, is now, "after the lapse of more than two centuries," engraven on marble in Westminster Abbey.

HORRY, a co. in e. South Carolina, bordering on North Carolina and the ocean; crossed by the Wilmington, Columbia, and Augusta railroad, and intersected by the Waccamaw river; 1000 sq.m.; pop. '70, 10,721—3,235 colored. It has a level surface with many marshes. The productions are rice, sweet potatoes, and pork. Co. seat, Conwayborough.

HORRY, PETER, a native of South Carolina; soldier in the revolutionary army; serving as a brig.gen. with Francis Marion, whose biography he wrote in conjunction with Weems.

HORSA. See ANGLO-SAXONS, *ante*.

HORS DE COMBAT, a French term, literally meaning "beyond the battle," is used to signify a combatant, or body of combatants, so completely beaten either by physical force or strategy, as to be incapable of further action in the struggle actually under consideration.

HORSE, *Equus*, a genus of pachydermatous quadrupeds of the family *equidæ* (q.v.), or *solidungula*, generally regarded as including all the species of the family, although sometimes limited (see Ass), so as to contain only one species, the most important to man of all animals that are used as beasts of burden and of draught. The principal zoological characters are already given in the articles EQUIDÆ and ASS, and a more particular description of the horse seems to be unnecessary. The native country of the horse is uncertain. Some contend for Asia, and some for Africa; some suppose that the horse was first domesticated in Egypt, and quote Scripture in support of their opinion, but to no better purpose than to show that at a very early period it was in use as a domesticated and valued animal among the ancient Egyptians; whilst others adduce arguments not more conclusive to show that it was originally domesticated in the n.e. of Asia; some think it not improbable that Europe also, and even Britain, had indigenous horses. Whether certain wild races of central Asia and the n. of Africa are really indigenous to the regions in which they are found, or the offspring of animals which have escaped from domestication, like those of America, and whether the origin of the domestic horse is to be referred to one original form, or to several forms somewhat different, and belonging to different countries, are questions also uncertain; and the last of them is very similar to that which is so much agitated respecting the dog (q.v.), although it must be admitted that the diversities are not so great as in that case.

The lips and teeth of the horse adapt it for cropping the short herbage of dry plains or hills, so that it finds abundance where an ox would be very insufficiently supplied. The feet are also adapted to dry rather than to soft or swampy ground. On soft ground, not only is the foot apt to sink, not being very broad, but the horny hoof is softened, and a diseased state of the feet is the result, as in the case of many of the great dray-horses of London, reared in the alluvial districts of the east of England. The horse, however, requires a liberal supply of water; and during the dry season, in the hot plains of South America, great troops of wild horses often rush furiously to the rivers, and as they approach the drinking-place, trample one another under foot, vast numbers of skeletons remaining to bleach in the sun.

Wild horses are found on the plains of central Asia. Some also inhabit mountainous or hilly districts both there and in the n. of Africa. They abound still more in the grassy plains of North and South America, although they were first introduced into America by Europeans; and certain tribes of Indians, both in North and South America, have become at least as equestrian in their habits as any of the Tartars of the east. Wild horses are also found in the Falkland islands, into which they were introduced by Europeans, and a peculiar breed has been found in a wild state in the island of Celebes.

The races or varieties of the horse have an evident relation to the climate of the countries in which they occur. Those of cold and stormy regions are comparatively small and rough-haired; those of more favored climates, large and sleek. There are also differences, more evidently to be ascribed to domestication, according to which certain breeds are particularly adapted to certain kinds of work, some excelling in fleet-

ness, some in endurance, some in mere strength for burden or draught. The slender form of the race-horse or hunter contrasts almost as strongly with the ponderous solidity of the dray-horse, as the great size of the latter does with the diminutiveness of the Shetland pony.

Wild horses congregate in troops, sometimes small, but sometimes of many hundreds. The males have fierce contests for the supremacy, and males that have contended unsuccessfully are often driven off to a solitary life. On the appearance of danger, the chief stallion of a small troop seems to direct the movements of all, and even the largest troops seem instinctively to move in a kind of concert, so that when they are assailed, the stronger animals oppose the enemy, and protect the younger and weaker. Wolves, even when in packs, attack with success only weakened stragglers, and even the jaguar is repelled. In fighting, horses either raise themselves on their hind-feet, and bring down the fore-feet with great force on the enemy, or wheeling about, kick violently with the hind-feet.

The *tarpan* of Tartary is one of those races of wild horses which are sometimes regarded as original, and not descended from domesticated animals. It is of a reddish color, with a black stripe along the back, and black mane and tail. The eye is small and vicious. Tarpans are sometimes caught by the Tartars, but are with great difficulty reduced to subjection. In some of the steppes of central Asia are wild horses of a white or dappled-gray color.—The wild horse of South America is there called the *mustang*. It exhibits considerable diversity of color, but bay-brown is the most prevalent. It is strong and active, and is often taken with the lasso, and employed in the service of man. A curious method is practiced by some Indian tribes of promptly subduing its wild nature, and rendering it tractable, by blowing strongly with the mouth into its nostrils. By other tribes, it is subdued more rudely. It is thrown on the ground, and ere it can recover, a man gets upon its back, whom, when it rises, it cannot shake off, and who retains his seat until it is quite submissive.—The *koomreh* of n. Africa is regarded by col. Hamilton Smith as a distinct species (*E. hippagrus*). It has no forelock, but woolly hair on the forehead, is of a reddish-bay color, without stripe on the back or any white about the limbs, has limbs of a somewhat ass-like shape, and the tail covered with short hair for several inches at the root. It is an inhabitant of mountainous regions.

Of domestic varieties and breeds of the horse, the number is very great, almost every country or considerable district having one or more of its own, and particular breeds being valued on account of their fitness for particular purposes. The breeds are also continually varied by crossing, and great improvements have thus been effected. The superior fleetness of the English race-horse and endurance of the hunter are ascribed to the crossing of the old English breed of light-limbed horse with the Arabian; and the English dray-horse, remarkable for its great size and strength, in like manner owes much of its excellence to the crossing of the largest old English breed of draught-horse with the Flemish. A breed produced by crossing one of the lighter kinds of English draught-horse with the race-horse is in the highest esteem for carriage-horses. North America has a breed of light-limbed horses, remarkable for fast trotting. The *Suffolk Punch* has been the origin of many of the most useful kinds of draught-horses employed in Britain for ordinary farm-work. The *Clydesdale horse* is also one of the best breeds of this class, and is an improvement on an older breed. Numerous breeds of smaller size, *ponies*, have long existed in different parts of Britain, and in almost all other countries. The *Shetland pony*, which, compared with the dray-horse, is like a pocket edition of a book beside a great folio, is most prized when most diminutive, and sometimes does not much exceed a large dog in stature. A strong man has been seen to lift one with his arm, and again to ride on its back, whilst at the same time he walked with his feet on each side on the ground. The Shetland pony is, however, a very hardy animal, and remarkably strong.

The Arabian horse has long been the object of untiring care and attention, and to this very much of the excellence of the race is certainly to be ascribed. The regard of the Arab for his horse has long been famous. Very similar in some respects to the Arabian is the Barbary horse, which was highly prized in western Europe before the Arabian was known there, and from the name of which is derived the English word *barb*.

The horse has been used from the most remote ages both for riding and for drawing carriages, but rather for pomp or pleasure, the chase, and war, than for agricultural or other labors, for which oxen and other animals were for a long time more generally employed. The horse is an animal of no little intelligence, docility, and affectionateness; qualities of which the display would certainly be more general and perfect, if it were not for the cruel treatment so commonly practiced in "breaking" and otherwise. The horse has a very strong memory of places, and finds again very readily a road which it has once traveled before. Its caution in advancing on swampy ground has often excited admiration. It seems often to enter with a kind of enthusiasm into the work in which it is engaged: the war-horse evidently delights in the martial music and military movements to which he has been accustomed; the racer and the hunter seem to know the object of their exertions, and to be as keenly bent upon it as their riders; and the draught-horse often exhibits much acquired expertness in situations of considerable dif-

ficulty. Instances are also on record of the remarkable display of intelligence in such things as the opening of doors, corn-chests, etc.; and two instances are known of horses which have learned to turn the tap of a water-barrel in order to obtain water, one of which also ended by shutting it again. A horse has been seen to procure a supply of apples in an orchard by throwing himself forcibly against the trees and shaking them.

The flesh of the horse is used as food in some countries. Its use has recently found advocates in France and some other parts of Europe. It is sold in London as food for dogs and cats. Mares' milk is much used by some of the tribes whose chief wealth consists in their horses: and the Kalmucks subject it to fermentation, and distill from it a kind of spirit. The hide of horses is made into leather, which is used for covering large office and board-room tables, etc. The long hair of the mane and tail is used for making haircloth, stuffing mattresses, etc.

Hybrids between the horse and the ass are noticed in the articles HINNY and MULE. Hybrids have also been produced between the horse and the zebra, and between the horse and the quagga, exhibiting, in some degree, the stripes so characteristic of these species; but they have been turned to no use.

Fossil Horse.—The remains of the horse have been long noticed associated with the mammoth, rhinoceros, and other extinct quadrupeds, in the drift formations and ossiferous caverns in the new world, as well as in the old. Their occurrence in America is the more remarkable, from that continent being entirely without the horse when it was discovered by Columbus. Cuvier was unable, in the fragments that he examined, to see any difference from the similar portions of the existing species. Meyer and Kaup have pointed out distinctive characters, and Owen has shown that the remains observed in this country belong probably to two different species. The largest (*equus fossilis*) was about the height of a middle-sized domestic horse, and differed from this animal in possessing a proportionally larger head and jaws, resembling in this respect the wild horses of Asia described by Pallas, and in having the molar teeth, while equal in length, yet decidedly smaller. The second species (*equus plicidens*) was about the size of a large ass, and differed from the other species, as well as from the living horse, in the more complex plications of the enamel of its molar teeth.

Horses, of whatever breed or description, should be of good size, shape, and style; for superior animals are fed and kept at the same cost as inferior sorts, are always able to perform their work easily and satisfactorily, and are at any time salable at remunerative prices. To produce such animals, requires careful selection of sound, active, symmetrical, well-descended parents. The mare carries her colt eleven months, but occasionally exceeds her time by one or two weeks. Farmers prefer their mares to foal in May, from which time the age is generally calculated, but on the turf, ages date from Jan., and hence the earlier the racing foals are dropped the better. Parturition is usually performed easily and without any assistance, the foal soon getting on his legs, and sucking. Good grass, with a feed of oats daily, will insure an abundant supply of milk. Weaning may take place in five or six months; and the foal, when taken from its mother, must be supplied with a few oats and bran, some good hay, and comfortable shelter at night. At a year old, colts are generally castrated; and are gently broken in and lightly worked when about three years old; but under good treatment they continue to grow, and ought not to be put to severe work until they are five.

Oats and hay are the staple articles of food for hard-working horses. The oats should be sound, sweet, and heavy; and for hacks and hunters, are seldom sufficiently dry until they are a year old. Along with good hay, 10 lbs. is a fair allowance. To insure thorough mastication and digestion, oats should be given either slightly bruised or along with some chaff. For coaching or farm-work, a few beans or peas should be given; half a bushel, along with a bushel of oats and hay, is a usual weekly allowance for well-kept farm-horses. Clover and rye-grass hay (q.v.), such as is common throughout Scotland, is more palatable and nutritive than the meadow-hay in general use in England. Riding-horses eating a fair allowance of oats, will consume daily 14 lbs. of hay; but the heavier class of horses require more. Farmers use oat, pea, and bean straw for fodder during the winter months, and in most well-managed establishments a considerable portion of the fodder is now given cut, which enables the hard-worked horse to fill himself more rapidly, and thus gives him more leisure for rest and repose. Cart-horses usually have an evening allowance of sliced Swedes or carrots; a daily pound of linseed-cake is now frequently added, to keep the coat glossy; whilst a weekly bran-mash is advisable, and should contain during winter an ounce of pounded niter. Horses should be liberally supplied with water at least three times daily, nor is it ever necessary to restrict the supplies, except for a few hours before severe fast work, and when the animal is much overheated and fatigued. In some well-constructed boxes and stables it is so arranged that water is constantly before the animal in a shallow vessel capable of holding about a quart, and which, as it is removed, is slowly replenished, and thus cannot be drunk either with undue rapidity or in injurious quantity. During summer, horses generally have such green food as grass, clover, or vetches; but if their work is severe or long continued, oats and hay ought still to form the principal articles of diet. In summer, farm-horses are often turned out to graze after their day's work is over; but it is generally more economical to bring their green food to the stable, or, better still, to commodious yards. It is seldom advisable to follow the old-fashioned

plan of turning hacks or hunters out to grass, as they are apt to get kicked or otherwise injured, and lose besides their condition. If not required during the summer months, they are better and safer in a large yard or a commodious box, where they can have proper feeding and daily exercise. They will thus, at little extra expense, be kept in good condition and fit for work, their legs free from blemishes, and their constitutions uninjured by violent diversities of feeding and management. The small stomach and natural habits of the horse indicate the necessity of his being fed at frequent moderate intervals of five or six hours. In most localities, farm-horses turn out at seven, returning to the stable at 11.30 or 12, being fed and rested for an hour and a half or two hours, and then returning to work for four or five hours. In the midland and southern counties of England, the straggling position of the fields, and their inconvenient distance from the stables, induce many farmers to keep their horses in the yoke from seven until two or three, when they finish for the day. This practice is, however, by no means commendable, unless the work is very light, and the horses have a feed, a few mouthfuls of water, and 10 or 15 minutes' rest about mid-day.

To insure health, horses must be kept in commodious, well-lighted, airy, properly-ventilated stables, which ought to be erected only in dry situations, should be thoroughly underdrained, and well paved, if possible without a loft overhead, whitewashed annually, and always kept scrupulously clean and free from smell. This may be effected by the prompt removal of soiled or wet litter, and by strewing the floors daily with a little gypsum, or M'Dougal's disinfectant powder. Where there is room, loose boxes are preferable to stalls, especially for the lighter sort of horses, that spend much of their time indoors. With proper feeding, exercise, and grooming, with plenty of fresh air, and good stable management, horses are scarcely ever out of health, and require neither balls, cordials, nor any such messes. Without professional advice, no groom or carter should, under any pretense, be permitted to indulge his predilection for physicking or doctoring healthy horses.

HORSE, a miner's term, applied to any intruded material which is the apparent cause of a sudden interruption in the continuity of a mineral that is being quarried. With vein-miners a detached mass of rock or spar which fills the vein receives this name, while colliers apply the term to the shale which occupies a natural but sudden thinning out of the coal-bed, as well as to such interruptions as seem to have been the channels of small streams, and which were subsequently filled up by the clay that formed the roof of the coal.

HORSE-CHESTNUT, *Æsculus*, a genus of trees of the natural order *sapindaceæ*, having large opposite digitate leaves, flowers with five spreading unequal petals, and a leathery 3-valved capsule covered with soft spines. The seeds, which are not more than three in each fruit, are large, and somewhat resemble chestnuts; but the habit of the trees, their leaves, and their flowers, are very unlike those of chestnuts, with which they have no botanical affinity.—The COMMON HORSE-CHESTNUT (*Æ. hippocastanum*) is a much esteemed ornamental tree, very frequently planted in Britain, and in all parts of Europe of which the climate is suitable, on account of its rich foliage and its erect racemes of beautiful reddish-white flowers, which are produced at the extremities of the branches and contrast admirably with the dark green of the leaves. At St. Petersburg the horse-chestnut is a greenhouse tree. It is supposed to be a native of Persia or some part of the east; but, strangely enough, its native country is still somewhat uncertain. It was introduced into western Europe, from Constantinople, in the end of the 16th century. It attains a great size, sometimes rising to the height of 100 ft., and extending its branches very widely, whilst they often droop almost to the ground. The leaves have long stalks, and seven obovate-wedged-shaped leaflets. The wood is soft, not very strong, nor very durable in the open air; but is used for many ordinary purposes, and by carvers, turners, etc. The bark is bitter and astringent, containing a bitter principle called *æsculine;* it has been used in tanning and dyeing; that taken from branches not very old has been extensively used on the continent of Europe as a substitute for Peruvian bark. The rind of the seeds contains a coloring matter which has been used in dyeing; the husks also have been used in dyeing. The seeds are unpleasantly bitter, and contain so much of the saponaceous substance prevalent in this natural order that when reduced to powder they may be used for washing. They contain, however, a large quantity of starch, which, when extracted and freed from bitterness by means of an alkaline solution, is pleasant and nutritious. It is prepared on a large scale and at a cheap rate in France. Horse-chestnuts have long been employed in various countries as food for oxen, sheep, swine, and horses, all of which are fond of them and grow fat upon them. In Britain, however, they are still very generally allowed to rot beneath the trees. It is said that when the horse-chestnut was first introduced into Britain, it did not perfectly ripen its seed, which it now does even in the northern parts of the island.—The other species of *æsculus* are natives of North America. The foliage is very similar to that of the common horse-chestnut. Both the leaves and fruit, however, of the BUCKEYE or AMERICAN HORSE-CHESTNUT (*Æ. ohiotensis*) are very poisonous.—North America possesses also a number of species of a nearly allied genus, *pavia*, with very similar foliage, smaller flowers, and smooth fruit. The seeds of *P. macrostachya* or *P. edulis*, the EDIBLE BUCKEYE, are eaten, either boiled or roasted. This species is a shrub

with long and beautiful racemes of fragrant white flowers, which have long projecting stamens. It is a native of the southern states, and seldom ripens its fruit in England. *P. indica*, is a lofty tree, growing at elevations of 8,000 to 10,000 ft. in the Himalaya, and producing seeds very similar to those of the horse-chestnut, which, although bitter, are eaten in times of scarcity.

HORSE-EATING. See HIPPOPHAGY.

HORSE-FLY. See FOREST-FLY.

HORSE, FOSSIL, in general terms, the fossil remains of animals which have been classified as belonging to the *equidæ*, or horse family. These remains are all confined to the tertiary formation, with the exception of a few, which are recent. They have been found in the eocene, pliocene, and miocene of Europe and America, but the greatest number and the most perfect gradation are found in North America, which, it is claimed, gives evidence of descent from the eohippus of the eocene to the present one-toed horse. Thirty-five o forty species, which compose several genera, are said to have been discovered, the classification having been made upon variations in the form and size of the skeleton. Different forms were found from time to time, and although it was believed that they were links in a chain of organisms which connected the horse zoologically with the eohippus, they were broken links, and no perfect chain could be formed out of them. Now, however, it is claimed that the chain is complete, all the missing links having been found, principally by Prof. O. C. Marsh, of Yale college, in the tertiary beds of our western territories. The ungulates, the sixth order of the class mammalia, are divided into two sections—those in which the toes are odd in number, and those in which they are even. The horse family, *equidæ*, belongs to the odd-toed section, which also contains the rhinoceros and the tapir. It is the seventh and last family, and is now regarded as containing seven or more genera. These genera are all extinct, and known only in the fossil state, except the present species, *equus caballus*. The argument for the gradual evolution of the horse through these extinct genera is well though briefly stated by Prof. Joseph Le Conte (*Elements of Geology*, N. Y. 1878), in a chapter on the age of mammals, in which he traces indications of evolution in other animals, one of these being the gradual enlargement of the brain cavity, and says: "In conclusion it will be interesting and instructive to run out one of these branches and show in more detail the genesis of one of the extreme forms. For this purpose we select the horse, because it has been somewhat accurately traced by Huxley and Marsh. About thirty-five or forty species of this family, ranging from the earliest eocene to the quaternary, are known in the United States. The steps of evolution may therefore be clearly traced. In the lowest part of the eocene basin (coryphodon beds) of Green river is found the earliest known animal which is clearly referable to the horse family; viz., the recently described eohippus of Marsh. This animal had three toes on the hind-foot and four perfect, serviceable toes on the fore-foot; but, in addition, on the fore-foot an imperfect fifth metacarpal (splint), and possibly a corresponding rudimentary fifth toe (the thumb), like a dew-claw. Also, the two bones of the leg and forearm were yet entirely distinct. This animal was no larger than a fox. Next, in the middle eocene (Bridger beds), came the orohippus of Marsh, an animal of similar size, and having similar structure, except that the rudimentary thumb or dew-claw is dropped, leaving only four toes on the fore-foot. Next came, in the lower miocene, the mesohippus, in which the fourth toe has become a rudimentary and useless splint. Next came, still in the miocene, the miohippus of the United States and nearly allied anchithere of Europe, more horse-like than the preceding. The rudimentary fourth splint is now almost gone, and the middle hoof has become larger; nevertheless the two side-hoofs are still serviceable. The two bones of the leg have also become united, though still quite distinct. This animal was about the size of a sheep. Next came, in the upper miocene and lower pliocene, the protohippus of the United States and allied hipparion of Europe, an animal still more horse-like than the preceding, both in structure and size. Every remnant of the fourth splint is now gone; the middle hoof has become still larger, and the two side-hoofs smaller and shorter, and no longer serviceable except in marshy ground. It was about the size of the ass. Next came, in the pliocene, the pliohippus, almost a complete horse. The hoofs are reduced to one, but the splints of the two side-toes remain to attest the line of descent. It differs from the true horse in the skull, shape of the hoof, the less length of the molars, and some less important details. Last comes, in the quaternary, the modern horse—equus. The hoof becomes rounder, the splint-bones shorter, the molars longer, the second bone of the leg more rudimentary, and the evolutionary change is complete."

The following tabular statement will give a good idea of the relations of the genera of the horse family at a glance.

EQUIDÆ, OR HORSE FAMILY.

1. *Eohippus:* lower eocene of New Mexico. Animals of this genus small, about the size of a fox; fore-feet having four toes with a rudimentary thumb; hind-feet three toes, all the digits terminating in hoofs; bones of leg and forearm entirely distinct.

2. *Orohippus:* found in beds somewhat above the latter; about the size of a fox; fore-feet four-toed; third digit largest; hind-feet three-toed; all trace of thumb of eohippus gone; and the last premolar resembles the molars instead of the premolar in front

of it, as in eohippus. Canines large and widely separated from the molars. Dental formula same as in eohippus, viz.:

$$i\,\frac{3-3}{3-3};\ c\,\frac{1-1}{1-1};\ pm\,\frac{4-4}{4-4};\ m\,\frac{3-3}{3-3}=44.$$

3. *Mesohippus:* lower miocene, N. A. About the size of a sheep, but having longer legs; hind-feet three-toed; fore-feet three-toed, but having rudimentary metacarpal (splint-bone), representing the little finger; last two premolars resemble the molars.

4. *Miohippus:* upper miocene, N. A. Animal rather larger than a sheep; all the feet three-toed, toes of nearly equal size; the little finger of the left hand has the same rudimentary metacarpal as in the preceding; no antorbital fossa.—*Anchitherium:* genus of European miocene, allied to miohippus, but having many characteristics resembling the paleotherium, so that it may be regarded as transitional between equidæ and paleothoridæ; species about the size of a sheep; all the feet are three-toed, and all the toes touch the ground, but middle toe larger in proportion than in preceding, and there is no representative of the little finger; differs from miohippus in having a large antorbital fossa.—*Hipparion:* later southern European miocene and pliocene periods; skeleton like that of horse in general conformation; feet three-toed, but middle toe much the largest and the only one of any use or that touches the ground.

5. *Protohippus:* lower pliocene of N. A. This is considered the North American equivalent of the European hipparion, although larger than the latter, some species having been about the size of the ass. The formation of the feet was the same as in hipparion.

6. *Pliohippus:* pliocene. Feet resemble in structure the modern horse or genus equus; that is, there is only a single functional toe, the second and fourth toes being rudimentary (splint-bones). This genus, however, differs from equus in having a large antorbital fossa, and also in having an additional upper premolar, the dental formula being as follows:

$$i\,\frac{3-3}{3-3};\ c\,\frac{1-1}{1-1};\ pm\,\frac{4-4}{3-3};\ m\,\frac{3-3}{3-3}=42.$$

7. *Equus.* This genus, which includes the modern horse, is thought to have made its appearance at the close of the miocene or commencement of the pliocene period. In the old world the first appearance of true horses is thought to have been in the *equus sivalensis* of the Siwalik hills in the upper miocene or lower pliocene. In the pliocene of Europe, North America, and South America the genus is well represented, and the *equus fossilis* of the post-pliocene and recent periods is specifically undistinguishable from the existing *equus caballus.* (Nicholson.)

The dental formula of the horse is as follows:

$$i\,\frac{3-3}{3-3};\ c\,\frac{1-1}{1-1}\text{ or }\frac{0-0}{0-0};\ pm\,\frac{3-3}{3-3};\ m\,\frac{3-3}{3-3}=40.$$

The above statement is an outline of the argument in favor of the theory that the horse (as well as all the members of the animal and also of the vegetable kingdom) is the result of gradual evolution. The objectors to this theory do not deny that there are close relations in structure, or that there *might* have been great similarity in the habits of the different genera, as they have been classified; but they deny that there is any evidence which indicates that one genus was the progenitor of another, or that the various species, of which there are more than thirty, were ever produced from one origin. It is held that there is nothing to warrant the conclusion that the eohippus should lose his thumb and pass into the genus orohippus, or that the latter should all at once pass from the size of a fox to that of a sheep and lose one of the four toes of his fore-foot. On the contrary, it is held that there are structural characteristics in the genera which warrant the conclusion that one genus was not the progenitor of another, or that one was not derived from the other by any law of natural selection.

In miohippus, for instance, there is no antorbital fossa, while in anchitherium, which is said to follow in development, there is. It might, however, be said that the latter is a European type; but the American pliohippus of the pliocene beds—the genus which immediately precedes that of the horse, or equus, as the next fossil form is held to be—has also a large antorbital fossa, while the latter has not. Again, the genus equus in the above arrangement, and which is the last of seven genera in a scale of progression, has been classified by some, including Dr. J. E. Gray, the eminent British naturalist, as distinct from that of the ass and zebra, which they place in the genus asinus. Linnæus and Cuvier, however, placed all three in the genus equus. But it is held that, whether classed as two genera or one, they present the same distinctive characteristics which they had more than 4,000 years ago, and that there is no evidence for a belief that they are not distinct creations, notwithstanding that the skeleton characteristics of these animals are precisely similar (Cuvier's reasons for placing them in one genus), there being no anatomical differences. How then, it is asked, if the horse and zebra and ass differ so widely, even when having the same kind of skeleton, can it be held

that skeletons of animals differing as much as miohippus and pliohippus—the latter having a large antorbital fossa while the former had none, and having one toe while the former had three—belong to the same family, and stand so closely related that one has sprung from another? There are many fishes whose skeletons have greater similarity than obtains in the fossil horse family, but whose other characteristics are entirely distinct, and it is held that there is no evidence of their ever having been otherwise. On the other hand, it is not denied that there is the highest evidence of a plan in creation furnished by the discovery of these fossil horses, as they are called, as there are other evidences of a plan exhibited in all the works of nature. But it is said that while they furnish evidence of a plan, they furnish evidence also that that plan was carried out by distinct creations from the peculiar anatomical differences, as noticed above, and which cannot be accounted for by any law of differentiation in the species or genus which should cause it to deviate from miohippus to pliohippus, and from the latter again to equus, miohippus having no antorbital fossa—pliohippus having large antorbital fossa, and equus, again, having none. In view of the facts and arguments on both sides, it is probably safe to say that the evolution in the instance referred to is, at least, not yet proved. It remains an ingenious and interesting hypothesis.

HORSE-GUARDS, the name applied to a large public office in Whitehall, appropriated to the departments under the general-commanding-in-chief. The word horse-guards is used conventionally to signify the military authorities at the head of army affairs, in contradistinction to the civil chief, the secretary of state for war.

HORSE-GUARDS, Royal, or Oxford Blues, is the third heavy cavalry regiment of the household brigade. The regiment was raised in 1661 from the remnants of the disbanded army of the late commonwealth. It has ever proved a loyal corps, although it readily transferred its allegiance from James II. to William III. It took part in Marlborough's campaigns; served under the duke of Wellington in the Peninsula and at Waterloo, and has always been considered one of the finest heavy cavalry corps in the world. The guards of state for the sovereign are taken either from its ranks or from those of the life-guards. The present uniform consists of a steel helmet, with plume, a steel cuirass over a blue coatee, leather breeches, and knee-boots; the horses are black. The establishment of the regiment consists of 1302 of all ranks, with 825 horses, exclusive of officers' chargers.

HORSE MACKEREL. See Tunny, *ante.*

HORSEMANSHIP. Throughout history the art of managing the horse and riding on his back has ranked high among useful and graceful accomplishments. According to Cæsar and Livy, the Numidians and Mauritanians rode their horses without either bit or saddle, and guided them solely by using a small switch, which was applied to either side of the neck, according as they wished to turn. The Persians trained their horses to kneel to receive their riders, and were the first to introduce saddles. Saddles of a similar shape to those now in use were not known till the 14th c., and side-saddles were introduced about 1388. Stirrups were used in the 5th c., but were not common even in the 12th.

The two essentials for riding are a firm seat and a light hand, as without a combination of the two no one can become a good horseman. In every description of riding, the light delicate "hand," just feeling the mouth of the horse, and playing the bit in accordance with his movement, will insure success; and it is to this delicacy of wrist that we must attribute the ease and skill with which ladies often ride the most high-spirited animals, which, in rougher hands, would be unmanageable.

The first lesson in horsemanship is to learn to mount safely and easily; and the ordinary and on the whole least objectionable way is as follows: Stand at the shoulder of the horse, looking towards his tail, and taking the reins in the right hand, divide them by the middle-finger of the left till you feel the horse's mouth; then take hold with the left hand of a lock of the mane, lift the left foot into the stirrup, and using the mane as a slight hold, spring into the air, taking hold of the back of the saddle to assist in getting the right leg easily over the horse, steadying the fall of the body by the right hand on the pommel, and then arranging the stirrups. In dismounting, exactly the reverse of this process is followed, or both feet may be disengaged from the stirrups at once, and the rider may vault from the saddle to the ground with greater rapidity, and less risk of falling if the horse chance to move on.

There are four different styles of riding practiced among modern civilized nations—viz., the military, road, hunting, and racing styles. The military style differs in many particulars from the others, as, owing to the long stirrups used, the soldier is obliged to sit well down in his saddle, with his body erect, the seat being preserved more by balance than by a tight hold by the leg or thigh.

In the seat for road-riding, the stirrups are arranged at such a length that when the feet are hanging loose, they shall just touch the anklebone, and the rider usually inserts the feet only as far as the "ball" of the foot. In riding, have the horse well in hand, to assist in supporting him, in case of stumbling; the seat firm, to be secure in case of shying; and a knowledge of handling the bridle, to insure a quick and ready response. In hunting, a much firmer seat is necessary; the stirrup-leathers are about two holes shorter, the feet pressed "home" in the stirrups, which otherwise would be apt to be

lost in jumping; the leg from thigh to the knee well forward, and nearly at right angles to the upper part of the body as inclined forward; the legs perpendicular, the heel well down, and the toe pointing nearly straightforward. This "seat" the hunter has in common with all equestrian nations, as the Arabs, Tartars, Persians, Egyptians, Cossacks, Magyars, and Circassians, the last mentioned nation carrying it to such an extreme that the leg assumes the form of the letter V, with the knee for the apex. In riding at a fence, "collect" the horse into the pace at which he goes with most ease to himself; keep him straight at the fence till he rises; "ease" his mouth by leaning forward; take especial care not to confine it when he is making his effort, or you will pull him into the fence as he descends; lean well back in the saddle, and gently take hold of his mouth to support him on landing. Do not gallop with a loose rein (excepting downhill, when the horse requires his head free), for the horse will go with a straggling pace, which is very undesirable. For racing, the essentials are a good and powerful seat, good "hands," a great knowledge of pace, and quickness to take advantage of any chances of success. The jockey's seat is peculiar, as his object is to give as much ease as possible to his horse. He rides very much forward, frequently standing in the stirrups, and regulating his pull at his horse according to his orders.

As the strongest part of a horse, and also the center of action, is situated at a point just behind his shoulder-blades, the nearer we can ride to this the better, and riding rather forward in the saddle is a relief to the horse, while leaning back, as it bears upon his loins—his weakest part—is a cause of fatigue. The grip in riding should be obtained by the knee, the thighs and the calves slightly. The thigh is the most essential part of a good and strong seat. Few riders whose thighs are short and round, have a good seat; while, on the other hand, jockeys and tall thin men, whose thighs are long, and more or less hollowed on the under side, are generally very firm.

No one can pretend to horsemanship without a knowledge of the proper action for emergencies. If a horse runs away, do not exhaust yourself by vain pulling, but guide him out of danger, and let him run till he is tired. A Bucephalus noseband is a great security against bolting. If a horse rears, loosen the reins, and lean forward; in hunting, the "art of falling" consists in getting clear of your horse. In case of a horse kicking, keep his head up as much as possible, and sit firm in the saddle.

HOR'SENS, a small but very old t. and seaport on the e. coast of Denmark, and one of the prettiest and most thriving in the country, is situated at the head of the fiord of the same name, 25 m. s.w. of Aarhuus. It contains two churches, has four bridges, and carries on manufactures of tobacco and a considerable general trade. Pop. '70, 10,501.

HORSE-POWER, a term used in expressing the force of a motive power. It is based upon the assumption that horses in general perform a certain constant amount of work in a specified time; an assumption which is evidently erroneous. The fundamental unit of work is the foot-pound (q.v.); but in measuring the work of a horse by this unit, the estimates of the most celebrated engineers differ widely from each other: Boulton and Watt, basing their calculations upon the work of London dray-horses (working eight hours a day), estimated it at 33,000 foot-pounds per minute. D'Aubuisson, taking the work done by horses in whims at Freiberg, estimated the work at 16,440 foot-pounds, working eight hours a day; under similar circumstances, Desaguliers's estimate was 44,000; Smeaton's, 22,000; and Tredgold's, 27,500 foot-pounds; 17,400 is thought to be near the truth. It matters little, however, what number is assumed, provided the same be always used; and accordingly the original estimate of Watt is still counted a horse-power. In calculating the power of a steam-engine in terms of this unit, the general rule is to "multiply together the pressure in pounds on a square inch of the piston, the area of the piston in inches, the length of the stroke in feet, and the number of strokes per minute: the result divided by 33,000 will give the horse-power;" but it is necessary to deduct about $\frac{1}{16}$th of the whole, as an allowance for friction.

HORSE-RACING dates from the times of the early Greeks and Romans, among whom it was a favorite sport. In England, Charles I., Cromwell, and Charles II. were more or less patrons of the turf; and the last-named monarch was a regular frequenter of Newmarket, which, partly from this reason, became the metropolis of racing. William III. and queen Anne were also patrons of horse-racing. Flying Childers, bred in 1715 by the duke of Devonshire, was long considered to have been the fleetest horse ever known; he carried nine stone at Newmarket, and ran 3½ m. in 6 minutes 40 seconds; he was never beaten, and produced 497 winners, besides realizing £200,000 in stakes. The celebrated horse Eclipse, the fleetest from the time of Childers, was bred in 1764 by the duke of Cumberland. Commencing at five years old, this horse won eleven plates, was never beaten, and became the sire of innumerable winners. The modern race-horse is considerably taller and of earlier maturity than the original type, partly from judicious crossing, and also from early high-feeding and training; yet there has been a loss of stoutness of constitution, although, for speed, no pure bred Arab has a chance with a modern thorough-bred. The horses are entered as yearlings (a race-horse's age dates from Jan. 1 in the year he is foaled); but of 240 entered in this way, rarely more than 25 come to the post two years afterwards, the majority being found practi-

cally useless for racing purposes, and the forfeits from these horses thus "scratched" form by far the greater portion of the splendid prizes of the turf. (It has been calculated that there are 1500 thorough-bred brood-mares in England; that these produce annually about 1100 foals.) The value of a thorough-bred yearling depends entirely upon "the fashion" of his blood: as much as 3,000 guineas have been given, and 1000 and 1500 are by no means extravagant rates for promising colts. The training of the young racer commences in his second year, when he is placed under a trainer, in an establishment such as those at Newmarket, Middleham, Richmond, Malton, Ilsley, Epsom, etc., where the downs offer a wide expanse of open country for exercise. The trainer's charge is two guineas a week; and for this each horse is personally attended to and ridden by a lad specially attached to him. A thorough preparation for a great race is a long and troublesome operation, consisting of several stages, during which the colt is gradually brought from a naturally loose condition to the greatest perfection possible: first by steady and continuous walking exercise, then proceeding by gradual stages to gentle galloping and sweating, and finishing by testing the capacity of the colt against a competitor at a distance equal to the forthcoming race. It has been found that, practically, the speed of almost all horses can be equalized by addition or subtraction of weight to be carried when running; and so nicely is this adjusted that the handicaps (q.v.), arranged on this principle, provide some of the best races in the year. The Chester cup, Doncaster cup, Ascot cup, Goodwood cup, Liverpool cup, Cezarewitch and Cambridgeshire stakes, are all run on these terms. For the great prizes of the turf, however, the 1000 and 2,000 guineas, the Derby (about £6,000), Oaks (about £4,000), and St. Leger (about £5,000), for three-year-olds, the horses run upon an equality of age and weight.

Enormously large as are the stakes run for—upwards of £200,000 annually—this is as nothing to the money which annually changes hands in betting. We may divide betting-men into two classes—those who back a single horse, from judgment or private information; and those who, without any knowledge, but from mere calculation, estimate the odds, and take the "field" against "any favorite." The latter class are the professional betting-men ("the ring"), who devote themselves to the pursuit; the former is composed of the owners of horses and their friends, who trust to their knowledge and tact. Colossal fortunes have been made by the "ring" in this way, and there are men perpetually attending the country races, and ready to lay against any horse and "back" the "field." As no debts incurred by betting are recoverable by law, they become debts of honor; and any "defaulter" is only amenable to the regulations of the turf, which have been devised to insure, as far as possible, honest dealings. The Jockey Club is the great tribunal of sport in England, and its regulations are adhered to all over the country: it is composed of 64 noblemen and gentlemen, who take an interest in the turf. Newmarket heath, the great center of racing, is in its possession, and by virtue of the position and authority of its members, it is enabled to exercise a great check upon dishonesty and fraud. The seven annual race-meetings at Newmarket are as follows: The Craven, first Spring, second Spring, July, first October, second October, and the "Houghton." The principal races are for the 1000 guineas, 2,000 guineas, Cezarewitch, and Cambridgeshire. The Epsom meeting is the most popular, from its nearness to London, and from the interest attaching to the races for the Derby and Oaks. After Epsom, the Doncaster St. Leger, for three-year-olds, claims the position of greatest interest; it is run for by the competitors in the previous Derby and Oaks, and is generally considered to be a test of the correctness of their results. Ascot is reckoned the most fashionable meeting in the year; it is held on Ascot heath, in Berks, and here the best horses in England compete, at a more mature age than at other races. In the race for the Ascot cup in 1854, West Australian ran the 2¼ m. in 4 minutes 27 seconds, the fastest race on record. Goodwood meeting, which is held in the duke of Richmond's park, in Sussex, is also popular. There are upwards of 150 race-meetings held annually in the United Kingdom; upwards of 1600 horses run at these, and 160 jockeys are in constant employment. A good jockey is considered so valuable that he is always retained by one or more masters, for a considerable sum, and these gentlemen have a call upon his services in a certain rotation. The regular pay of a jockey is £5 for a winning and £3 for a losing "mount;" but there are so many gratuities, that this gives no indication of the income of a jockey, which is often very large: £1000 has frequently been given by a grateful owner. Racing has become popular in France, Russia, Austria, Prussia, Sardinia, and in the British colonies of India, Australia, the Cape, and Canada.

In addition to the flat-racing in England, there are a great number of steeple-chases, where horses contend over natural and artificial fences, ditches, etc. The sport is dangerous, on account of the immense speed arising from competition, so that horses get too distressed to jump, and broken backs and ribs are the consequence. In America trotting-matches are very popular, and their horses excel all others in that description of racing.

HORSE-RACING (*ante*). The racing of one horse against another is probably coeval with their subjection to the use of man, but racing as understood at the present time is of comparatively recent date. Something like jockeyship, however, was prac-

ticed in very early times, the Greeks having introduced it at their celebrated games. In the 33d Olympiad they had their race of full-aged horses, and in the 71st Olympiad a race for mares called the Calpe was instituted. In the 131st Olympiad a race for under-aged horses was established, but we are left in doubt as to the weight the horses carried, or the distance they ran. Alexander the great is said to have been ambitious of obtaining the Olympic crown, and although Macedonians were excluded, the Elean jockey club allowed him to start; but he did not win. Themistocles objected to Hiero, king of Syracuse, as a tyrant, and proposed that the magnificent pavilion containing his race-horses should be pulled down, but the objection was overruled, and he became a winner. Horse-races were known in England in very early times. An old black-letter pamphlet, containing the poetical legend of sir Bevis of Hampton, mentions Whitsuntide as a season of the year at which races took place, and goes on—

> Whiche horse that best may ren
> Three myles the course was then,
> Who that might ryde him shoulde
> Have forty pounds of redy gold.

That horse-racing was commonly practiced at Easter is proved by the fact that, in the 17th c., it was prohibited "as being contrary to the holiness of the season." Fitz-Stephen, in the days of Henry II., mentions the delight taken by the citizens of London in the diversion. James I. made the sport a royal amusement, and set the example of paying large prices for foreign horses of supposed superior breed. Croydon in the south and Garterly in the north were celebrated courses. In the reign of Charles I. races continued to be held, the most noteworthy being the meetings in Hyde park and at Newmarket. The precedent was established of giving as prizes silver cups, instead of coin. Charles II. encouraged the sports of the turf, and under his reign they became national in England. The Godolphin Arabian, the progenitor of the best blood, appeared in the reign of George II. In the commencement of that of George III., Eclipse was foaled, and at that time racing, as now understood, was really established. The first racing calendar is said to have been published by John Cheney in 1727. The most eminent races in England are those at Newmarket, established in 1667, and at Epsom, inaugurated about 1711 by Mr. Parkhurst, and which were made annual after 1730. The earl of Derby began the "Oaks" in 1779, it being so called after his seat in the neighborhood. The Derby, which was first won by Diomed in 1780, generally takes place on the Wednesday in the week preceding Whitsunday. The winners from 1876–79 were Kisber, Silvio, Sefton, and Sir Bevys. In 1880 it was won by Bend Or in 2 minutes 46 seconds, the course being a mile and a half in length. The Ascot meeting is the next great racing festival after the Derby, and was begun in 1727 by the duke of Cumberland, uncle to George III. The St. Leger stakes were founded at Doncaster in 1776. The races at Goodwood were first held in 1802. The Jockey Club, which now chiefly regulates races and the betting connected with them, was founded in 1750. Flying Childers, bred in 1715 by the duke of Devonshire, was the fleetest horse that ever ran at Newmarket. He ran 4 m. in 6 minutes and 48 seconds. Eclipse, the fleetest horse in England since the time of Childers, was never beaten, and died in 1789, aged 25 years. The grand prize of Paris, for which the best English and continental three-year-olds compete, was established by Napoleon III. Since 1856 there has been a race-course at Longchamps, within an easy drive of the capital.

It will be some time before horse-racing in America attracts the attention or assumes the importance that it has done in England. Nevertheless, racing is fast becoming a national sport. Jerome park, in Westchester co., N. Y., is the American Epsom downs. The arrangements are complete, and may challenge comparison with any of the great race-courses of Europe. It was opened in 1866, and under Mr. Jerome's leadership the club in connection with it have made racing agreeable and respectable, and the presence of ladies from New York assures for it the character of a popular and reputable recreation. The Brighton Beach fair-grounds at Coney island, an enterprise which was started a few years ago at a cost of $300,000, furnishes one of the best courses in the country, and is certain to obtain popularity. There are also excellent races at Monmouth park near Long Branch, Sheepshead bay and Saratoga Springs, N. Y., Point Breeze park of Philadelphia, Lexington, Ky., Baltimore, Louisville, New Orleans, Rochester, Buffalo, Chicago, Boston, Springfield, Hartford, and at many other places.

The trotting horse of America is a really distinct variety of the equine race. Hiram Woodruff developed the breed and made it famous. The best American trotters are descended from an imported English horse named Messenger, of which Mr. George Wilkes said, in an often quoted passage, that "when Messenger came charging down the gang-plank of the ship which brought him over, the value of not less than one hundred millions of dollars struck our soil." Hambletonian was the grandson of Messenger, and it is asserted that if he had been broken and trained as a trotter, his own name would have gone down to posterity in company with that of his son Dexter, Flora Temple, Lady Suffolk, Goldsmith Maid, and other animals capable of the greatest achievements on record. In 1874 Goldsmith Maid trotted a mile in harness in the surprising time of 2 minutes 14 seconds, beating the record of Dexter by 3¼ seconds. This great performance was eclipsed in 1878 by Rarus, who trotted a full mile at Buffalo in 2 minutes 13¼ seconds, and by St. Julien in 1879, who trotted a mile at Oakland, Cal.,

in 2 minutes 12¾ seconds, improving this record in 1880 at Hartford, Conn., to 2 minutes 11½ seconds. But the fastest time in the records of the turf is that of Maud S., who startled the racing community by trotting a mile at Chicago, Sept. 18, 1880, in 2 minutes 10⅝ seconds. One mile has also been trotted in less than 2 minutes 17½ seconds, the best time of Dexter, by the following horses: Smuggler, 2:15½; Great Eastern, under saddle, 2:15⅝; Hopeful, to wagon, 2:16½; Lula, 2:16½; Occident, 2:16¾; American Girl, 2:16¾; Gloster, 2:17. The best time in harness, for 2 m., is 4 minutes 48½ seconds, made by Steve Maxwell at Rochester, N. Y., Aug. 10, 1880, beating the record of Flora Temple by two seconds and that of Dexter by two seconds and a half.

It is but a short time since thorough-bred racing has become a formidable rival in America to the national sport of trotting. The public interest, however, has been awakened by the brilliant triumphs of Mr. Lorillard's Parole, beating in 1879 English horses upon their native heath. Ten Broeck has made the excellent record of 1 m. in 1 minute 39¾ seconds; 2 m. in 3:27½; 3 m. in 5:26½, and finished 5 m. in 7:15¾. The celebrated steeple-chaser Trouble is the best cross-country horse that has appeared in this country for many years. Among many other fine race-horses are General Philips, Vera Cruz, Duke of Magenta, Tom Ochiltree, Cloverbrook, Mollie McCarthy, Bob Wooley, and Tom Bowling. During 1880 the best records of previous years have been beaten by Bramboletta and By-the-Way running ⅝ m. in 1:2½; by Barrett and Knight Templar running ¾ m. in 1:14; by Blackburn running 1½ m. in 2:34, and Monitor finishing 1¼ m. in 3:2¾. See DERBY DAY, *ante*.

HORSE-RADISH, *Armoracia*, a genus of plants of the natural order *cruciferæ*, differing from scurvy-grass (*cochlearia*) chiefly in having the valves of the seed-pouches destitute of prominent nerves. The species are perennial herbaceous plants, having erect stems and white flowers, and roots remarkable for their pungency, which is owing to a volatile oil, of very powerful odor, believed to be identical with the volatile oil of mustard. The COMMON HORSE-RADISH (*A. rusticana*) has long cylindrical white roots, stems about 2 ft. high, large, much-veined, oblong, crenate root-leaves on long stalks, and elongate-lanceolate stem-leaves. It grows in damp meadows in the middle and s. of Europe, is naturalized in some places in Britain, and is cultivated for the sake of its roots, which are scraped or grated down and mixed in salads, or used as a condiment with roast-beef. Horse-radish root is used also in medicine as a stimulant, and is often useful in promoting digestion; it is also regarded as an antiscorbutic; and it is sometimes applied externally as a rubefacient instead of mustard. In cultivation, the horse-radish is generally planted very deep. It is very difficult to eradicate from ground in which it has become established, as almost any portion of the root will grow.—Another species, *A. macrocarpa*, a native of Hungary and Transylvania, has much larger flowers, and a rather less pungent root.

HORSE-RADISH TREE, *Moringa pterygosperma*, a tree of the natural order *moringaceæ*, a native of India and Arabia. It has bipinnate or tripinnate leaves, with roundish oblong leaflets, terminal panicles of white flowers, and a pod-like, 3-valved fruit, with roundish 3-winged seeds. The leaves, which are mildly pungent, are used in curries, and with vinegar: the roots, which are very pungent, are used for purposes like those for which the root of the horse-radish is used, from which they are not easily to be distinguished. The seeds yield the useful fixed oil called *oil of ben* (q. v.), and the bark a gum like tragacanth. *M. aptera*, another species of the same genus, also a native of the East Indies, is cultivated in Egypt, Syria, and Italy, for the sake of the oil of ben obtained from its seeds. For the sake both of the pungent roots and of the oil, these trees are now cultivated also in the West Indies.

HORSE-SHOEING. The ordinary system of horse-shoeing is rude and irrational, and is the main cause of most lamenesses and of the majority of falls in riding and driving. Chief amongst its faults are the attempts to fit the foot to the shoe, instead of the shoe to the foot, and the wholesale cutting and rasping, and consequent injury of the several parts of the foot. After the cautious removal of the old shoe, the crust on which it rested generally requires to be pared down with a drawing-knife, and its edge afterwards rounded with the rasp. Any ragged portions of the frog may also be taken off, and this includes the whole of the allowable paring or dressing of the horse's foot. The horny sole intended as a covering and protection of the sensitive parts beneath; the tough elastic frog, an insensible pad which obviates concussion, and preserves the foot wide and free from contraction; the bars, an involution of the crust, which help it to support weight, and give it lateral support, are all too valuable to be ruthlessly cut away, and in all ordinary cases must be scrupulously preserved from both knife and rasp. For sound healthy feet treated as advised, a plain shoe is preferable for saddle or harness horses; the web need not exceed three-fourths of an inch, must fit the crust closely and accurately all the way round to the heels, where its inner edge will rest upon the strong and uncut bars. Nowhere must there be any overlapping, which only renders the shoe more apt to cut the opposite limb, and be torn off in heavy ground. To lessen the chances of tripping, and make the shoe wear equally, it should for the fore-feet be turned up slightly, and its ground surface hollowed out a little at the toe, so as to present the appearance of an ordinary shoe which had been worn for a fortnight or three weeks; and which, as every one knows, is therefore rendered more safe and

comfortable. By turning up at the toe, these advantages are secured at once. For saddle or light harness work three nails on the out- and two on the inside will firmly secure any well-made, well-fitting shoe. The nail-holes should be countersunk, be nearly in the center of the web, and pass straight through it, thus giving the nails a firmer hold of the stout unrasped crust. The points of the nails when driven home should be broken over and laid down with the hammer, but not touched with the rasp. The rasping of the crust which smiths fondly regard as their finishing and polishing stroke, is very injurious, removes the unctuous protecting portion of the crust, and renders it weak, brittle, and liable to crack. Shoes should be replaced every three weeks, or a month at furthest. In shoeing the hind-feet the outside web is generally turned slightly down behind, whilst to give an equal bearing the inside heel is thickened. For heavy draught, both hind and fore shoes should have moderate tips and heels, which enable the horse to exert his full powers without so much risk of slipping. Instead of the five nails used for the lighter horses, seven or eight are requisite.

Horses with weak, tender, or bruised soles may for a time require leather or waterproof pads, but as the sole grows, these should be discontinued, and are never required in healthy feet, where the sole, which is the best and most natural protection, is allowed to grow undisturbed by the knife. Horses with corns should have their shoes made with a wide inside web, which rests upon the bars, or have for a time a bar-shoe. The last nail on the inside should also be dispensed with, and the seat of the corn or bruise carefully pared out, but without injuring either the frog or bars. If, from constant cutting, the bars are unfit to aid the crust in carrying the shoe, it will be often advisable to shoe for a time with tips or half-shoes, keeping the horse as much as possible on soft ground, and waiting the healthy growth of the foot. In troublesome cases of thrush, such tips are also most serviceable, allowing the frog the natural healthy pressure for which it is intended, and with astringents and cleanliness greatly expediting a cure. Groggy horses should have the toe shortened, and turned up, as already advised; the frog and sole must be untouched, and the shoes made light and nicely fitted. Overreach, or cutting of the heel of the fore-foot with the shoe of the hind, is remedied by filing round the posterior edge of the offending toe, and keeping that shoe as far back as possible on the foot. For speedy cut, which is common in horses with in-turned knees, the shoe should be carefully fitted and no projecting portions left; the clinches must also be well hammered down.—Further information may be found in lieut.-col. Fitzwygram's *Notes on Shoeing Horses;* Mr. Miles's pamphlet on *Horse-shoeing,* originally published in the journal of the royal agricultural society; prof. Dick's manuals, and other veterinary treatises.

HORSETAIL. See EQUISETUM, *ante.*

HORSE-TAMING. The taming of horses to increase their value and usefulness has been attempted in all countries where the equine race has flourished. But the credit of first reducing the art to a system belongs to John S. Rarey, whose treatise, originally published in America, and republished in 1858 in England and France, went through a large number of editions, and is still considered an authority on the subject. One of his greatest triumphs was in England over the racing colt Cruiser, which was so vicious that he had killed several grooms, but was completely tamed by Rarey, and afterwards brought to America. The system is founded on a profound study of the disposition of the animal. In contrast with the usual mode of training by harsh words, a sharp whip, and cruel worrying, he demonstrates how easily, quietly, and safely horses may be tamed by kindness.

The education of the horse should be that of the child. Pleasure should be as much as possible associated with the early lessons, while firmness and coercion, when necessary, must establish the habit of obedience.

The first step towards the breaking of a horse is placing a halter upon his head, and can be easily accomplished by a little dexterity and caution. The colt should then be taking to the longeing ground and taught to lead. The large, smooth snaffle, with keys depending from its central ring, is considered by many trainers to be the best bit for mouthing purposes. After the colt has been shod, and has been driven about the roads in reins for a few days to accustom him to shoes, he may be saddled, but at first without stirrup-straps or stirrups, as they act as alarmants. Before breaking a horse to harness he should previously have been well mouthed, and broken to the saddle. The hames and traces should be omitted on the first day, and the harness should be so constructed that the tugs open from above, allowing the shafts to drop into them. The two-wheeled break should be strong and high on the wheels, that the splinter-bar may be high, and so prevent the animal kicking over it. Bearing-reins are useless and cruel, as the horse is made to suffer great pain, and cannot pull to the full extent of his power when his head is kept in a constrained position.

HORSHAM, a parliamentary borough and market-t. of England, in the county of Sussex, is situated on a tributary of the Arun, 28 m. n.e. of Chichester, and 35 m. s.s.w. of London. The court-house, a Gothic edifice; St. Mary's church, in the early English style; and the grammar-school, with an endowment of £412 a year, are the principal institutions of the town. The trade and manufactures are inconsiderable. Horsham returns a member to parliament. Pop. of parl. borough in 1861, 6,747; in 1871, 7,831.

HORSLEY, CHARLES EDWARD, b. England, 1824; studied music in Germany, passing some months with Mendelssohn, and studying under Moritz Hauptman and Spohr. Owing to the failure of his health he went to Australia in 1861, and in 1872 came to New York, where he became organist in St. John's (Prot. Epis.) church. He has published three oratorios, three cantatas, and a number of shorter compositions.

HORSLEY, JOHN CALLCOTT, b. England, 1816; a painter who has produced a great number of works, and is especially successful in genre painting. In 1843 he won a prize for his representation of "St. Augustine Preaching," and was engaged upon the cartoons for the new houses of parliament. Some of his productions are "L'Allegro and Il Penseroso," "Under the Mistletoe," "Caught Napping," "Scenes from Don Quixote," and "Healing Mercies of Christ."

HORSLEY, SAMUEL, an English prelate, was the son of a clergyman of the Episcopal church, and was b. at St. Martin's-in-the-Fields, London, in 1733. He was educated at Westminster school and Trinity hall, Cambridge, where, though he studied hard, and laid in immense stores of knowledge, he took no degree in arts. In 1758 he became curate to his father, then rector of Newington, and shortly after succeeded to the rectory, a living which he held for 34 years, though he also enjoyed in the interval many other preferments. In 1767 Horsley was elected a fellow of the royal society, of which he long continued an active member. In fact, the writings that first brought him into notice were scientific, and not theological. We may mention his *Remarks on the Observations made in the late Voyage towards the North Pole, for determining the Acceleration of the Pendulum, in lat.* 79° 51′ (1774). Two years afterwards, he issued proposals for a complete edition of the works of sir Isaac Newton, which, however, did not make its appearance till 1785. But the grand event in his career was his controversy with Dr. Priestley, which, considering the momentous nature of the subjects discussed, and the splendid talents of the combatants, may be safely pronounced to be the greatest theological contest of the 18th century. The impression at the time was, that so far as hard, merciless *hitting* goes, Horsley had decidedly the best of it. Rude in language, but panoplied in learning, contemptuous, defiant, dictatorial, his attitude reminds one of Goliath rather than of St. Paul, and we cannot but feel that he is, at least, as much inspired by the ambition of the pugilist as by the ardor of the Christian. The work that excited the controversy was Dr. Priestley's *History of the Corruptions of Christianity*, among which corruptions was included the orthodox doctrine of Christ's uncreated divinity. Horsley reviewed the work with great severity in his charge delivered to the clergy of the archdeaconry of St. Albans, May 22, 1783. Priestley replied the same year in a publication entitled *Letters to Dr. Horsley in Answer to his Animadversions*, etc. In 1784 Horsley retorted in 17 *Letters from the Archdeacon of St. Albans in reply to Dr. Priestley*, etc. These were, in return, met by a new series from Priestley, who, waxing warm with the fight, describes his antagonist as "the incorrigible dignitary." After a silence of 18 months, Horsley again replied in his *Remarks on Dr. Priestley's Second Letters*, etc., and in 1789 collected and published the whole that he had written on the subject. His services were rewarded with the bishopric of St. Davids in 1788, whence he was translated to the bishopric of St. Asaph's in 1802. He died Oct. 4, 1806. Horsley's character as a writer has been already indicated; it remains to be added that as a bishop he was liberal and humane both to the clergy and the poor of his diocese, although vigilant and even strict in the discharge of his episcopal duties. Horsley's works, besides those already mentioned, consist of sermons and treatises on biblical criticism, on mathematics, and on classical subjects. A collected edition of his theological works was published by Longman (6 vols., 1845).

HORSLEY, WILLIAM, 1774–1859; b. England; became a musician of celebrity. He studied under Dr. J. W. Callicott, whose daughter he married. He was the author of many popular glees.

HORTA, a seaport in the Azores, the capital of the island of Fayal; pop. 7,636. It possesses a safe and good harbor.

HORTENSE EUGÉNIE DE BEAUHARNAIS. See BONAPARTE, *ante*.

HORTENSIUS, QUINTUS, 114 B.C.—50 A.D.; b. Rome; famous as a lawyer and an orator, attracting general attention before he was 20 years old. It is said that he was unscrupulous in his efforts to win any cause that he pleaded, and was not above the use of bribery. Although he was the political and legal foe of Cicero, personally the two orators were friends; but at one time Cicero accused Hortensius of duplicity. Hortensius was questor, ædile, pretor, and consul. His private life was luxurious and to some extent immoral.

HORTICUL'TURAL SOCIETIES, associations for the encouragement of gardening, are now numerous in almost all civilized countries, but seem to derive their origin only from the beginning of the present century, when the *London Horticultural Society* was formed, chiefly through the exertions of Mr. Knight, Mr. Wedgewood, and sir Joseph Banks. The society obtained a charter in 1808. The *Experimental Garden* of the society, the first of its kind, was established in 1817, and was removed to its present situation at Chiswick in 1822. The progress of the society was very rapid, and its usefulness has been very great. Societies of the same kind soon began to spring up in Germany and

other parts of the continent of Europe, and horticultural societies now exist in almost all the towns and in many of the villages and rural districts of Britain. The *Prussian Gardening Society* perhaps ranks next in importance to the horticultural society of London; and the *Pomological Society of Altendorf* has been very useful in regard to the cultivation of fruits. The horticultural societies, now so common throughout Britain, have done much to promote not only horticulture, but habits of neatness and a taste for flowers among the humbler classes, of which the humanizing effects have been very manifest and important. It is perhaps to be regretted that their attention has been so exclusively devoted to the cultivation of particular kinds of vegetables already in general use, and of those flowers known as florists' flowers.

HORTICULTURE. See GARDENING.

HORUS, an Egyptian deity, whose name, *Har*, means "the day," or "the sun's path," and is generally written in hieroglyphics by the sparrow-hawk, which was sacred to him. The old derivation from the Hebrew *aur*, light, is now recognized as incorrect. Under the name of Horus were included several deities, as Haroeris (q.v.), the elder Horus, and Harpocrates (q.v.), or the younger Horus; *Har-sam-ta*, Horus, the uniter of the upper and lower world, who was the second son of Athor, resided in Annu, or Heliopolis, and emanated from the eye of the sun (Rosellini, *M. d. c., t.* 47); and *Har-net-ta*, another form of the same god, represented as a boy wearing a triple crown, who existed from the commencement of things, a self-created being, and emanated from the Nu, or firmament; besides several others. But the principal Horus was Horus the son of Isis (*Har-si-hesi*), represented as a naked child standing, wearing a skullcap, or the crown of upper and lower Egypt. Horus is first mentioned by Herodotus (ii. 144, n. 156) as the son of Isis and Osiris, and brother of Bubastis, the Egyptain Diana. Various accounts are given of his birth; he having been, according to one version, engendered of his father Osiris before the birth of Osiris and Isis; or, according to another account, begotten of Osiris after that god's destruction by Typhon. His birth was said to be premature, and he was consequently weak in his lower limbs. In order to avoid the persecution of Typhon, he was brought up by Leto on the floating island of Chemmis, or Buto, in secret. Having grown up, he became *Har-net-atf* (Horus the avenger of his father), and, along with Isis, avenged his father's death (see OSIRIS), according to the best received tradition, vanquishing Typhon and his associates in a great battle at a village near the city of Antæus, on the 26th of the month Thoth, on which occasion Osiris came from the nether world to his assistance in the shape of a wolf (Diodor. i. 21). According to the Egyptian ritual, he cut off their heads for the fowls of heaven, and their thighs for the wild beasts and fishes. Typhon is said to have been delivered bound in fetters to Isis, who released him, upon which Horus tore the diadem off his mother's head, but Thoth replaced it by the head of a cow. Horus was often confounded with the elder Horus by the Greeks, but the monuments represent him as the type of royalty, the antagonist of Set or Typhon, the avenger of his father Osiris, for whom he obtained the corn of Elysium and the waters of Elephantine, conquered the north and south and shared Egypt with Set or Typhon, having held the government of the northern portion as Typhon of the south. After the death of Typhon he became sole monarch, and, as last king of the dynasty of gods, reigned, according to different versions, 100 or 25 years. Numerous esoteric explanations have been given of this god, as that he represents the Nile, as Typhon the desert, the fruitful air or dew which revives the earth, the moon, the sun in relation to the changes of the year, or the god who presided over the course of the sun. He also represented three planets, Jupiter (*Hâraphâta*), Saturn (*Harka*), and Mars (*Harteshr*). The sparrow-hawk was sacred to him; so were lions, which were placed at the side of his throne. There was a festival to celebrate his eyes on the 30th Epiphi, when the sun and moon, which they represented, were on the same right line with the earth. A movable feast, that of his coronation, is supposed to have been selected for the coronations of the kings of Egypt, who are described as sitting upon his throne. When adult, he is generally represented hawk-headed; as a child, he is seen carried in his mother's arms, wearing the pschent or atf, and seated on a lotus-flower with his finger on his lips. He had an especial local worship at Edfou or Hut, the ancient Apollinopolis Magna, where he was identified with Ra, or the sun. There were also books of Horus and Isis, probably referring to his legend (Lucian, *De Somn. sive Gall.* s. 183). The magnet was called his bone; he was of fair complexion.—Birch, *Gall. of Antiq.* p. 35; Wilkinson, *Mann. and Cust.* vol. iv. p. 395; Tablonski, *Panth.* ii. 4, p. 222; Champollion, *Panth. Eg.;* Hincks, *Dubl. Uni. Mag.* xxviii. p. 187; Boeckh, *Manetho,* p. 61.

HORUS, a king of Egypt, named Haremhebi, who reigned at the close of the 18th dynasty. His reign has been placed at 1661, 1455, or 1446 B.C., but it probably fell about 1400 B.C. Although the lists of Manetho give him a reign of 36 or 38 years, no higher monumental date than his 7th year has been hitherto found. He restored the worship of Amen Ra, which had been overthrown by the disk or sun worshipers, and conquered the Barubaru, a tribe of the negroes of Kush or Ethiopia. The most southern point where his monuments have been found is Gebel-Addeh, the ancient Amen-Heri, between the Wady Halfa and Ibsamboul. He also embellished Luxor and other quarters of Thebes. Fine statues of this monarch exist at Turin, and others in

the British museum.—Brugsch, *Geographie des Alten Ægyptens;* Champollion-Figeac, *L'Egypte*, p. 319.

HORVAT, ISTVÁN (Stephen), the Hungarian Varro, was b. at Stuhlweissenburg, in 1784. From early youth to his death in 1846, Horvat consecrated all his rare abilities to historical research, with the double object of settling the question as to the origin of the Magyars, and of consolidating Hungarian nationality through the scientific development of the Hungarian language. Among Horvat's published works, the chief merit belongs to his *Magyarország Tösgyökeres Régi Newzetségeiröl* (Primitive Families of the Hungarians, Pesth, 1820), an 8vo vol. of moderate size, but the materials for it have been gathered from innumerable rare manuscripts, and other documents, partly foreign, partly domestic. It is a monumental work in genealogy, connecting some of the living Hungarian families with the chieftains who came with Arpád at the end of the 8th century. In 1814 appeared at Pesth, *Defense of the Kings Lewis the Great and Mathias Corvinus;* in 1821, two vols. of *Answers to the Questions on Philology, put by the National Museum at Pesth;* in 1825, *Sketches from the Oldest History of the Hungarian Nation;* in 1828 and 1829, *Researches on Biblical Expressions*, etc. Horvat was for many years editor of, and later, chief contributor to the *Tudom ányr Gyüj temény*, or Scientific Magazine.

HORVÁTH, MIHÁLY, b. Hungary, 1809; took holy orders in 1830, and in 1844 became professor of the Hungarian language and literature at Vienna. At the time of the revolution in Hungary he was minister of public worship and education; after its suppression he was expatriated until 1866, when he obtained permission to return to his native country. He is the author of a *History of Hungary.*

HOSACK, DAVID, LL.D., 1769–1835; b. New York; graduated at Princeton in 1789; studied in Europe, and in 1795 was chosen professor of botany in Columbia college, and in 1797 of materia medica. In 1807 he became professor of materia medica and of midwifery in the college of physicians and surgeons, then newly founded, and subsequently of the theory and practice of physic, and of obstetrics and the diseases of women and children. He was the founder of the first botanic garden in the U. S. He was concerned with Drs. Mott, Macneven, and Francis in organizing the medical department of Rutgers college, at New Brunswick, N. J. In New York city he filled various medical offices in asylums, hospitals, and for the city in general. He was also one of the originators and for 12 years president of the New York historical society, and was a fellow of the royal society of Great Britain.

HOSANNA, a Hebrew word, meaning *Save, we pray.* At the feast of tabernacles the Jews carried branches of the palm and myrtle tree, repeating verses 25 and 26 of Psalm cxviii., which begins with hosanna. The expression became a term of acclamation, and was applied to the prayers of the several days during which the feast lasted. The feast itself was called the Great Hosanna, and the term was more especially applied to the seventh day of the feast.

HOSE'A, the third (in the order of time) of the twelve minor prophets of the Old Testament, delivered his prophetical message, according to the inscription of his book, during the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah, and of Jeroboam II., king of Israel. Reckoning even from the last year of Jeroboam's reign (about 785 B.C.) merely to the first of Hezekiah's (about 725 B.C.), his career must thus have extended over nearly 60 years; but most—especially of modern scholars—seem inclined to regard this period as improbably long, though some calculations (e.g., Horsley's) make it even longer. Whether Hosea belonged to Judah or Israel, cannot be determined with certainty; but the greatest critics, with the exception of Maurer, maintain him to have been an Israelite. His prophecies, which are mainly directed against Israel, give a frightful picture of shameless idolatry, licentiousness, intemperance, falsehood, and eager inclination towards disadvantageous and demoralizing foreign alliances, and they may be regarded as appropriate to the period of anarchy and vice which followed the luxurious reign of Jeroboam II.

HOSEA, BOOK OF (*ante*). The term of 55 or 60 years from the latter part of Jeroboam II.'s reign to the first part of Hezekiah's, spoken of as marking the continuance of Hosea's prophetical office, though long, is not improbable or at all unprecedented. The style of the book has been described by critics as pointed, energetic, and concise. Jerome admired it for its great condensation and consequent brevity. But these very qualities in so ancient a writing often make the particular meaning obscure even when the general drift is plain. In so small a book, remaining as the only representative of so long a life's work, and recording prophecies that have no marks to distinguish the times of which they treat, it is not surprising that many passages are hard to be understood. The scope of the book is to reprove the nation generally, and the ten tribes in particular, for their gross idolatry and other aggravated sins; to foretell the rejection and captivity of Israel if they persisted in their evil, and to call them to repentance with promises of future restoration and ultimate conversion. The 14 chapters admit of being divided, somewhat more particularly, into five parts: I. i.—iii. The spiritual unfaithfulness of Israel is figuratively represented; yet a remnant of them, it is promised, shall be saved; consequently they are exhorted to forsake idolatry. Prom-

ises follow concerning their conversion to faith in the Messiah, and the gracious purposes of the Lord towards them are figuratively set forth. II. iv.—vi. 3. The prophet condemns the bloodshed and idolatry of Israel, and warns Judah against pursuing a similar course. He threatens divine judgments upon the priests, princes, and people; yet holds out promises of pardon expressed emblematically by the morning, the rain, and the resurrection, with remote reference to the resurrection of Christ on the third day. III. vi. 4—viii. The prophet utters God's complaint concerning the obstinate idolatry and other sins of the people, and says that, notwithstanding their reliance on Egypt, they shall be carried captive into Assyria. IV. ix.—xiii. 8. The captivity and dispersion of Israel are again foretold. The people are reproved for their idolatry, yet are not to be utterly destroyed. Their return to their own land is promised, even while threatenings against their idolatry are renewed. V. xiii. 9—xiv. After denunciations of divine judgments mingled with promises of deliverance from captivity, the prophet exhorts Israel to repentance, furnishes them with a model of prayer adapted to their situation, and foretells their abandonment of idolatry together with their subsequent restoration and conversion.

HOSHUNGABAD', a t. in central India, stands on the left or s. bank of the Nerbudda, in lat. 22° 44′ n., and long. 77° 44′ east. Pop. '72, 11,613. It is a town of considerable commercial importance, and is the capital of a district of the same name in the Central Provinces, which has an area of 4,222 sq.m., with a pop. of 440,186. Besides being so fertile as to be styled the garden of the country, it possesses abundance of excellent coal.

HO'SIERY, in its most limited sense, refers to the manufacture of stockings (hose); but in its more general application it comprises all knitted goods, whether made by hand or by machinery. The use of stockings originated in the cold countries of the north, and probably the first were made of skins, and subsequently of cloth; they were also, until a comparatively late period, made all in one piece with the trousers, constituting the trunk-hose of our ancestors; but these garments were separated; and the art of knitting was invented, it is supposed in Scotland, about the commencement of the 16th century. Certain it is that knitted stockings found their way to France from Scotland, and led to the establishment of a guild of stocking-knitters, who chose for their patron saint St. Fiacre of Scotland. In 1589 William Lee, of Woodbridge, Nottinghamshire, entirely altered the hosiery trade, by inventing the knitting-frame; and although he did not live to enjoy much benefit himself from it, it soon became a very important aid to the commerce of this country. During the protectorate, the stocking-frame knitters obtained a charter, and extended their operations through the provinces of England, but with all the disadvantages of a monopoly, which eventually led to legal proceedings, by which the charter was set aside in 1753. Since that time, many improvements have been made in the stocking-frames, and it may be fairly said that four-fifths of the stockings now worn through the world are made by the manufacturers of Great Britain. The ingenious contrivances by which this vast work is produced will be described under STOCKING-FRAME.

Stockings are made of cotton, of worsted, or of cotton and worsted mixed, called angola, and of silk. They are each made of two distinct kinds. The best are made in a flat web, which has to be sewn at the back as well as the foot, and it is so made that when the two edges are brought together at the back, they give the form of the calf. The common or *racked* stockings are woven in a circular frame, and form a cylindrical web of equal width from top to bottom; these have to be stretched on boards to give them the shape, and are ironed with hot irons whilst on the board, to make them retain the shape of the board. The foot is formed by cutting the web and adding a small piece for the sole. Nottinghamshire, which gave birth to the inventor of the stocking-frame, is still the center of the hosiery trade in Great Britain. At Belper, in Derbyshire, stockings of very fine quality are produced; but the cheaper sorts of stockings, gloves, singlets, etc., are made in Nottingham or its immediate neighborhood.

HOSIUS, "THE SAINT" (256–359), b. either in Egypt or Spain, became bishop of Cordova about 296 A.D., and retained the office more than 60 years. He was a member of a council held at Elvira, near Granada, about 305. Having suffered persecution during the reign of Diocletian and Maximian, he was greatly honored for his steadfast faith. He is said to have contributed to the conversion of Constantine by showing him that Christianity excelled heathenism in being able to grant forgiveness even to the greatest sinners. The emperor afterwards continued strongly attached to him, and in 324 sent him to Alexandria to mediate between the bishop of that city and Arius, as well as to settle the dispute concerning the observance of Easter. His mission having proved too hard for him, in the following year the council of Nicæa was called for the purpose of considering both subjects. Of this council Hosius was either the president or, at least, one of its presiding officers. Baronius claims that he was also the pope's legate; this claim, however, is generally denied, with the admission that through his exalted character and great influence in the west he perhaps in some degree unofficially represented the pope. At the close of the council he drew up or, as some say, announced the decree, signed it first and prevailed on the emperor to sanction it. He was president of the council of Sardica, called in 347 by Constantius and Constans at the desire

of Athanasius. In 355 Constantius requested him to join in condemning Athanasius, but, instead of doing so, Hosius earnestly defended that zealous champion of the orthodox faith. Having persisted in this course a second and even a third time, he was, at the close of the year, banished by the emperor. Two years afterwards he was summoned to attend the council of Sirmium, where, worn out with extreme age and hardship, he was prevailed on to sign a document favoring Arianism, yet he steadfastly refused to condemn Athanasius. Having then been allowed to return to his home and office, he died two years after, at the age, probably, of about 103 years. Athanasius and Augustine extol his character, and attribute his partial and late compliance with the imperial demands to the infirmity of age.

HOSMER, HARRIET, an American artist, was b. at Watertown, Mass., in 1831. As she had a feeble constitution, her father, a physician, encouraged her to strengthen it by outdoor exercises, and she became an adept in shooting, riding, rowing, skating, and swimming. She also showed a talent for sculpture by modeling figures in clay. To prepare herself for her chosen career, she studied anatomy, first with her father and afterwards at the medical college at St. Louis. Returning to her home in 1851, she modeled her first work, "Hesper," which had so decided a success that she was sent to Rome, where she became the pupil of Gibson. In his studio she modeled busts of "Daphne" and "Medusa," and a statue of "Œnone" and the much-admired statue of "Beatrice Cenci" for the mercantile library of St. Louis. Copies of her statue of "Puck," of which there are about 30, were ordered by the prince of Wales and the duke of Hamilton. Her most ambitious work is a colossal statue of "Zenobia in Chains." The "Sleeping Faun," exhibited in Paris in 1867, is one of her best works.

HOSPICE, the name given to the pious establishments kept up by the monks on some of the Alpine passes, for the purpose of affording assistance and shelter to travelers. The oldest of these is that on the great St. Bernard (see BERNARD, GREAT ST.), which the priests of the canton of Valais gained possession of in 1825, and afterwards fitted up in a comfortable manner. A hospice likewise existed on St. Gothard as early as the 13th century. At present, however, it is inhabited not by monks, but by a hospitaler, who entertains travelers gratis, and accepts no remuneration beyond a present. Similar establishments are found on Mont Cenis, the Simplon, and the little St. Bernard.

HOSPITAL, in law, is used in England to denote an eleemosynary corporation founded for the purpose of supporting certain descriptions of persons; whereas in Scotland it more frequently signifies a mortification or endowment for the education as well as support of children. In both countries it is also used, popularly, to denote an institution for dispensing medical assistance to the poor gratuitously.

HOSPITAL, DAMES OF THE. See SISTERS OF CHARITY.

HOSPITALERS, charitable brotherhoods founded at various times and in different countries, for the care of the sick in hospitals. The vow to devote themselves to this work of mercy is, in all these brotherhoods, superadded to the ordinary vows of poverty, chastity, and obedience, which are common to all the religious orders in the church of Rome. One of the earliest recorded instances of a hospital served by such a brotherhood is that of Constance in the 13th century.

The knights of St. John (q.v.) of Jerusalem, as also the Teutonic knights (q.v.), were originally hospitalers. The hospitalers of Our Lady of Christian Charity were founded near Chalons in the end of the 13th c. by Guy de Joinville; a similar body at Paris in 1294; and the hospitalers of Our Lady Della Scala about the same time at Siena. The history of the brethren of mercy, founded by ST. JOHN OF GOD, will be found under that name. There are many other local institutes or congregations, all of which, however, recognize the same general rules and follow the same general organization.

HOSPITALS are so called from the mediæval *hospitia*, or more properly the class of hospitals established very generally for the reception and relief of lepers, whose malady was one of the scourges of Europe. These leper hospitals were very commonly in England and in Scotland called "spitals;" hence the frequency of such names of places as Spital, Spitalfields, etc. The leper hospitals, and other kinds of the old hospitia, disappeared with the improvement of society, and substitutes for them on a broader scale began to be established in the modern form of hospitals. Of public establishments under this general designation there are now, as is commonly known, three distinct classes—hospitals for the reception and treatment of the sick and hurt, hospitals for the board and education of children, and hospitals for the reception and permanent board of poor old persons of both sexes. Hospitals of these several classes are numerous and on a munificent scale in Great Britain, where they take the position of leading charities in the country. As, in the present work, the more remarkable hospitals receive some notice under their respective heads, we need here only offer a few general observations.

HOSPITALS for the sick and hurt are in some parts of England and Scotland termed infirmaries. Under whatever designation, institutions of this kind are now established in all parts of the civilized world, supported, as in England, on a principle of charity, or, as in France, chiefly from the funds of the state or the civic municipalities. The primary or more important object of all such institutions is to mitigate bodily suffering, whether that arises from natural or accidental causes, in which respect they are indis-

pensable as a refuge to all who are unable to pay for private medical or surgical aid, or as a convenient means of succor on emergencies to persons of every rank and degree of opulence. While such is the main object of these benevolent institutions, they are in numerous instances serviceable as schools for medicine and surgery; as such, no university at which these and kindred branches of learning are taught can be said to be complete without the adjunct of a well-organized hospital, where professors can practically educate their pupils by pointing out varieties of disease and injuries, and exemplifying methods of treatment. Hence the best specimens of hospitals are found in university towns—as in London, Paris, Edinburgh, and some other cities famed as schools of medicine and surgery. The older of the London hospitals are St. Thomas's, 1553; St. Bartholomew's, 1546; and Bethlehem, 1547. A considerable accession to the number took place in the reign of George II., when society became alive to the value of such institutions. It was at this period that the royal infirmary of Edinburgh was established (1736). The antiquity of British hospitals sinks into insignificance in comparison with that of some institutions of this kind on the continent. The Hôtel Dieu in Paris, which is alleged to be the most ancient hospital in Europe, was founded in the 7th c., and, long known as the Maison Dieu, received the benefactions of successive sovereigns. It is now conducted on a stupendous scale. Houses of this kind in France usually receive valuable aid from a religious sisterhood renowned for its practical benevolence, the sisters of mercy. A striking example of these women's unselfish and useful labors is furnished at the great hospital for the sick and hurt at Lyons, where the entire establishment —cooking, nursing, dispensing medicine, etc.—is gratuitously conducted by them.

In London, Paris, and other large seats of population the pressure for admission by patients, and likewise the necessity for classifying and properly attending to large numbers, have led to the establishment of hospitals for special departments of medical practice. Thus, besides the general hospitals, there are now lying-in hospitals, ophthalmic hospitals, consumptive hospitals, children's hospitals, etc.—each with its peculiar accommodation, and its appropriate staff of officials. Independently of these, there are hospitals for the treatment of mental maladies, of which Bethlehem and St. Luke's in London, and the establishments in Paris known as hospices, are examples. To this class of institutions belong lunatic asylums (q. v.), also asylums for the reception and treatment of naturally imbecile children; these last, though in operation for some time in France and Switzerland, being but of recent establishment in Great Britain. To all these institutions under civil administration are to be added those hospitals which are maintained by the English, French, and other governments for the military and naval services.

No part of the social economy of European countries is so perfect in its organization, so purely humane, and so unobjectionable on the score of promiscuous charity, as the institution of public hospitals or infirmaries. As means of relief and schools of medicine, they appear to be absolutely essential to every dense community; not the least of their valuable qualities being that, by their prompt and liberal action, they interpose to stem contagious distempers which, if unchecked on their outbreak, might visit and decimate families who are far removed above the need of gratuitous medical attendance. On this latter ground, as well as from sentiments of benevolence, the hospitals or infirmaries of England, Scotland, and Ireland are the objects of much solicitude to the general community; it being customary for wealthy individuals to bequeath sums towards their support, and for public subscriptions and church collections to be made for them annually. In some cases, besides the infirmaries so miscellaneously sustained, hospitals are erected and maintained wholly by endowment.

A leading peculiarity of medical hospitals is their good order and cleanliness. They are mostly large edifices, and though, in a sanitary point of view, best placed in airy situations, they are for the sake of convenience usually situated in the neighborhoods where they are particularly required. Internally they are arranged in wards, each under its own nurses, with general superintendents and a suitable body of servants. Being open night and day to receive pressing cases, there is a resident surgeon with assistants constantly in attendance. Scrupulous cleanliness, quiet, decorous conduct, exclusion of intoxicants and of miscellaneous visitors, are among the points principally attended to by the managers.

The Middlesex hospital, parish of Marylebone, may be taken as a fair specimen of a general hospital in England. It is a large building, disposed in the form of the letter H, which admits of thorough ventilation in all the passages. It comprehends 310 beds, of which 120 are for medical and 190 for surgical cases. Three wards are set apart for the reception of 26 poor women affected with cancer, a class of cases when seemingly incurable not usually admitted into general hospitals. The staff consists of three physicians, who take charge of the medical cases in the wards; a physician-accoucheur, who devotes himself to the diseases peculiar to women and infants, and who superintends the working of the maternity department; four surgeons, who take charge of the surgical patients; and assistant physicians and surgeons, who take care of out-patients. Resident house-surgeons and an apothecary with assistants attend to all emergencies in the absence of physicians and surgeons, and summon them if necessary. Attached to the hospital are a chaplain and secretary. The physicians and surgeons, who give their services gratuitously, act as professors in the medical college. The management is conducted by governors and a medical and weekly committee. In- and out-door patients are admitted by

letters of recommendation from governors or subscribers to the funds, but in cases of cancer and diseases of the eye, and in cases of emergency, the recommendation is dispensed with. The annual number of patients received into the hospital is about 2,100, and 18,000 receive attendance at their own homes. No lying-in patients are now admitted into the hospital, but about 800 poor women are yearly delivered at their own dwellings, by pupils and midwives, under the direction of the physician-accoucheur. The total expense incurred is less than £11,000, of which more than a half is from endowment, and the remainder from subscriptions, donations, legacies, and miscellaneous collections. A separate fund is provided to assist poor patients leaving the hospital who may be deficient in clothing or other necessaries.

As in some degree allied or auxiliary to hospitals, there are two kinds of establishments deserving notice. The first to be mentioned are public *dispensaries*, where, at stated hours, medical advice and medicines are given gratis to applicants; and though like other forms of charity liable to abuse, it is allowed that these institutions are of much value in the midst of poor communities, and also, like hospitals, are a means of staying the course of contagious distempers. The other institutions to be noticed are those called in France *maisons de santé*. These establishments are private hospitals for the reception and treatment of patients who are able and disposed to pay a small sum for board and medical or surgical attendance. A common charge is from three to five francs a day. Under the name of *sanatorium*, an attempt has been made to introduce this kind of institution into England, where, however, from various circumstances, including the generally good home-accommodation of the middle and sub-middle classes, the institution has not become so popular as it is in Paris.

Hospitals for the board and education of the young are more varied in character and more numerous in Great Britain than in any country in the world. Consisting for the most part of large and handsome buildings, placed in salubrious situations in the environs of cities, some are specially adapted for boys, some for girls, and less frequently they are for both; some are maintained by endowments from deceased benefactors, some by funds connected with trade incorporations, and some by casual donations and subscriptions. The oldest, and those on the most munificent scale, are of the class first mentioned; as, for example, Christ's hospital, London, and Heriot's hospital, Edinburgh. Donaldson's hospital, Edinburgh, belongs to this class; and so likewise does the Girard college, Philadelphia, which, costing for construction nearly two millions of dollars and giving accommodation to upwards of 300 orphans, is not excelled in point of architectural grandeur, or in munificence of private endowment, by any European hospital for children. In the whole of this class of institutions in Great Britain there is a similarity of arrangements. The inmates are assumed to be orphans, or the children of parents in reduced circumstances; they are admitted at about 6 or 7 years of age, and kept till about 14; they receive gratuitous board and education within the establishment; and they wear a uniform according to the fancy of the directors—the dress being in some instances in England antiquated and ridiculous. There is ordinarily a keen competition among parents and guardians to procure the admission of children into these hospitals, for the benefit to be secured is deemed equal to a gift of £200 to £500. Hence, as may be supposed, the charity, to call it so, is frequently abused. As residence within such establishments for a period of 6 or 7 years, interrupted only by holidays, involves a withdrawal to that extent from the family circle, serious objections have lately been taken to the marked and necessary deficiency of hospital training. On this ground, as well as from their pauperizing tendency, hospitals for children are suffering in public estimation; and extended in number beyond all reasonable bounds, as they are in Edinburgh and some other places, are remonstrated against as being inconsistent with a sound social economy.

Hospitals for indigent old men and women are found in several European countries, but nowhere are they so common as in Great Britain and the Netherlands, where begging is rigorously proscribed by the police, and almsgiving assumes the character of rates for support of the poor. The workhouses for the reception of parish paupers are the humblest variety of these hospitia, though as seen in some parts of England and Scotland they are on a vast scale of accommodation, adapted to the wants of unions or clusters of parishes. Considerably above these in point of comfort and liberality of management are the hospitals endowed by individuals or by incorporations for persons who once occupied a respectable position and have through misfortunes lapsed into decayed circumstances. Almost every city of any note in the United Kingdom has one or more of this species of hospital; the claim for admission being ordinarily a privilege of local burgesses or members of incorporated crafts. Analogous to this class of institutions was Greenwich hospital, for superannuated mariners connected with the royal navy, and the military hospital, Chelsea. In England there are numerous establishments called almshouses. These are of the nature of hospitals for indigent men and women of respectable character, but with this difference, that instead of all living in wards under one roof, the inmates are each provided with a small dwelling for him or herself, and receive the means of separate livelihood. These establishments, consisting of clusters of neat small cottages in contiguity, or of separate dwellings grouped in the form of a spacious building, abound in London and its vicinity, where they afford pleasing examples of the munificence of opulent benefactors and incorporated city

companies. At St. Cross, near Winchester, and at Coventry there are almshouses curious from their antiquity and external appearance. The noblest example of this class of institutions is the Charter-house, London, described in the present work.

HOSPITALS, MILITARY, establishments for the reception of the sick and wounded of an army. The smallest is the regimental hospital, under the medical officers of the regiment; next, there is the divisional hospital, presided over by staff medical officers, for the benefit of all the corps in the division; and, lastly, there is the general hospital, applicable to the whole force. In these hospitals the medical officers are responsible directly to the secretary of state for war for all purely medical functions. With regard to discipline, inspections, and other military duties, the principal medical officer is responsible to the commandant of the regiment or division, who in his turn is answerable to the general-in-chief for the state of the hospitals in his command. Soldiers while in hospital are subjected to a stoppage of 7d. a day from their pay, unless in hospital on account of wounds received in action or on service in the field; but their whole pay is stopped if detention in hospital be certified to have become necessary from their own misconduct. There are several large military hospitals at home—e.g., Netley (q.v.); fort Pitt, for lunatic soldiers; Woolwich, etc. In the French army the service of the field hospitals forms part of the intendance of the army, the medical officers in charge being under the supreme control of the intendant-general.

HOSPITALS, MILITARY (*ante*). The principles of hospital construction were pointed out by a commission of the French academy of sciences in 1778, and improved in several details by Miss Nightingale, Galton, and others, and in the late American and Franco-German wars. The general principles may be gathered from the following directions. The most important part of a hospital is the ward; that is, the special apartment, or system of apartments, for the reception and care of the patients. It should, if large, be arranged in separate pavilions of one, or at most not more than two stories. These buildings should be about 25 ft. wide, 14 ft. high, and of a length allowing not less than 100 square ft. per bed. In warm climates the height should be greater, and also the floor-space, allowing at least 120 sq. ft. per bed. No one ward should contain more than 32 beds. The windows should be opposite, reaching from 3 ft. above the floor to one foot from the ceiling, and occupy one-third of the wall-space. The floors should be of hard pine or oak (Georgia pine in this country), and perfectly tight. In regard to the walls there are differences of opinion, but it is probable that a plastering of mortar over laths, whitewashed with milk of lime, is the best, on account of its absorbing power, noxious gases being undoubtedly disposed of in this way by oxidation within the porous spaces. A plan of hospital was not unusual in the armies during the late war of the rebellion in America, in which the wards or pavilions were disposed in a radiating form around a circular court, from 100 to 150 ft. in diameter, according to the size of the hospital. A plan of Hicks hospital near Baltimore, Md., is sometimes given as a model. This has a mess dining-room in one of the radiating buildings, rather larger than the others, and the offices and other administration buildings in the court. A better plan was carried out in the hospital at Point Lookout, Md., in which the administration apartments, dispensary, mess-rooms, and surgeons' quarters were placed in a large building occupying a site among the other radiating buildings. The advantage is apparent in the open court that is unobstructed in regard to currents of air, and in the greater cheerfulness of the arrangement, which admits of a free view from one ward to all the others, allowing the convalescent patients who may be sitting in their respective porticoes to greet each other; for wounded and sick soldiers, when they are able to be so, are a very social fraternity. The central court can then be laid out in plats of grass and flower-beds, in the care of which the patients take great pleasure during their often long confinement and absence from family. The plan of the Lincoln hospital at Washington was the arrangement of the wards in the form of an isosceles triangle, they being placed *en echelon*, with the base of the triangle being left open. The triangular space between the wards was occupied by the various administration buildings.

HOSPITALS, NAVAL, establishments for the cure of sick and wounded seamen. They are served by naval medical officers. The naval hospitals at home which are at present kept up are at Haslar (q.v.) and Plymouth, Yarmouth, Haulbowline, Dartmouth, and Portland; but abroad there are such establishments at Malta, Bermuda, Halifax, Trincomalee, Jamaica, Esquimault, the Cape, Hong-Kong, Yokohama, and Lisbon. The annual cost of the naval hospitals amounts to about £65,000.

HOSPODAR, a Slavonic title once commonly given to the governors of Moldavia and Wallachia, whereas the prince of Romania is now known under the native Romanic title of *domnu*. Another Slavonic term, *wojewod*, was also often given to the hospodar, the term wojewod signifying the right and dignity of leading the army (being thus identical with duke), while hospodar (gospodar, gospod, gospodin, in the various Slavonic dialects) means simply master (dominus). Formerly the Lithuanian princes were likewise called *hospodars*, and the Polish kings, down to the time of Sobieski, assumed this title in their diplomatic negotiations with Russia. *Gosudar* (ruler, monarch) is even now the title of the emperor of Russia, and in conversation signifies master. See MOLDAVIA AND WALLACHIA.

HOST (Lat. *hostia*, a victim), the name given in the Roman Catholic church to the consecrated bread of the eucharist. It is so called in conformity with the doctrine of that church that the eucharist is a "sacrifice," in the strict sense of the word. The host in the Latin church is a thin circular disk of unleavened bread, made of the finest flour, and generally bearing some emblematic device, as the crucifixion, the lamb, or some words or initials of words having reference to the sacrifice. In the Greek and other oriental churches, as well as in the various Protestant communities, the eucharist is celebrated in leavened bread, only differing from ordinary bread in being of a finer quality; and one of the grounds of separation from the west alleged by Michael Cerularius was the western practice of using unleavened bread. The Greek and Protestant controversialists allege that, in the early church, ordinary or leavened bread was always used, and that our Lord himself, at the last supper, employed the same. Even the learned cardinal Bona and the Jesuit Sirmond are of the same opinion; but most Roman divines, with the great Mabillon at their head, contend for the antiquity of the use of the unleavened bread, and especially for its conformity with the institution of our Lord, inasmuch as at the paschal supper, at which "he took bread, and blessed, and brake it," none other than the unleavened was admissible (Exod. xii. 8, 15; Levit. xxiii. 5). See Klee's *Dogmatik*, iii. 190.

HOST, JENS KRAGH, a Danish historian, b. at St. Thomas, Sept. 15, 1772; d. Mar. 26, 1844. The great aim of his literary career was to create a conviction of their unity among the Scandinavian nations. With this view, he established, in company with Nyerup, Pram, and Baggesen, the Scandinavian literary society, which originated the journal entitled the *Scandinavian Museum*. His most important work is *Count Struensee and his Ministry*, (3 vols., Copenh. 1824), which was the first attempt to delineate, in a thoroughly impartial manner, the events of that singular period in Danish history. Among his other writings are: *Svenske Blade; Euphrosyne; Dannora; A Swedish Grammar and Dictionary for Danes; Lectures on the Swedish Language and Poetry; Life and Government of Gustavus Adolphus; Memorials of the Life and Government of Christian VII.;* and *History of the Danish Monarchy under Christian VII.*

HOSTAGE (through the French *ôtage* (ostage), from the Latin *obses*), one given in pledge for the performance of conditions. When a town capitulates, victors and vanquished usually give into the custody, one of the other, several officers, as pledges that each party will duly carry out the terms stipulated. When the terms are fulfilled, the hostages are exchanged; but if the terms be evaded, the opposite side holds the right to put to death or otherwise punish the hostages in its possession. It is needless, however, to add that, in modern civilized warfare, the circumstances would have to be very remarkable indeed to be held to justify so cruel a measure as the execution of a hostage.

HOSTILIUS, TULLUS, grandson of Hostus Hostilius, the champion of Rome in the first war with the Sabines, succeeded Numa Pompilius on the throne of Rome, 670 B.C. According to Livy and other writers, Hostilius made the famous arrangement, by the combat of the Horatii with the Curiatii, for the decision of the question of supremacy between Rome and Alba, which was decided in favor of the former; he fought against Fidenæ and Veii, and conquered these cities, destroyed Alba, and removed the inhabitants to Rome, giving them Mt. Cælius to dwell on, and carried on war against the Sabines. As he grew old, he became more pacific in his inclinations, and determined to attend more diligently to the worship of the gods, but he had too long provoked them by his negligence to be forgiven, so that, when he wished to inquire of Jupiter Elicius, the god consumed Hostilius and his house with fire, about 638 B.C. According to Niebuhr, Arnold, etc., there are glimpses of a distinct personality in the legend of Hostilius, unlike those of Romulus and Numa, which are merely personifications of the two principal stages of a nation's growth.

HOT-AIR ENGINE. See CALORIC ENGINE, *ante*.

HOTBED, a heap of fermenting matter, covered with a layer of earth, and generally surmounted with a frame, for the cultivation of plants which require more than the natural heat of the climate and season, but not so much as to render the hothouse necessary. The heat is the result of fermentation. Hotbeds, not being expensive, are in very general use; as for growing melons and, in the northern parts of Britain, cucumbers, for raising ornamental plants from seed in spring, to be planted in the open ground as summer advances, etc. The material mostly used is stable-dung, or a mixture of horse-dung and litter; but tanners' bark, leaves, the waste of flax, cotton, or woolen factories, etc., are sometimes substituted for it. The heat of a very rapid fermentation being too great, it is necessary that this be over before the hotbed is planted; and it is usual, on this account, to prepare the materials for some time before it is formed. A hotbed is made highest at the back, sloping—in the northern parts of the world—towards the south. The bed extends on all sides 6 in. or thereby beyond the frame, which has a movable glass sash or sashes, according to its size. The thickness of the hotbed, and of the earth upon it, are accommodated to the purpose intended and the degree of heat required. When the heat decreases, it is for some purposes necessary to keep it up by *linings* of the same material as the hotbed added to the sides of it.

The sashes of hotbeds must be partially removed during the day, to permit ventilation and the escape of vapor.

HOTCHPOT, a phrase used in English law to denote that where one child has already received an advancement out of the father's personal estate, that child must bring such sum into hotchpot before he will be allowed to share with the other children, under the statute of distributions, after the father's death. In other words, a child who has got money from the father to place him in business, etc., must treat that as a payment to account of his share at the father's death. A similar but not identical doctrine exists in Scotland under the name of collation (q.v.).

HOTCHPOTCH, a Scottish dish, may be defined as a kind of mutton-broth in which green peas take the place of barley or rice. This is a dish only to be obtained in perfection in summer, when green peas are in season. Put on two quarts of water, and when it boils put in 3 lbs. of the back-ribs of mutton or lamb, paring off the fat if there be too much. Put in with the meat two or three carrots cut into squares, and two grated, also three or four sweet young turnips in squares, a cauliflower and a lettuce cut down, a few young onions shred, a little parsley, and about a pint of sweet young peas. Boil this for an hour and a half, then take out the meat and cut it in chops, laying it aside. Add another pint of young peas, seasoning with pepper and salt; and when these peas are done, put in the chops. In a few minutes afterwards, serve up the whole in a tureen. Instead of cutting the meat into chops, it is not unusual to keep it whole and serve it separately. Neck of mutton makes excellent hotchpotch. The composition of the mess may be varied by the addition of beans, white cabbage sliced, or asparagus-points. Some boil the empty hulls of the peas in a little water apart, and add the strained liquor to the rest, which gives additional sweetness. Hotchpotch is considered the *chef-d'œuvre* of Scottish cookery.

HÔTEL, originally *hostel*, or *hostelrie*, a French term applied to an inn, or house for the temporary accommodation of travelers. The term, however, is also applied in France to the town mansion of a distinguished personage, and in like manner the word inn was at one time indifferently used in England to signify the town residence of a great man. The name hostelrie was applied by Chaucer to a public inn, and till a more recent period it was similarly used in Scotland. From its general use comes the designation hostler, which originally signified the keeper of the inn or hostel. Only in recent times has the significant old English word inn been eclipsed by the reintroduction of hostel, under the softened form of hôtel.

An account of inns ancient and modern, under whatever designation, would form an interesting chapter in social history. The caravansary (q.v.) of the east is the most ancient species of inn of which there is any notice. The Greeks and Romans did not improve on the quality of these oriental establishments. Their inns, if worthy of the name, were little better than receptacles for humble classes of wayfarers, or places where cooked food and wine were dispensed to the hungry and thirsty stranger. Along their highways the Romans gave encouragement to these primitive inns; the best of such establishments being called *cauponæ*, or *tabernæ diversoriæ*, while those of an inferior kind were known as *popinæ*, of which some specimens have been disclosed at Pompeii.

The duties of hospitality and also the obligations of religion long postponed the introduction of regular inns. In mediæval times the castles of the barons offered shelter with straw, and sometimes food, to the wayfarer of high and low degree, and there are traditions to the effect that to pass some of these strongholds without calling to render obeisance, and receive the hospitality of the owner, was deemed an insult. But the monastic establishments, great and small, scattered over every part of Christendom, formed the chief *hospitia* (see HOSPICE). With the general improvement of society and the increasing concourse of travelers came the modern inn, or professional hospitium, at which entertainment for man and horse was afforded as a matter of business. Nowhere in Europe did this class of establishments so soon attain to a determinate and respectable character as in England. Growing first into importance in London, York, Oxford, Bristol, and some other cities, the substantial and well-managed English inn was imitated on a smaller scale in the different provincial towns, and gained a good standing in national usage before it spread to Scotland; the inns of which, even up to the middle of the 18th c., were on a meager scale of accommodation. It is not necessary to call to mind more than a few of the interesting old inns in London, all celebrated less or more from their respective signs: the *Angel* at St. Clement Danes, and *Angel* at Islington; the *Bell*, Warwick Lane, Newgate Street; *Belle Savage*, Ludgate Hill; *Bull and Mouth*, St. Martin's-le-Grand; *Four Swans*, Bishopsgate Street; *Saracen's Head*, Snow Hill; *Golden Cross*, Charing Cross; *White Horse*, Fetter Lane; and *Tabard*, Southwark. All of these have either disappeared or have been changed in character. For the most part, the old inns of London, Westminster, and Southwark consisted of a building round a courtyard, entered from the street by a wide covered passage. The ground-floor was disposed as stables, kitchens, and other offices, with a large reception-room; above, were the lesser apartments and bedrooms, these last all opening on hanging wooden galleries, whence the inmates could look down on the busy scene of arrivals and departures in the courtyard beneath. Some specimens of

these old inns with open galleries still survive. Such was the *Tabard*, renowned as the hostelry from which Chaucer's pilgrims set out for Canterbury. There is reason to believe that this form of construction was derived from the arrangement of ancient Roman villas, which consisted of buildings round a series of courtyards; hence, also, the form of French hotels, public and private. Modern Italy has examples of inns of this form. We may allude particularly to the *Hôtel de Ville* at Milan, and the *Albergo delle Due Torri* at Verona; this last having hanging galleries round a courtyard in precisely the old English style.

Of the character and management of the inns of England, with their offers of "entertainment to man and horse," we are favored with innumerable glimpses in the fictions of Fielding, Smollett, Goldsmith, and others—the jolly hostess, the obsequious waiters, the bouncing chambermaids, the hostler who takes the traveler's nag, and above all the garrulous host, who, when invited, gives his company to his guests, tells them the news, and at dinner, according to use and wont, places the first dish on the table. See *Dr. Syntax's Tour in Search of the Picturesque*, illustrated by Rowlandson, for some humorous delineations of inn-usages. The great personal comfort and independence of feeling enjoyed in English inns is frequently referred to in literature. Archbishop Leighton, who died in 1684, in the *Bell*, Warwick Lane, "often used to say, that if he were to choose a place to die in, it should be an inn; it looking like a pilgrim's home, to whom this world was all as an inn, and who was weary of the noise and confusion of it. And he obtained what he desired."—Burnet's *Own Times*. Dr. Samuel Johnson, as is well known, expatiates on the delights of an English inn; on one occasion, as related by Boswell, repeating with great emotion Shenstone's lines:

> Whoe'er has traveled life's dull round,
> Where'er his stages may have been,
> May sigh to think he still has found
> The warmest welcome at an inn.

English inns have not lost their reputation for comfort and the attention paid to guests; but the almost entire alteration in the methods of traveling by the introduction of railways has left them considerably behind the requirements of the age. Except in the smaller towns and villages, they have been superseded by hotels—that is, houses of a more pretentious kind. The better classes of these hotels contain private parlors for families or individuals who choose to be alone, also a large apartment for travelers generally. Houses frequented by commercial travelers have a room set apart for this class of customers. The plan of taking meals at a *table-d'hôte* has not hitherto made much progress in England, as if it were somehow contrary to the national reserve and exclusiveness. The marked defect in the modern hotels in London and elsewhere in England consists in their insufficient size. The greater number are merely private houses transformed for the purpose, and are inadequate to meet the swollen dimensions of railway traffic. The truth is, the establishment of inns or hotels in any part of Great Britain has not hitherto been looked to as a profitable investment for a large capital. The business of innkeeping has been thought a little derogatory, and few except old waiters, who had realized some money by their services, embarked in the business. On the continent of Europe, the trade of hotel-keeping enjoys a considerably higher social status. A large capital is invested, the keeper or manager is a man of local note, and the waiters or *garçons* are young men who follow the business as a profession in which they expect to rise by their diligence and acquirements. In point of fact, the *garçon* is much above the English waiter in his aims. He voluntarily undergoes a kind of curriculum of education, by passing from the hotels of one country to those of another, and does not consider himself proficient till he speaks German, French, Italian, and English; at the very least, if of German birth, speaking French with fluency. Some good and capacious hotels, built distinctly as such, have lately been established at the principal railway termini in London, also at Dover and a few other places. With these exceptions, most English hotels are far behind the high-class hotels of the continent; such as the *Grand Hôtel* and the *Hôtel de Louvre* at Paris, the *Métropole* at Geneva, and some of the fine establishments at Hamburg. London is now gradually becoming better supplied. The *Euston*, the *Victoria*, the *Grosvenor*, the *Paddington*, the *Charing Cross*, the *Midland* (all connected with railway termini); the *Alexandra*, the *Palace*, the *Inns of Court*, and the *Langham* are exceedingly well-appointed hotels.

In England the hotel system of living is simply that of paying for what is called for, with the addition of a certain charge per diem for the rooms which are occupied; in France and other continental countries, this plan is so far modified by the plan of dining at a table d'hôte, which lessens the general expenses. Both in English and continental hotels, the charge for attendance is now made explicitly in the bill, a very grateful improvement. The ordinary hotels in all parts of the United Kingdom are licensed by magistrates to sell wines, spirits, and other excisable liquors, and therefore come under the category of public-houses open to the supervision of the police. In the higher-class hotels, however, the supply of liquors is confined to the resident guests; and it is only in the others that drink is sold as in taverns. See TAVERN. Latterly, there has sprung up a class of houses, some of them on a considerable scale, known as *temperance hotels*, which have no license, and do not supply any excisable liquors. See TEMPERANCE MOVEMENT.

Throughout the United States of America, the system of hotels has taken a peculiar turn. The hotels are built for the purpose, and usually very large; with few exceptions they are conducted as boarding-houses on the plan of charging so much per diem, everything included excepting liquor, which is obtainable in a large drinking-room called the bar. A common charge is about 10s. 6d. sterling a day. All the meals are given with liberal profusion in the table-d'hôte fashion; and as absence from these entertainments—to dine with a friend, for example—makes no difference of charge, the system, though simple and adapted to a constant flow of customers, is not without its disadvantages. Elegant in their architecture, and spacious and commodious in their interior arrangements, the American hotels are got up at great expense, as may be judged from their extensive accommodation, which ranges from 180 to 800 rooms. The *Astor House*, the *St. Nicholas*, and the *Metropolitan*, at New York, are among the largest and most splendid of these establishments. The system of American hotels is generally followed in the British colonies.

HOTELS, LAWS RESPECTING. See INN and INNKEEPER, *ante*.

HOTHO, HEINRICH GUSTAVE, 1802–73; b. Germany; a writer, and one of Hegel's most distinguished pupils, who became professor of the university of Berlin. He was extremely able as an art-critic, and was for many years director of the art collection in the royal Berlin museum. He published *Vorlesungen über Aesthetik; Geschichte der deutschen & nieder landischen Malerei, die Malerschule Hubert's van Eyck;* and several other able works on art.

HOTHOUSE, a building intended for the cultivation of exotic plants requiring a higher temperature than that of the open air. The term is sometimes employed to include even the greenhouse and conservatory, but more generally it is applied to those buildings in which artificial heat is kept up at all seasons of the year, as the bark-stove (q.v.), dry-stove (q.v.), forcing-houses, pinery, peach-house, etc. Hothouses resemble greenhouses in their general form and structure, and with most of the same varieties in both. It is important that they have a good exposure, so that the plants may enjoy as much sunshine as possible; and the free admission of air to the utmost extent allowed by the requirements of climate, is very advantageous. The oldest mode of heating hothouses is by furnaces and flues; the other modes practiced are by steam, or by hot water led through the house in tubes, and by hot air admitted into the atmosphere of the house. Into the details of these modes we cannot enter.

HOT SPRINGS, a co. in s.w. central Arkansas, intersected by the Ouachita river, and the Cairo and Fulton railroad; 900 sq.m.; pop., '70, 5,877—650 colored. The surface is hilly and is to a large extent covered with forests. The chief productions are corn, cotton, and pork. Co. seat, Rockport.

HOT SPRINGS, a small t. in Arkansas, U. S., 45 m. w. by s. of Little Rock, and celebrated as a resort for invalids to the hot springs which give the name to the village and the county. Fifty-seven springs, from 93° to 150° F., break out from the w. side of a mountain, and flow into a creek which empties into the Wachita river, 6 m. distant. There are also cold chalybeate springs, much frequented, and sulphur springs in the same county. Pop. '70, 1276.

HOTTENTOT COUNTRY, a region of s. Africa, stretches indefinitely to the n. from the Cape colony, having the Atlantic on the w. and the Bechuanas and Kaffers on the e. In e. long. it extends between 15° and 27°, and in s. lat. between 31° and some line to the n. of the tropic of Capricorn. This territory is but of little value. Its principal river, the Orange, is almost useless for navigation; and though here and there well wooded, yet the surface is chiefly an arid desert. The only examples of civilization are to be found in several missionary establishments.

HOTTENTOTS is the name generally given by Europeans to a singular race of people, supposed to be descended from the aborigines of southern Africa, and now dwelling for the most part in and about the English settlement of the cape of Good Hope. The origin of the name Hottentot is uncertain. Some think it is of Dutch origin; a word coined by the early Dutch settlers to convey by the sounds hot *en* tot, hot *and* tot, some idea of the peculiar clicking noise made by the people when speaking. Dampier, however, wrote the name *Hodmadods*, instead of Hottentot; and Prichard says that it is probably a corruption of *Houteniqua*, the name of a particular tribe now extinct, or at least unknown. They now call themselves by various names, supposed to be those of tribes, as Attaquas, Hessaquas, Dammaras, Saabs or Saaps, Namaquas, and Koranas; and by the collective name of Quai-quæ, or Gkhuigkhui.

In the ethnological classification given by Dr. Latham, the Hottentots are ranged under the second great division of the human family—Atlantidæ. In the older classification, that of Blumenbach, they are ranged under the third great division of the human race—the *Ethiopians*—under which division that author also places the negroes. But the Hottentots are not like the negroes, and are more akin to the Mongolians; having broad foreheads, high cheek-bones, oblique eyes, and a dirty, olive-colored complexion. The width of the orbits, their distance from each other, the large size of the occipital foramen, are points in which the Hottentots resemble the northern Asiatics, and even the Esquimaux. The person of the Hottentot, when young, is remarkable for

its symmetry. The joints and extremities are small, and the males look almost as effeminate as the women. The face, however, is in general extremely ugly, and with age this ugliness increases. Sir John Barrow, in describing the Hottentot women, observes of them that before child-bearing they are models of proportion, every joint and limb rounded and well turned, their hands and feet small and delicate, and their gait by no means deficient in grace. "Their charms, however, are very fleeting. At an early period of life, and immediately after the first child, their breasts begin to grow loose and flaccid, and as old age approaches become distended to an enormous size; the belly protrudes; and the hinder parts swelling out to incredible dimensions, give to the spine a degree of curvature inwards that makes it appear as if the *os coccygis*, or bone at the lower extremity of the spine, was elongated and bent outwards, which is not the case." The appearance of the Bosjesmen, or Bushmen, who are the most degraded tribe of the Hottentots, is still more revolting.

The language of the Hottentots is quite as singular as their personal appearance. It has been called "the click language," and has also been compared to the clucking of a hen when she has laid an egg. The dress of the Hottentot in his native state is exceedingly simple, being merely a strip of the skin of some animal tied round the waist, from which there depends a sort of apron that hangs down both before and behind. This is nearly the same for both sexes, so that in the summer both go almost naked, protecting their persons from the sun by a covering of grease; but in the winter they have a sort of cloak made with skins, that covers nearly the whole body. The Hottentots live in kraals, or villages, consisting of a number of circular huts like beehives. They have both oxen and sheep, in the managemeut of which they show great skill. They are also addicted to the chase, in which they use poisoned arrows, javelins, and spears. Their only manufacture is a rude kind of earthenware; except, of course, that they make their own sheepskin clothes, such as they are, also their bows and arrows, and other weapons. Like most savages, they have some taste for music, which they practice upon a rude sort of guitar with three strings, and a flute made of the bark of trees. Of religion there appears to be but very little notion among the Hottentots, and they have no particular observances at either births, marriages, or funerals. Dr. Prichard, however, observes of them: "Although the wild tribes of the Hottentot race display ferocity and all the other vices of savage life, yet we have abundant proof that these people are not insusceptible of the blessings of civilization and Christianity. No uncultivated people appear to have received the instructions of the Moravian missionaries more readily than the Hottentots, or to have been more fully reclaimed and Christianized."

The Hottentots, as a distinct race, first became known to Europeans about the year 1509, when Francisco d'Almeyda, viceroy of India, landing at Table bay, was killed, with about seventy of his followers, in a scuffle with the natives. They were afterwards frequently visited by navigators from different countries; but no authentic accounts reached Europe respecting them until the Dutch settled in the cape of Good Hope in the middle of the 17th century. The Hottentots were then much more numerous than at present, but upon becoming addicted to rum and brandy their numbers diminished gradually. Many of the tribes parted with their flocks and herds to procure the fire-water, and eventually they became the absolute slaves of the Dutch settlers, or Boers. From this condition they have been delivered by the enlightened and humane policy of the British government; and as free laborers they make excellent herdsmen and drovers. Their number at present is thought to amount from about fifteen to twenty thousand, not including those who in all probability may be found dwelling more in the interior. Of the Bushmen no numerical estimate has been formed. They are widely scattered throughout the English settlements, but their numbers must be very small, while their wretched and degraded habits are such that it is thought they will soon become utterly extinct.

HOTTENTOT'S BREAD, *Testudinaria elephantipes*, a species of yam, indigenous to s. Africa. Slender, vine-like stems grow to a height of 30 or 40 ft., with many branches bearing bright, heart-shaped leaves. The root-stock stands conspicuously above ground, hemispherical or nearly globular in shape, and sometimes 3 ft. in diameter, covered with a brown, cork-like substance with many-sided protuberances separated by deep cracks and fissures. From fancied resemblances of this characteristic root-stock, the plant is sometimes called elephant's-foot, according to its systematic name, and sometimes tortoise-plant. The fleshy interior affords food to baboons and other animals, but it is said that the natives do not eat it. The dormant root-stocks are imported apparently dead, but when placed on the ground soon throw out rootlets, while stems grow rapidly from the upper surface. It is cultivated as a greenhouse curiosity, and its branching stem and pleasing foliage make it a favorite greenhouse climber.

HOTTINGER, Johann Heinrich, 1620–67; a Swiss orientalist and biblical scholar. He first settled at Groningen, and afterwards at Leyden, where he became assistant to Golius, the best orientalist of that age. He also took lessons in Arabic and Turkish from Ahmed Jon Ali, a Mohammedan from Morocco, of whom he often speaks in his works. Golius had hoped to take his pupil with him to the east, but the senate of

Zurich interfered, and Hottinger, after visiting France and England, returned home. In 1653 the chairs of rhetoric, logic, and scriptural theology were offered to him, and he had only filled them for two years, when, at the urgent request of the elector of Palatine, he was permitted to remove to Heidelberg for three years. He there taught the eastern tongues and biblical criticism with such success and distinction as to revive and spread the fame of the university. Prolonging his stay in the Palatinate till 1661, he returned to Zurich in that year, and was made rector of the university. His reputation still continued to increase, and in 1667 he received such flattering offers from Leyden that he resolved to accept them. Before setting out for this new sphere of labor the boat on which he was crossing the Limath, with his wife and family, was upset, and Hottinger, who might have saved his own life, was drowned in attempting to save that of his wife.

HOTTO'NIA, a genus of plants of the natural order *primulaceæ*, of which one species, *hottonia palustris*, water violet or featherfoil, is among the most beautiful of British aquatic plants. It is not found in Scotland. Its leaves are all submerged, crowded, and much divided; the large beautiful, pale purple, whorled flowers alone rise above water on a long cylindrical stalk. Other species of hottonia are found in the east.

HOT WALLS, or FLUED WALLS, in gardening, are walls furnished with furnaces and flues, in order to the production of finer kinds of fruit than could otherwise be expected in the climate. The flues are led as obliquely, and make as many turns from right to left as are consistent with their drawing well, so that as little heat as possible may escape by the chimney, and as much as possible may be expended on the wall. The heat is applied chiefly during spring. At that season, also, movable glazed frames, or sometimes mere screens, are placed in front of the walls.

HOUA'RIOS are small coasting-vessels and pleasure-boats used in parts of the Mediterranean. They bear lateen sails, and have each two masts and a bowsprit.

HOUDIN, ROBERT, 1805–71; b. Paris, and was educated for a lawyer, but at his own request followed his father's trade of a watchmaker. He constructed mechanical toys for the exhibition of Paris in 1844, which were awarded medals. He had an enthusiasm for all feats of conjuring, and originated his *Soirees fantastiques*, or magical performances, for which he afterwards became famous in Europe and America. He visited Algeria at the instance of the French government, with a view of ascertaining how the priests there performed the wonders with which they incited the people to rebellion, and succeeded in surpassing all their marvels, and counteracting their seditious influence. He published his autobiography and his *Confidences*, which were translated into English.

HOUDON, JEAN ANTOINE, 1741–1828; b. Paris; one of the most famous modern French sculptors, excelling in busts or portraits. Among his subjects were Voltaire, Cicero, Napoleon, Josephine, Ney, Rousseau, Diderot, Mirabeau, Franklin, Turgot, and George Washington. His statue of the latter is in the capitol at Richmond, Va. He visited the United States in 1785 with Franklin, and was for some time Washington's guest.

HOUGHTON, a co. in the n.w. part of the peninsula of Michigan, lying along lake Superior and embracing Portage lake, which is connected with lake Superior by a canal; 2,000 sq.m.; pop. '80, 22,473. The surface is hilly; agriculture is much neglected, the main business of the people being copper-mining. The mines of the region are the richest in the world. Co. seat, Houghton.

HOUGHTON, the capital of the co. of the same name in Michigan, on Portage lake, 10 m. from lake Superior, to which there is a ship canal; pop. 1540. There are some manufactories, but the copper trade is the chief business, this being the center of the richest mining district in the country.

HOUGHTON, RICHARD MONCKTON MILNES, Lord, b. England, 1809; graduated at Cambridge, and was elected to parliament in 1837 as a supporter of Peel. He afterwards joined Russell's party, but declined office under Palmerston. His attention was mainly directed to foreign affairs and the reform of penal institutes. He brought in the first bill for the establishment of juvenile reformatories in 1846, and is the president of the great reformatory establishment at Red Hill. In 1873 he presided over the Norwich meeting of the social science congress. He has written several volumes of poems, under the title of *Poems of Many Years; Palm Leaves*, etc., and many pamphlets—notably, *One Tract More*, in the Oxford controversy of the *Tracts for the Times;* and the *Real Union of England and Ireland*, advocating concurrent endowment of the Protestant and Catholic churches. His last work is *Monographs, Personal and Social.*

HOUGHTON, WILLIAM, b. England, 1807; graduate of a London college. In 1833 he became minister of a Congregational church, and in 1855 was chosen president of the Congregational union of England and Wales. He has been a great traveler and is the author of *The Ecclesiastical History of England*, and *Country Walks of a Naturalist with his Children.*

HOUGH'TON-LE-SPRING, a t. of the co. of Durham, England, nearly 7 m. n.e. from Durham, on the Great Northern railway. The town of Houghton-le-Spring has recently

much increased, and owes its prosperity mainly to the numerous coal-mines of the neighborhood, the coal produced by which is of the most excellent quality. Pop. '71, 5,276. The surrounding district is very populous, and contains numerous villages.

HOULTON, the seat of justice of Aroostook co., Me., situated at the terminus of the New Brunswick and Canada railroad, the most northerly settlement of any consequence in the wild n.e. region of the state; pop. of township, 2,850. In the village are the Houlton academy, half a dozen churches, and a number of manufactories. It is about 100 m. n.e. of Bangor.

HOU-NAN', or the HU-NAN, one of the provinces of s. central China; 74,325 sq.m.; pop. 18,652,507. The surface is rough, and the region is little known to Europeans. The chief town is Chang-Sha.

HOUND (Ger. *hund*), a name commonly given to those kinds of dog which are used in hunting, but more especially, at least by systematic writers on dogs, to those which hunt by scent rather than by sight. When this definition is adopted, greyhounds are not regarded as true hounds. Examples of true hounds are found in the bloodhound, the old English southern hound, the staghound, the foxhound, the harrier, and the beagle; closely allied to which are also the pointer, setter, spaniel, etc. See these heads. The hounds are by some naturalists regarded as a distinct species of dog (*canis sagax*). They are characterized not only by fineness of scent, but by great docility and sagacity. The muzzle is not so sharp as in greyhounds, nor is the form so slender. The ears are large and pendulous. Some varieties have rough, and some have smooth hair. The rough-haired varieties are generally those which exhibit the most perfect domestication, and in which the attachment to man is closest. True hounds are figured in ancient Egyptian paintings and sculptures. It is believed that all the best varieties were introduced into Europe in comparatively recent times from the east.

HOUND FISH, a name given to certain kinds of sharks, as the *mustelus lævis*, or smooth hound fish of European waters, and its American representative, the *mustelus canis* of DeKay, the dog shark, a rather larger fish than the former, being from 2 to 4 ft. in length. They are sometimes spoken of as a larger kind of dog fish; but the dog fish belongs to the genus *acanthias*. See DOG FISH and SHARK, *ante*.

HOUNDS, in point of law, render the person who keeps them liable to the dog-tax—viz., five shillings each—unless compounded for; but a person who follows the hounds, i.e., goes out hunting with them, does not require a game license. Though such a person, however, is not punishable summarily by a magistrate for an illegal trespass when following the hounds on a stranger's lands, yet he is liable to an action at law for the trespass, except only in the case of fox-hunting, which to this extent may be called a privileged pursuit, at least in England. In Scotland, fox-hunting is not allowed as an excuse for a trespass; and in England and Ireland, even in following the fox-hounds, no more damage is to be done than what is absolutely necessary.

HOUND'S-TONGUE, *Cynoglossum*, a genus of plants of the natural order *boragineæ*, of which there are many species, all of a coarse appearance, with small flowers. The COMMON HOUND'S-TONGUE (*C. officinale*) is a native of Europe, Asia, Africa, and North America; not uncommon in some parts of Britain, especially near the sea-coast. It has soft downy leaves, of a dull-green color, purplish-red flowers, and a stem about 2 ft. high. Its odor is very disagreeable. The root was formerly administered in scrofula, dysentery, etc., and is said to be anodyne. It is also one of the pretended specifics for serpent-bites and hydrophobia.

HOUNSLOW, a small t. of England, in the county of Middlesex, consists of a single street, stretching along the Great Western road from London, from which it is distant 10 m. west. Its church, a modern building in the Italian style, is surmounted by 12 small spires and a belfry. The numerous inns and posting-houses of Hounslow were busy and prosperous till the opening of the railways to Southampton and Bath. Previous to that event, its posting business was as extensive as that of almost any town in England. About 800 horses were then maintained here, and about 183 coaches, while 500 coaches passed through the village daily. The heath, formerly notorious as the scene of highway robberies, is now in great part inclosed. Numerous villas have risen up around the town. On the heath are extensive gunpowder mills, cavalry barracks, and an arsenal. Pop. '71, 9,294.

HOUR, a measure of time equal to $\frac{1}{24}$th part of a day. The division of the day into hours seems to have been known to the Babylonians and Egyptians, from whom, first the Greeks, and then the Romans derived it. But their scheme of division extended only to the natural day (while the sun was above the horizon), which they divided into 12 parts. The consequence of this was that the hour constantly varied in length. This system was introduced into Rome by L. Papirius Cursor about 293 B.C., and during the Punic wars, the Romans adopted the division of the night also into 12 parts. This system continued till about the end of the 4th c., when the present system was adopted. In the British empire, and most continental countries, the day is reckoned from midnight to mid-day 12 hours, and mid-day to midnight 12 hours. In Italy the day is reckoned from sunset to sunset, and the hours are counted from 1 to 24. The Chinese reckon from an hour (in our time) before midnight till the corresponding time next

night, 12 hours, each hour being equal to two of ours. The Japanese still follow the old custom of reckoning from sunrise till sunset. Astronomers reckon from mid-day (on the previous day) to mid-day, counting from 1 to 24.

HOÚRA, a t. on the right or w. bank of the Hoogly, stands within the limits of the 24 pergunnahs, in lat. 22° 36′ n., and long. 88° 23′ east. It is directly opposite to Calcutta, of which it may, in fact, be regarded as a suburb. The river between them is their common harbor; and Houra, being inhabited chiefly by ship-builders, bears pretty nearly the same relation to the aggregate metropolis of India as Blackwall bears to London in its largest sense. It is hence that the great railway takes its departure for the n.w. provinces.

HOUR-GLASS, an instrument for measuring intervals of time. It is made of glass, and consists of two bulbs united by a narrow neck; one of the bulbs is nearly filled with dry sand, fine enough to run freely through the orifice in the neck, and the quantity of sand is just as much as can run through the orifice in an hour, if the instrument is to be an hour-glass; in a minute, if a minute-glass, etc. The obvious defects of this instrument are the expansion or contraction of the orifice produced by heat or cold, and the variations in the dryness of the sand, all of which produce deviations from the true measurement of the time. The hour-glass was almost universally employed in churches during the 16th c., and continued in use till about 50 years ago. In several of the churches in England hour-glass stands of elegant workmanship are still to be seen.

HOURIS, beings of the Mohammedan paradise; virgins not of human flesh and blood, but formed of musk, and, by a special dispensation, eternally virgins. The name means literally "the black-eyed." In the fanciful story of the Koran these fair creatures dwell in pavilions of pearl, and repose on gorgeous couches. The pious Mohammedan, of however low an origin, is assured of at least 72 of these divine beings in paradise in addition to the wives who belonged to him while he lived on earth. The houris have the power to conceive and bear children at will, who within an hour grow to maturity.

HOURS, in mythology. See HORÆ.

HOUSATONIC, a river of New England, which rises in Massachusetts, and flows southwardly through Connecticut into Long Island sound. Its length is about 150 m., through a picturesque country, and its numerous falls afford water-power to many manufacturing villages. For 40 m. its course is followed by the Housatonic railway.

HOUSE, in point of law, is an Englishman's castle, though not a Scotchman's. In other words, when a man shuts himself up in his own house, no bailiff can break open the door to arrest him, or seize his goods for debt in England or Ireland, and no court can give a bailiff such power; in Scotland, however, even a man's own house is no protection, for leave can be got from the court, often called on that account the queen's keys, which enables the messenger to break open the outer door and arrest. In England, therefore, if a person can manage to procure supplies from without, he can fortify himself against the enemy for any length of time; but though it is not competent for the bailiff to break open the outer door by force, yet every trick or stratagem is fair in order to effect a peaceable entry, and once in he cannot be turned out. Where the party is charged with a criminal offense, a constable armed with a warrant, or in some cases without, is entitled to break into the house and arrest him, both in England and Scotland. A man is entitled also to defend his house against trespassers and thieves, using no greater force than is necessary; and, if necessary in that sense, he may even kill the intruder, though very strong circumstances are required to justify this. He may also put spring-guns on the premises. In Scotland a peculiar name is given to the offense of feloniously assaulting a man in his own house, called haimsucken (q.v.), a name also used in the old law of England; and all offenses committed in a house are generally punished more severely. *Housebreaking* is a technical name in Scotland, but in England is a popular phrase, the legal terms being larceny or robbery in a dwelling-house, or burglary, according to the circumstances.

HOUSEBOTE, in English law, the right which a tenant has to cut wood on the land to repair the house, often called *estovers.*

HOUSEBREAKING. See HOUSE.

HOUSEBURNING, a crime in Scotland, generally called arson in England.

HOUSE OF COMMONS. See PARLIAMENT.

HOUSE OF CORRECTION, a jail which is not under the ordinary charge of the sheriff, but is governed by a keeper; it is also sometimes called a bridewell. These houses were originally intended for the detention of vagrants and convicted persons, and compelling these to work; but their purpose is now extended in England, and the distinction between jail and house of correction abolished. The persons who may be committed to them are prisoners convicted of felony or misdemeanor, persons committed on charge or suspicion of felony or of misdemeanor, and vagrants. And any justice may commit to the house of correction persons awaiting their trial and persons convicted of small offenses. The prisoners are classified, and the regulations are mainly defined by the prison act of 28 and 29 Vict. c. 126. In Scotland the regulation of prisons is trans-

ferred to a board of directors of prisons, 23 and 24 Vict. c. 105, 28 and 29 Vict. c. 84, 34 and 35 Vict. c. 112.

HOUSE-DOVES, in the law of England, are protected like domesticated animals, and the taking of them is in general larceny; and if the offense of larceny cannot be made out, then a magistrate may inflict a penalty of £2 over and above the value of the bird (24 and 25 Vict. c. 96, s. 23). In Scotland it is also a theft to break into dove-cotes. But there is no summary redress for the lesser offenses.

HOUSE-FLY, *Musca domestica*, an insect too well known to need description, and remarkable for its extensive distribution both in the old and in the new world. It belongs to the vast dipterous family *muscides*. The maggots live in moist dung, in heaps of rotting vegetables, etc. When house-flies become annoying, various expedients are resorted to for killing them, as trapping in glasses partially filled with some sweet viscid fluid, or by pieces of paper covered with a mixture of sweet and poisonous substances. Sweet substances, however, attract flies into a room, so that the benefit of fly-traps is often doubtful; and care must be taken that the poisons used do not endanger the lives of children or others. Quassia is safe enough in this respect, and very fatal to flies.

In addition to what has been said in the article DIPTERA concerning the power which many insects possess of walking on perpendicular walls, ceilings, etc., it may here be mentioned that, according to the observations of Mr. Hepworth, who has carefully investigated this subject, although the membranous disks (*pulvilli*) on the foot of a fly are incapable of being used as suckers, yet the hairs with which they are thickly beset are terminated by minute disks, which probably are so used. At the same time, these minute disks appear to exude a liquid, not viscid, which probably serves to make the adhesion more perfect.

The proboscis of the house-fly is a very interesting microscopic object. It is chiefly formed by an extraordinary development of *tonguelet* or *ligula*, the upper part of the under-lip (*labium*), but with this are combined lancets formed of the metamorphosed *maxillæ*. (For these, see COLEOPTERA.) The lobes of the ligula are much enlarged and fleshy. They are surrounded by rough hairs, to aid in scraping or tearing delicate surfaces. There are many rows of these hairs on each lobe. In using its proboscis to feed on dry substances, as sugar, the fly moistens them with a liquid which may be regarded as saliva, so as to fit them for suctorial action. To aid in this suctorial action, the muscles of the lobes of the ligula are disposed in a spiral form.

HOUSEHOLD, ROYAL (of Great Britain), the personal attendants upon the reigning sovereign. The establishment was first regulated during the reign of Edward IV. (1461–83), who defined the offices and duties of its members. In the *Household Book* compiled by his orders regulations were made for the table of the king, the daily allowance of provisions, the amount of fuel and lights due to peers of each rank in attendance at court, and all officers and servants on ordinary and festive occasions; gifts, arms, wages, and liveries were also regulated from the highest to the lowest. Subsequent rulers improved upon these regulations. Henry VIII. found it necessary to exclude vagabonds, rascals, and boys from his household. But no definite rules were laid down until 1780, when Burke introduced a plan for radical reform. The expenses were almost beyond belief. Richard II. was always attended by a guard of 200 men, and had also in his retinue 13 bishops, besides barons, knights, and esquires. The household of Edward IV. cost £13,000 a year; that of William and Mary, £15,000. Since the accession of William III., parliament has fixed the amount of appropriation at the beginning of each reign. To the present queen the allowance is £385,000, distributed as follows: privy purse, £60,000; household salaries and retired allowances, £131,260; household expenses, £172,500; royal bounty, alms, and special services, £13,200: leaving an unappropriated balance of £8,040 to be used at discretion. But these sums throw little light upon the comparative grants for the sovereign's household and personal expenses. The lord-steward is the chief officer of the household, and under him are the treasurer, controller, paymaster, almoner, and a number of clerks. The steward has a salary of £2,000 a year. His authority extends over the offices of treasurer, controller, and master of the household, the first two of whom act as his deputies, and all the household officers and servants are subject to his authority except those of the chapel, the chamber, and the stable. The lord-chamberlain is the head of the second division of household officers. A third branch of the household is under the direction of the master of the horse, and embraces the master of the hounds, the grand falconer, the crown equerry, other equerries, and pages of honor. The ladies of the household fill a more important rank in the court of a female sovereign. The mistress of the robes is the head of this department, and under her are the ladies of the bedchamber, the maids of honor, and a great number in subordinate places. The office of mistress of the robes is of ancient and high dignity. She has the superintendence of all duties belonging to the bedchamber, within which the lord-chamberlain has no authority, regulates the rotation and the times of attendance of all the ladies, has the custody of the robes, and on state occasions it is her duty to see that the ceremony of robing the queen is properly performed. She rides in the same carriage with the queen on state occasions. The ladies of the

bedchamber are the personal attendants of the queen, and form part of her court. The bedchamber women are subordinate to them. The maids of honor are the immediate attendants of the queen, and accompany her on all occasions. There are other officers attached to the royal household: the dean and subdean of the chapel, with their clerks and chaplains; and, in the medical service, the physicians in ordinary and extraordinary, and surgeons, apothecaries, oculists, dentists, druggists, and chemists. These various officers comprise the queen's household; but in addition to these there are establishments for the prince of Wales and for other members of the royal family. The annuities of the whole family are as follows: the queen, £385,000; prince of Wales, £40,000; princess of Wales, £10,000; crown-prince of Prussia, £8,000; duke of Edinburgh, £25,000; princess Christian of Sleswick-Holstein, £6,000; princess Louise (Marchioness of Lorne), £6,000; duke of Connaught, £25,000; prince Leopold, £15,000; duchess of Cambridge, £6,000; duchess of Mecklenburg-Strelitz, £3,000; duke of Cambridge, £12,000: duchess of Teck, £5,000.

HOUSEHOLD GODS, deities supposed among the Romans to preside over their houses, and called *penates*. Among these were Jupiter and Juno. Some of the penates were called lares, regarded as the genii of the family; one of these was Vesta, the guardian of domestic unity.

HOUSEHOLD SUFFRAGE, in English law a necessary qualification for a voter is that he shall be a householder or housekeeper. Male citizens of proper age who have been for 12 months occupiers of a distinct dwelling or part of a dwelling, and have paid assessed rates, are entitled to vote. The suffrage extends also to lodgers occupying uninterruptedly for a similar period, presuming that such lodgings let unfurnished would bring £10 a year.

HOUSEHOLD TROOPS are those troops whose especial duty it is to attend the sovereign, and to guard the metropolis. These forces comprise three regiments of cavalry—the 1st and 2d life-guards, and the royal horse-guards, and three regiments of foot-guards (which include seven battalions), the Grenadier, Coldstream, and Scots Fusilier guards. The cost of these corps, for pay and allowances only, reaches the sum of £230,000 a year; and they number in all ranks 1302 cavalry and 5,950 infantry, who are justly held to be the flower of the British army.

HOUSE-LEEK, *Sempervivum*, a genus of plants of the natural order *crassulaceæ*, having a calyx of 6 to 20 sepals, the petals equal in number to the sepals, and inserted into the base of the calyx; the leaves generally very succulent, and forming close rosettes. The COMMON HOUSE-LEEK, or CYPHEL (*S. tectorum*), called *jous* or *jouds* in Scotland, and in some countries *Jupiter's beard*, grows wild on the rocks of the Alps, but has long been common in almost every part of Europe, planted on walls, roofs of cottages, etc. It sends up leafy flowering stems of 6 to 12 inches in height, bearing branches of pale-red star-like flowers, equally curious and beautiful. The leaves cut or bruised, and applied to burns, afford immediate relief; as they do also in stings of bees or wasps; and they are a beneficial application to ulcers and inflamed sores. They were formerly in high esteem as a remedy for fevers and other diseases, and an edict of Charlemagne contributed greatly to the extensive distribution of the plant. The edict is in these words: *Et habeat quisque supra domum suam Jovis barbam* (and let everybody have the Jupiter's beard on his house).—Other species possess similar properties. *S. soboliferum*, with yellowish-green flowers, is very frequently planted on walls in Germany. Some of the species, natives of the s. of Europe, Canary isles, etc., are shrubby; others are common green-house plants.

HOUSE OF LORDS. See PARLIAMENT.

HOUSEMAID'S KNEE is the term commonly applied to an acute inflammation of the bursa or sac that intervenes between the patella, or knee-pan and the skin. Housemaids are especially liable to it from their kneeling on hard damp stones. It causes considerable pain, swelling, and febrile disturbance. The only disease for which it can be mistaken is acute inflammation of the synovial membrane lining the cavity of the joint; but in this disease, the patella is thrown forwards, and the swelling is at the sides, while in housemaid's knee, the swelling is very superficial, and is in front of the patella.

The treatment consists essentially in the means usually employed to combat inflammation; viz., rest, leeches, fomentations, and purgatives; if suppuration take place, the sac must be freely opened, and the pus evacuated.

HOUSE-RENTS, in Scotland, when the lease is verbal, prescribe in three years—i.e., no action can be maintained after that time; but in England an action can be brought within six years. See LANDLORD AND TENANT.

HOUS'SA, or, according to Dr. Barth, HÁUSA, a district of Africa, in Sudan, forming a portion of the empire of Sókoto (q.v.). The name, however, is used to designate rather the race inhabiting the district, and the language which there prevails, than to mark any distinct political division. Houssa proper comprises seven states. The country of the Houssa is very beautiful, and the inhabitants lively, spirited, and industrious. See Barth's *Travels and Discoveries in North and Central Africa.*

HOUSSAYE, ARSÈNE, b. France, 1815, a poet and art critic. When only 15 years of age he joined the French army which was then besieging Antwerp. For the next three or four years he lived in Paris in extreme poverty, but in 1836 he appeared as an author in *Couronne de Bluets*, a novel. Becoming connected with the *Revue de Paris*, he commenced the publication of his *Men and Women of the Eighteenth Century* in that serial and afterwards republished it in two volumes; and in 1846 he published his *History of Dutch and Flemish Painting*. On the accession of Louis Napoleon, Houssaye was appointed to the direction of the theater Français and continued in that office till 1856. Among his works are *L'Histoire du Quarante-et-unième Fauteuil de l'Academie Français*, a series under the title *Parisiennes*, and many novels. He was decorated with the cross of the legion of honor in 1846, and made grand officer in 1858.

HOUSTON, a co. in s.w. Georgia, w. of the Ocmulgee river, intersected by the South-western railroad; 875 sq.m.; pop. '70, 20,406—15,332 colored. It has an undulating surface and much of it is still woodland. The chief productions are cotton, corn, and pork. Co. seat, Perry.

HOUSTON, the extreme s.e. co. of Minnesota on the Iowa border, traversed by the Southern Minnesota railroad, and bounded e. by the Mississippi; 575 sq.m.; pop. '75, 16,566. The surface is undulating and largely covered with forests; soil fertile; chief productions: wheat, corn, oats, and hay. Co. seat, Caledonia.

HOUSTON, a co. in n.w. Tennessee on the Cumberland and Tennessee rivers, crossed by the Louisville and Great Southern railroad; 350 sq.m.; organized since the census of 1870. Surface is hilly; main productions: corn and tobacco. Co. seat, Erin.

HOUSTON, a co. in e. Texas between Trinity and Neches rivers, intersected by the International and Great Northern railroad; 1090 sq.m.; pop. '70, 8,147—3,542 colored. It has a hilly surface largely covered with forests. Cotton and corn are the staple products. Co. seat, Crockett.

HOUSTON, a city in Texas, United States of America, at the head of steam-boat navigation on Buffalo bayou, 45 m. from its mouth in Galveston bay, and 80 m. from Galveston. It has iron foundries, machine-shops, and cotton-presses, and exports cotton, cattle, and agricultural products. Pop. '70, 9,382.

HOUSTON, a city, the seat of justice of Harris co., Texas; the great railroad center of the state, 46 m. n.w. of Galveston; pop. '70, 9,382; in '80, 16,750. There is steam-boat communication with Galveston. The city has more than a dozen churches, a convent, an academy, six banks, two cotton factories, machine-shops, planing-mills, etc. It is a great shipping place for cotton.

HOUSTON, SAM, gen. and ex-president of Texas, was b. near Lexington, Rockbridge co., Va., Mar. 2, 1793; enlisted as a common soldier in the war of 1812; was chosen ensign, and fought under Jackson with a courage that won his lasting friendship. In 1823 he was chosen member of congress, and in 1827 governor of Tennessee. In Jan., 1829, he married the daughter of an ex-governor; and in the following April, for reasons never made public, abandoned wife, country, and civilization, was adopted as a son by the chief of the Cherokee nation, beyond the Mississippi, and was formally admitted as a chief. In 1832 he went to Washington and procured the removal of several United States Indian agents, on charges of fraud, but got into personal difficulties with their friends. The Texan war offered a new field to his ambition. Houston was made commander-in-chief. The Americans at first sustained some severe defeats, and Houston was obliged to retreat before the Mexicans under Santa-Anna for nearly 300 m., but suddenly turning on his pursuers, Houston fought the remarkable and decisive battle of San Jacinto, April 21, 1836, at one blow annihilated the Mexican army, and achieved the independence of Texas. The hero of San Jacinto was elected first president of Texas, and re-elected in 1841, and on the annexation of Texas to the United States, in 1845, was sent to congress. In 1859 he was elected governor of Texas. He opposed secession, but retired to private life when opposition was fruitless. He died in 1862.

HOUSTON, SAM (*ante*). Although Houston achieved his public reputation mainly through his connection with the history of Texas, yet his life, prior to his settlement in that country, was filled with most romantic incidents, tending to illustrate the strong, original character of the man, and his devotion to his country, and to principles of integrity, as a man and as a citizen. From the time when he commenced the study of law in Nashville (about 1814) to the year 1827, when he was elected governor of Tennessee, he was in a remarkable degree the subject of political preferment. He rose from office to office, being made a member of congress in 1823, when only thirty years of age, and was already esteemed as one whose future promised the highest honors. In 1828 Houston was married to an estimable and beautiful young lady, and surprised the country by leaving her on the day following that of the ceremony, resigning his office of governor of the state, and retiring to the wilds of Arkansas to enable his wife to procure a divorce on the ground of desertion. The secret of this strange action was only made known in the present year (1880), when it was learned from an authentic source that Houston had discovered a prior attachment on the part of his wife, who would appear to have been coerced into her marriage with him, and that, with the natural nobility of his nature, he had willingly sacrificed himself, his social ties, and his political aspir-

ations, to the end that the woman he loved might be made happy. His bride procured the divorce necessary, and some time after married the man of her choice. Houston's conduct was commented upon in terms the most severe, and stories to his disadvantage were freely circulated and generally believed. In the meantime he had made his residence in the Cherokee country, and a year later was the representative of the tribe at Washington. His connection with Texas affairs occurred through a casual visit a year or two after this period, and he was the delegate of the 20,000 Americans—the outgrowth of the Connecticut colony in Texas—to the convention for revision of the Mexican constitution. Houston resisted secession from its inception, and it is an interesting incident in his life, and in the history of his country, that of his riding close beside the carriage in which sat Lincoln and Buchanan, on the day of the inauguration of the former, guarding the president-elect from the possibility of assassination—which was even then threatened, as it was afterwards consummated. The picture of this stalwart old man, nearly three score and ten, armed and watchful, guarding the person of Abraham Lincoln, is one that deserves to be perpetuated in American history.

HOVELERS. See DEAL BOATMEN.

HO'VEN, or distention of the rumen or first stomach with gas, is a common complaint among cattle and sheep, and results from the eating of food to which the animal has been unaccustomed, from wet clover or vetches, or from any easily fermentable food. Relief generally follows walking exercise, friction on the belly, and a dose of any ordinary stimulant, which for a cow may consist of a couple of ounces of turpentine, whisky, ether, or ginger, to which should also be added, in order to clear the bowels of the offending food, a laxative, such as a pint of oil or a pound of salts. A fourth or fifth of these quantities will suffice for sheep. The introduction of the probang, with the small end downwards, allows the escape of gas when there is little food in the stomach. If simple remedies fail, the breathing becomes distressed, and the animal stupid; the gas may with safety be allowed to escape by an external opening made at a point intermediate between the last rib, the lumbar vertebræ, and the prominence of the haunch, either with a canula and trochar, or a large pocket or table knife. For several days after an attack of hoven, the digestive organs are apt to be easily deranged, and the animal must have soft and digestible food, and an occasional dose of simple laxative medicine.

HOVEY, ALVAH, b. Vt. 1820; graduated at Dartmouth; studied theology, and became pastor of a Baptist church in Maine. In 1850 he was a teacher in the Newton theological institution; in 1853, professor of theology and Christian ethics. He has published *Life of Chrysostom; The State of the Impenitent Dead; The Scriptural Law of Divorce; Religion and the State,* and other works.

HOVEY, ALVIN P., b. Ind. 1821; brought up to the study and practice of law. He served in the war of the rebellion as an officer of volunteers, and rose to brevet maj. gen. In 1866 he was appointed U. S. minister to Peru.

HOWARD, a co. in s.w. Arkansas, drained by a branch of Little river; formed after 1870. It has a generally level surface and fertile soil. Co. seat, Center Point.

HOWARD, a co. in n.w. Dakotah, on the Montana border, bounded on the n. by the Missouri and intersected by Little Missouri river. Area 3,500. Population not ascertained.

HOWARD, a co. in central Indiana, traversed by the Pittsburg, Cincinnati, and St. Louis, and the Indianapolis, Peru, and Chicago railroads; 300 sq.m.; pop. '70, 15,847. It has a level surface, much of it covered with forests, and the soil is fertile. Chief productions: wheat, corn, and pork. Co. seat, Kokomo.

HOWARD, a co. in n. Iowa, on the border of Minnesota, drained by the Upper Iowa river, and intersected by the Milwaukee and St. Paul railroad; 430 sq.m.; pop. '80, 10,837. It has a surface divided into prairie and woodland, and the soil is fertile. The main products are wheat, corn, and oats. Co. seat, Cresco.

HOWARD, a co. in Kansas, bounded on the s. by Indian territory; drained by Fall river and Suicide creek; 1271 sq.m.; pop. '70, 2,794. The soil is fertile, producing wheat, corn, etc. Co. seat, Elk Falls.

HOWARD, a co. in central Maryland, on Patapsco and Patuxent rivers, and the Baltimore and Ohio railroad; 275 sq.m.; pop. '70, 14,150–3,474 colored. The surface is hilly, and the soil fertile; productions: corn, wheat, oats, pork, etc. Co. seat, Ellicott City.

HOWARD, a co. in n. central Missouri, on the Chariton and Missouri rivers, crossed by the Missouri, Kansas, and Texas railroad; 470 sq.m.; pop. '80, 18,428–5,233 colored. The surface is undulating, and the soil is fertile; chief productions: corn, wheat, and tobacco. Co. seat, Fayette.

HOWARD, a co. in e. central Nebraska, on tributaries of Platte river; pop '76, 1680. The surface is mostly prairie. Co. seat, St. Paul.

HOWARD, a co. in n.w. Texas, situated on one of the forks of the Colorado; 900 sq.miles. There are no permanent white settlers at present.

HOWARD. The noble house of Howard has stood for many centuries at the head of the English nobility. The Howards have enjoyed the dukedom of Norfolk since the middle of the 15th c., and have contributed to the annals of the nation several persons of the most distinguished character both in politics and in literature. Neither sir W. Dugdale, nor Collins, nor sir Bernard Burke claims for the Howards any more ancient origin than sir William Howard, a learned chief-justice of the common pleas under Edward I. and Edward II., though Dugdale incidentally mentions a tradition that their name is of Saxon origin, and derived either from an eminent office under the crown before the conquest, or from Hereward, the leader of those forces which for a time defended the isle of Ely so valiantly against William the conqueror. Be this as it may, it is certain that sir John Howard, the grandson of the above-mentioned judge, was not only admiral and captain of the king's navy in the n. of England, but sheriff of Norfolk, in which county he held extensive property, which was subsequently increased by the marriage of his grandson, sir Robert, with the co-heiress of the ancient and noble house of Mowbray, dukes of Norfolk. The only son of this union was sir John Howard, one of the leading supporters of the house of York, who, having gained early distinction in the French wars of Henry VI., was constituted by Edward IV. constable of the important castle of Norwich, and sheriff of Norfolk and Suffolk. He subsequently became treasurer of the royal household, obtained "a grant of the whole benefit that should accrue to the king by coinage of money in the city and tower of London, and elsewhere in England;" and further, was raised to the peerage as lord Howard and duke of Norfolk. We find him in 1470 made capt.gen. of the king's forces at sea, and he was most strenuous in that capacity in his resistance to the house of Lancaster. Finally, he was created earl marshal of England, an honorary distinction still borne by his descendants, and in 1484 was constituted lord admiral of England, Ireland, and Aquitaine. He fell next year, however, on Bosworth Field, and, after his death, his honors were attainted, as also were those of his son Thomas, who had been created earl of Surrey. The latter, however, after suffering three years of imprisonment in the tower of London, obtained a reversal of his own and his father's attainders, and being restored to his honors accordingly, became distinguished as a general, and is more particularly celebrated in history for his defeat of the Scotch at Flodden in 1513. His son Thomas, third duke of Norfolk, was attainted by Henry VIII., though afterwards restored in blood, and by his marriage with a daughter of king Edward IV., became the father of the ill-fated and accomplished earl of Surrey, whose execution was the last of the many acts of tyranny which disgrace the memory of Henry VIII. Eminent as a statesman, a warrior, and a poet, Surrey is thus described by sir Egerton Brydges: "Excellent in arts and in arms; a man of learning, a genius, and a hero; of a generous temper and a refined mind, he united all the gallantry and unbroken spirit of a rude age with all the elegance and grace of a polished era. With the greatest splendor of descent, in possession of the highest honors and unbounded wealth, he relaxed not his efforts to deserve distinction by his personal worth. Conspicuous in the rough exercises of tilts and of tournaments, and commanding armies with skill and bravery in expeditions against the Scots under his father, he still found time, at a period when our literature was rude and barbarous, to cultivate his mind with all the exquisite spirit of the choicest models of Greece and Rome, to catch the excellences of the revived muses of Italy, and to produce in his own language compositions which, in simplicity, perspicuity, graceful ornament, and just and natural thought, exhibit a shining contrast to the works of his predecessors, and an example which his successors long attempted in vain to follow."

The earl of Surrey was executed during the lifetime of his father, on whom the same sentence had been passed, when the death of the royal tyrant saved him from the block. His grandson, Thomas, fourth duke of Norfolk, in like manner suffered attainder, and was executed on Tower hill for high treason, for his communication with Mary queen of Scots. The family honors, however, were again restored, partly by James I., to his grandson, and partly by Charles II., to his great-great-grandson, Thomas, who thus became eighth duke, and whose cousin and successor, Charles, ninth duke, was the direct ancestor of the present duke of Norfolk.

It would be impossible here to give a list of all the honors which from time to time have been conferred on various branches of the ducal house of Howard; it is sufficient to say, that in one or other of their widespread branches, the Howards either have enjoyed within the last three centuries, or still enjoy, the earldoms of Carlisle, Suffolk, Berkshire, Northampton, Arundel, Wicklow, Norwich, and Effingham, and the baronies of Bindon, Howard de Walden, Howard of Castle Rising, and Howard of Effingham.

It will be seen from the above remarks that the ducal house of Norfolk is one whose fate it has been, beyond all others among the English nobility, to find its name interwoven with the thread of English history, and not rarely in colors of blood. The accomplished but unfortunate Surrey, and his scarcely less unhappy father, Thomas Howard—whose head was only saved from the block on which his son so nobly suffered by the death of the eighth Henry—are "household words" in the pages of English history; and readers of Shakespeare will have other recollections of the same name allied with other historical events; while those who are familiar with the writings of Pope,

will not have forgotten how tersely and pointedly he typifies the glory of ancestral pedigrees by

All the blood of all the Howards.

Other members of the house of Howard have gained a place in the pages of English history. Sir Edward Howard K.G., brother of the first earl of Surrey, was made by Henry VIII. the king's standard-bearer and admiral of the fleet, in which capacity he lost his life in boarding a French vessel off Brest in action in 1513; his brother, sir Edmund, acted as marshal of the horse at Flodden; and his half-brother, sir Thomas Howard, was attainted, and died a prisoner in the tower, for aspiring to the hand of the lady Margaret Douglas, daughter of Margaret, queen of Scotland, and niece of Henry VIII., one of whose ill-fated consorts was the lady Catharine Howard.

HOWARD, CATHARINE, 1520–42; fifth wife of Henry VIII. She was a daughter of Edmund Howard, third son of the duke of Norfolk. The king married her soon after the divorce of Anne of Cleves, in 1540. She was accused of adultery, and after a trial, in which her guilt seems to have been established beyond doubt, she was executed Feb. 13, 1542.

HOWARD, CHARLES, Lord Howard of Effingham, 1536–1624; b. England, son of lord William Howard, then lord high admiral, under whom he served with distinction. He succeeded his father in command just before the appearance of the Spanish armada, and it was mainly owing to his valor that the formidable enemy was defeated. In 1595 he commanded the expedition against Cadiz. In 1599, when England was again threatened by Spain, and Essex in Ireland appeared to encourage disaffection, Howard was made lieut.gen. of the kingdom, with full command of the army and navy. A few years later he resigned his office in favor of Villiers, duke of Buckingham.

HOWARD, JACOB MERRITT, LL.D., 1805–71; b. Vt., graduated at Williams college in 1830. He was for some time a teacher in an academy in Massachusetts. In 1833 he was admitted to the bar in Michigan, where he had settled. Five years later he was chosen to the legislature; in 1841 was a member of congress; and U.S. senator from 1862 to 1871. He is credited with having originated the name of the republican party, and is said to have written its first platform.

HOWARD, JOHN, "the philanthropist," was born at Hackney, near London, about 1726. From his father, who had been engaged in trade, Howard inherited a considerable fortune. In 1756, the year of the great earthquake at Lisbon, urged by motives of benevolence, as well as of curiosity, he set sail for that city. On this voyage his vessel was taken by a French privateer, and he was carried into the interior, when he suffered imprisonment for some time. The hardships which he here underwent, combined with the knowledge of prisons and the miseries of prison-life which he acquired as a county sheriff in 1773 and afterwards, determined him in devoting himself to prison reform. His life hereafter is but a chronicle of his journeys throughout the United Kingdom and the continent, in which he visited the principal prisons and hospitals. His chief work is *An Account of the Lazarettos in Europe, etc., with Remarks on the present State of the Prisons in Great Britain and Ireland* (1789). He died Jan. 20, 1790, at Kherson, in the s. of Russia, from having caught infection from a fevered patient for whom he had prescribed. The fame of Howard is peculiar. He is remembered not so much for his talents as for that devotion to his suffering fellow-men, in which he expended his fortune and his life.

HOWARD, JOHN EAGER, 1752–1827; b. Md.; a soldier in the war of the revolution, and commanded a regiment at Germantown, where he did gallant service. At the battle of the Cowpens he saved the fortunes of the day by a brilliant bayonet charge, said to have been the first effective use of the bayonet by the patriots. He was voted a medal by congress for this service. He was severely wounded at Eutaw, and gained distinction in other battles. After the return of peace he was a member of congress, governor of Maryland, and U. S. senator. When war with France was imminent Washington appointed him a brig.gen.

HOWARD, OLIVER OTIS, LL.D., b. Me., 1830; graduated at Bowdoin college in 1850, and at West Point in 1854, and entering the army was first engaged in field duty in the Florida Indian war. He returned to the academy, and was for a time assistant-professor of mathematics. In June, 1861, he was made col. of volunteers, and commanded a brigade at the battle of Bull Run. In the same year he rose to brig.gen.; continued in active service in the Virginia campaign, and lost an arm at the battle of Fair Oaks. In Nov., 1862, he was made maj.gen. of volunteers, and at Chancellorsville and Gettysburg commanded the second army corps. In 1863 he was in Tennessee, and participated in the battles of Lookout Mountain and Missionary Ridge. In 1864, he commanded the fourth corps in the army of the Cumberland, and in July was concerned in the engagements at Dalton, Resaca, and Kenesaw Mountain; he assisted in the siege of Atlanta, and in further operations under Sherman in the march to the sea. After the close of the war he was detailed to serve as commissioner of the Freedman's Bureau, and held that office until June, 1872. He was afterwards a special commissioner of Indian affairs, and from 1869 to 1873 president of Howard university. Since 1873 he has served on the Indian frontier. In Dec., 1868, he was

made a brig.gen. in the regular army, and the next year brevet maj.gen. In 1881, by appointment of the president, he took command at West Point, including the military academy, relieving maj.gen. Schofield.

HOWARD UNIVERSITY, in Washington, D.C., was organized by act of congress in 1867, and named from gen. O. O. Howard, one of its most conspicuous founders, and its first president. It is intended for the higher education of negro students, but its laws make no formal distinction, in regard to color or sex, as to teachers or scholars. The university buildings are beautifully situated on very high ground 2 m. from the business center of the city, facing the university park. The principal building is of gray brick and is four stories high, containing recitation and lecture rooms, chapel, library, philosophical rooms, museum, and offices. The medical building is on the s. side of the park. Miner hall, set apart for ladies, will accommodate 140 students, and has rooms in connection with it for matron and teachers. Clark hall, for young men, accommodates 200 students. The general library contains about 7,000 volumes, many of them choice and select works. The professional departments have separate libraries. The mineral cabinet contains over 4,000 specimens, including fossils, minerals, etc. The museum contains a collection of coins, medals, and curiosities, specimens of valuable woods, Indian relics, portraits of distinguished men and women, views of the late war, engravings, and photographic views of classic ruins in Rome. The medical department has 7 professors and 3 lecturers; the theological department 3 professors and 1 lecturer; the classical, preparatory, and normal departments have 2 professors and 3 teachers; the law department 3 professors, and the collegiate department 3. The number of students in 1880 was 250. A majority of the medical students are white. The theological department is under the joint supervision of the presbytery of Washington and of the American missionary association (Congregational). The general management of the institution is vested in a board of 21 trustees. It has an income of $8,500 per annum from interest and rent of buildings, and in 1880 was aided by congress to the amount of $10,000. President, Rev. Wm. W. Patton, D.D.

HOWE, EARL (RICHARD HOWE), British admiral, was the second son of Emanuel Scrope, second viscount Howe of the Irish Peerage. He was born in 1725, and educated at Eton. Having a boyish passion for the sea, he left Eton at 14, and went to the south seas in the squadron under Anson. He was with admiral Vernon in 1745, and at the time of the Scottish rebellion, being in command of the *Baltimore* sloop, took part in the siege of fort William. He also, with another vessel, beat off two French ships conveying troops and ammunition to the pretender, for which he was made post-captain. In 1755 his ship, the *Dunkirk*, captured the *Alcide*, a French 64, off Newfoundland. He next served under sir E. Hawke in the expedition against Rochefort. He was ordered to attack the fort on the isle of Aix with his ship the *Magnanime*, compelled it to surrender after an hour's cannonade, and achieved the only material success which attended the expedition. He was commodore of the squadron which sailed in 1758 for St. Malo. The troops were landed and re-embarked without loss, after destroying all the magazines and shipping in the port to the number of 120 sail. In the same year he took Cherbourg. Nearly 200 pieces of iron cannon and mortars were here rendered unserviceable; the brass cannon were brought to England; the celebrated basin was destroyed, and 27 ships and vessels were burned or sunk. A second attack upon St. Malo was less successful. The French troops assembled in force at the bay of St. Cas, and it was only by the intrepidity of Howe, who went in his own barge into the center of the enemy's fire, that the re-embarkation of the rear-guard was effected, with great loss of life. In 1758 he succeeded to the Irish title of viscount, on the death of his brother, the brig.gen., who was killed before Ticonderoga. He took part in the defeat of the fleet under the marquis de Conflans, and captured the *Hero*, 74 guns. In 1760 he was made col. of the Chatham division of marines, and afterwards a lord of the admiralty, and treasurer of the navy. In 1776 he commanded a fleet on the American coast, when the conquest of New York, Rhode Island, Philadelphia, and every settlement within the reach of a naval force, testified to his skill and energy. In 1778 he defended the American coast against a superior naval force under D'Estaing. He was made a viscount of Great Britain in 1782, and sent out with a fleet to relieve Gibraltar. He succeeded in disembarking troops, ammunition, and supplies, and then offered battle to the combined fleets of France and Spain, which declined an engagement. He was made first lord of the admiralty in 1783, and received an English earldom in 1788. When war with France broke out in 1793 he took the command of the channel fleet, and next year gained the victory which will long be known as that of "the glorious first of June." The French fleet consisted of 26 ships of the line, and the English of 25. Howe in his flag-ship, the *Queen Charlotte*, engaged in the Bay of Biscay, off Ushant, the French admiral, who in less than an hour crowded all the sail he could carry, followed by as many of his ships as could get away. The English captured two ships of 80 guns, and four 74's; another 74 sank immediately after she was taken possession of. London was illuminated three nights in honor of the victory. The thanks of parliament were voted to Howe. George III. visited him on board the *Queen Charlotte*, gave him a sword, and made him a knight of the garter. His last service was in bringing back the mutinous seamen at Portsmouth to their duty in 1797. He died August 5, 1799, aged 74, leaving a name high in the roll of English naval worthies.

HOWE, ELIAS, 1819-67; b. Mass.; brought up as a farmer and a miller, received his education in the common schools. In Lowell he first found employment in a manufactory of cotton machinery, and in Boston worked in an ordinary machine shop. Here he conceived the idea of the sewing-machine, which he perfected in May, 1845, and patented Sept. 16, 1846. It was not well received by the public, and the following year he went to England, where he was equally unsuccessful. After an absence of two years he returned in great poverty to find that others were profiting by his invention; but he continued working at the machine, devoting such means as he obtained to the prosecution of the people who had infringed upon his patent. His perseverance was at last crowned with success, and in 1854 his claim to priority of invention was legally established. Thenceforth his career was one of prosperity, and an income sometimes reaching nearly a quarter of a million of dollars per year repaid him for long effort and privation. Before the expiration of the patent in 1867 he had accumulated more than $2,000,000. In the war of the rebellion Howe served as a common soldier in a Connecticut company, and on one occasion when the pay of the regiment was delayed he advanced the money himself.

HOWE, GEORGE AUGUSTUS, 1724–58; b. England, and came to America in command of a British regiment in July, 1757, at the close of which year he was made brig.gen. In July, 1758, he was killed in a skirmish with the French at lake George. A monument in Westminster abbey, paid for by the colony of Massachusetts, has been erected in his honor.

HOWE, JOHN, who has been called the *Platonic Puritan*, was b. May 17, 1630, at Loughborough, in Leicestershire, to the living of which parish his father had been presented by Laud. He studied both at Cambridge and Oxford, and after preaching for some time at Winwick, in Lancashire, and Great Torrington, in Devonshire, he was appointed domestic chaplain to Cromwell in 1656, in which difficult situation his conduct was such as to win praise even from the enemies of his party. At the restoration he returned to Torrington, where the position he had held during the commonwealth made him an object of close suspicion to the government. The *Act of Uniformity*, however, ejected him from his parish, Aug. 24, 1662, and he wandered about preaching in secret till 1671, when he was invited by Lord Massarene, of Antrim castle, in Ireland, to become his domestic chaplain. Enjoying there the friendship of the bishop of that diocese, and liberty to preach in all the churches under his jurisdiction, he wrote his *Vanity of Man as Mortal*, and began his greatest work, *The Good Man the Living Temple of God* (1676–1702), which occupies one of the highest places in Puritan theology. In 1675 he was called to be pastor of the dissenting congregation in Silver street, London, and went thither in the beginning of 1676. In 1677 he published, at the request of Mr. Boyle, *The Reconcilableness of God's Prescience of the Sins of Men with the Wisdom of His Counsels and Exhortations;* in 1681, *Thoughtfulness for the Morrow;* in 1682, *Self-dedication;* in 1683, *Union among Protestants;* and in 1684, *The Redeemer's Tears wept over Lost Souls.* In 1685 he was invited by Lord Wharton to travel with him on the continent; and after visiting the principal cities, he resolved, owing to the state of England, to settle for a time at Utrecht, where he was admitted to several interviews with the prince of Orange. In 1687 the *Declaration for Liberty of Conscience* induced him to return to England, and at the revolution next year he headed the deputation of dissenting clergymen when they brought their address to the throne. Besides smaller works, he published, in 1693, *Carnality of Religious Contention;* in 1694–95, several treatises on the Trinity; in 1699, *The Redeemer's Dominion over the Invisible World;* and he continued writing till 1705, when he published *Patience in Expectation of Future Blessedness.* He died April 2, 1706.—See Henry Rogers's *Life and Character of John Howe, with an Analysis of his Writings.*

HOWE, JULIA WARD, b. N. Y., 1819; daughter of Samuel Ward, and widow of the late Dr. Samuel G. Howe, the Boston philanthropist, whom she married in 1843. Her education was the best afforded to girls of her time, and at an early age she gave evidence of superior literary ability and taste; and after her marriage to Dr. Howe she became warmly interested in moral, social, and political subjects. She was an early champion of the equal rights of women, and has written and spoken extensively, in Europe and the United States, in advocacy of woman suffrage. She has also labored extensively in the cause of peace at home and abroad, with a view to the formation of a public sentiment in favor of settling international disputes by arbitration. She has often spoken in the pulpit upon religious themes. In Europe she is one of the best-known women of America. Her principal works, in addition to two volumes of travel and observation and numerous papers in magazines and journals, are: *Passion Flowers; Later Lyrics; Words for the Hour;* and two dramas, *The World's Own* and *Hippolytus.* Her *Battle Hymn of the Republic* was sung by union soldiers at thousands of camp-fires, as well as by popular assemblies all over the north, during the war of the rebellion.

HOWE, SAMUEL GRIDLEY, M.D., an American physician, was b. at Boston, Nov. 10, 1801, and educated at the Boston Latin school and Brown university, where he graduated in 1821. He then studied medicine. Being an admirer of lord Byron, he wished to join him in aiding the Greek revolution, and embarked from Boston for Greece in 1824; volunteered as a surgeon; served two years as a guerrilla; organized the medical staff

of the Greek army, and was appointed its chief. The Greeks were suffering for supplies, and even for food; and he went to America and raised large contributions. Returning with food, clothing, and supplies, he formed the colony of Corinth, in which he filled all offices, from governor to constable. Taken down with the swamp-fever in 1830, he went to Paris, where he attended medical lectures, and in 1832 returned to the United States. Having become interested in the education of the blind, he was sent to Europe to examine the best institutions, but volunteered in the Polish insurrection, and spent six weeks in a Prussian prison. On his return, the Massachusetts institution for the blind was established and placed under his management. He also established a school for idiots, and in 1828 published a *Sketch of the Greek Revolution*. He revisited Greece in 1867, bearing supplies to the Cretans, then struggling for their independence. He died 1876.

HOWE, SIR WILLIAM, Viscount, 1729–1814; an English officer who served under Wolfe in the conflict on the heights of Abraham (Quebec), 1759. In the beginning of the American revolution he succeeded Gage as British commander-in-chief, and was in charge at the Bunker-hill fight. After the defeat of the Americans in the battle of Long Island and their retreat from New York, Howe took possession of the city, remaining there until succeeded by sir Henry Clinton, May, 1778. On the death of his brother Richard he succeeded to a baronetcy, and was a privy councilor at the time of his death.

HOWELL, a co. in s. Missouri, on the Arkansas border, drained by Spring river; 900 sq.m.; pop. '70, 4,218—24 colored. It has a hilly surface, and is to a large extent covered with forests. The soil is tolerably fertile. Chief productions: corn and pork. Co. seat, West Plains.

HOWELL, JOHN C., b. Philadelphia, 1819; entered the navy as a midshipman in 1836; rising to commander in 1862, and commodore in 1872. At the capture of fort Hatteras he was executive officer of the steam frigate *Minnesota*, and at fort Fisher he was in command of the *Nereus*. After the war he was placed in command of navy-yards, and in 1874 was appointed chief of the bureau of yards and docks.

HOWELLS, WILLIAM DEAN, b. Ohio, 1837; the son of a printer and himself brought up to that trade. He passed naturally to the editorial desk, and was a writer on the *Cincinnati Gazette* and the Columbus *State Journal*. In the mean time he became a contributor (chiefly of verse) to the *Atlantic Monthly*, and in unison with John J. Piatt he wrote *Poems of Two Friends*. President Lincoln sent Howells to Venice as consul, where he remained until the accession of Johnson to the executive chair. Soon after his return he became assistant editor of the *Atlantic Monthly*, and in 1871 was chosen sole editor, a position which he still retains. Some of his publications are *Venetian Life; Italian Journeys; No Love Lost; Suburban Sketches; Their Wedding Journey; A Chance Acquaintance;* and *The Undiscovered Country*.

HOWITT, WILLIAM and MARY, two English authors that may most properly be treated together. William Howitt was born in 1795 at Heanor, in Derbyshire, and was educated at various schools in connection with the society of Friends, to which persuasion his family belonged. In his youth he was fond of outdoor sports, and he celebrated in verse the scenery with which he was familiar. In 1823 he married Miss Mary Botham, a lady of literary taste and acquirements, and whose family, like his own, was attached to the principles of Quakerism. *The Forest Minstrel*, with their joint names on the title-page, was published during the year in which they were married. For three or four years thereafter they employed themselves in contributions to annuals and magazines, and in 1827 a selection from these fugitive pieces appeared under the title of *The Desolation of Eyam*. From this date till 1837 William Howitt wrote *The Book of the Seasons, Popular History of Priestcraft*, and *Tales of the Pantika*. During the same period Mary Howitt produced *The Seven Temptations* and a country novel entitled *Wood-Leighton*. In 1837 William and Mary Howitt removed to Esher, in Surrey, and at that place William Howitt wrote *Rural Life in England; Colonization and Christianity; Boy's Country Book;* and *Visits to Remarkable Places*, first series. Mary Howitt at the same time employed herself in writing *Tales for Children*, many of which are popular. In 1840 William Howitt, with his wife and family, removed to Heidelberg, where they resided two years. Mary Howitt made herself mistress of the northern languages, and translated the works of Miss Bremer and Hans C. Andersen. Meanwhile William Howitt wrote and translated novels; he also published *The Aristocracy of England* and *The Homes and Haunts of the British Poets*. In 1852 he went to Australia, where he remained two years. In the last years of his life, his wife and he (both become converts to spiritualism) lived in Italy. William died at Rome, Mar. 3, 1879. Among his later works are: *Law, Labor, and Gold, or Two Years in Victoria; The Ruined Abbeys of Great Britain; The Northern Heights of London; The Illustrated History of England*, 6 vols., completed in 1861; *History of the Supernatural in all Ages and Nations* (1863); *Discovery in Australia, Tasmania, and New Zealand* (1865); and *The Mad War Planet and other Poems* (1871).

HOWITZERS are guns which came into use early in the history of field-artillery, as portable instruments for discharging shell into a hostile force. As, for this purpose, no

great range was necessary, a small charge of powder sufficed; and the howitzer could be made, in proportion to its large bore, extremely light. It combines in some degree the accuracy of a cannon with the caliber of a mortar; and, while equally effective at short ranges, is far more portable than either. That the powder, on its expansion, may act with full force on the shell, it is confined in a hemispherical chamber of smaller diameter than the rest of the bore, the mouth of which is completely closed by the shell when rammed home. The Coehorn howitzer, much used in India for mountain service, is a small gun, light enough to be borne by a horse up hilly defiles, etc.

HOWLER, HOWLING MONKEY, or STENTOR (*mycetes*), *alouatte* of the French, a genus of American monkeys, remarkable for the dilatation of the hyoid (q.v.) bone into a hollow drum, which communicates with the larynx, makes a conspicuous external swelling of the throat, and gives prodigious power to the voice, enabling these animals to emit hideous sounds, which are heard miles away, and to which all their names refer. They live chiefly among the branches of trees, and take extraordinary leaps from one to another, taking hold by the tail as readily as by the hands, and often swinging by it alone. They are gregarious, and unite their voices in concert, so as to produce a most deafening noise. The monkeys of this genus are regarded as in their low intelligence and their fierceness of disposition American representatives of the baboons, whilst in many of their habits they more nearly accord with the gibbons of the old world. They inhabit the north-eastern parts of South America. They are the largest monkeys in the new world. There are not many species.

HOWSON, JOHN SAUL, D.D., b. England, 1816; graduated at Cambridge; in 1845 took holy orders, and afterwards became senior classical master in Liverpool college. From 1849 to 1865 he was principal of that college. In 1867 he became dean of Chester. He is best known from his *Life and Epistles of St. Paul*, written in conjunction with Rev. W. J. Conybeare. He has also written *The Character of St. Paul* and *The Metamorphoses of St. Paul.*

HOWTH, a small peninsula on the e. coast of Ireland, forms the n. shore of the bay of Dublin, and is 2½ m. long by about 2 m. broad, with an area of about 2,600 acres. Howth is connected with the mainland by a low and narrow isthmus, and its insular appearance greatly enhances the picturesque effect of Dublin bay.

HÖXTER, a t. in Westphalia, on the Weser, 30 m. by rail s.s.e. of Paderborn; pop. 5,041. It is a prosperous manufacturing town, paper, linen, and cotton goods being the chief productions.

HOY, a small vessel differing little, if at all, from the sloop or smack. Its ordinary employment is in carrying goods or passengers coastwise from one place to another, and particularly in inlets, etc., where longer lighters and other vessels could maneuver only with difficulty.

HOY, one of the Orkney islands, lies s.w. from Pomona, or mainland, from which it is separated by a passage about 2 m. in width. It is 14 m. long and 6 m. broad, and its population in 1871 was 1385. Unlike most of the islands of its group, Hoy rises abruptly from the sea, with precipitous cliffs 1000 ft. in height fronting the w.; the highest eminence, Wart hill, is 1555 ft. above sea-level. It has in the s. the harbor of Long Hope, said to be the finest in the Orkneys, and defended by a fort and two martello towers. Among the curiosities of the island are the Dwarfie stone, a block of sandstone, 22 ft. long, 17 ft. broad, and 7 ft. high. One end of it has been hollowed out by iron tools, the marks of which are still visible, and a kind of apartment formed. In the s.w. of the island is the Old Man of Hoy, a pillar of rock 300 ft. in height.

HO'YA, a genus of tropical plants of the order *asclepiadaceæ*, having a 5-cleft wheel-shaped corolla and a 5-leaved spreading fleshy corona. Some of the species are common in hothouses, and from the appearance of their flowers they are called *wax-plants.*

HOYLE, EDMUND, 1672–1769; b. England; a writer on card-playing, and afterwards on games in general. His first book was published about 1744, and has been by himself and others expounded and elaborated in almost innumerable editions down to the present time. He is a great authority upon whist, and reference to him has become proverbial. To be "according to Hoyle" is to be altogether right.

HUACA. See GUACA.

HUAHEI'NĒ, the most easterly of the Society islands (q.v.).

HUALLA'GA, a river of Peru, rises on the e. side of the Andes, near lat. 11° s., at an elevation of 13,200 ft. above the sea. After a northerly course of about 500 m., during which it presents many considerable falls, it enters the Amazon.

HUAMAN'GA (now called AYACUCHO), a city of Peru, in the department of Ayacucho, stands on an affluent of the Apurimac. It was founded by Pizarro in 1539, on the route between the old and new capitals of the country, Cuzco and Lima. It has a population of about 25,000, with a cathedral and a university. Near Huamanga, in 1824, was completed the independence of Spanish America, by the decisive victory of gen. Sucré.

HUANA'CA, or GUANACO, *Auchenia huanaca* (see AUCHENIA), a species of the same genus with the llama and alpaca, of both of which some naturalists suppose it to be the wild original. It is found not only on the Andes, but throughout great part of Patagonia. It is of a reddish-brown color, the ears and hind-legs gray. It generally lives in herds of 10 to 40, and is very quick-sighted and wary; although such is the strength of its curiosity that hunters attract the herds within easy reach of their rifles by lying down on the ground and kicking their feet in the air. Like its congeners, the huanaca is extremely sure-footed on rocky ground.

HUANCAVELI'CA, a department in the interior of Peru, s.e. of the department of Lima; 10,814 sq.m.; pop. '76, 104,140. It is a mountainous, cold, and unfruitful region. There is some gold and considerable silver and copper, but the main production is quicksilver from mines discovered in 1563. Among the exports are the wools of sheep and llamas.

HUANCAVELICA, a t. of Peru, about 80 m. to the w.n.w. of Huamanga, stands, at an elevation of 11,000 ft. above the sea, on the e. declivity of the Andes. Its inhabitants, said to be about 10,000 in number, are chiefly engaged in the working of the neighboring mines of gold, silver, and quicksilver.

HUA'NUCO, a department in Peru, n. of the department of Lima; pop. '76, 77,988. The surface is rugged, the climate salubrious, and the soil fertile and well cultivated. Sugar and coffee are among the products, and there are large herds of sheep and cattle. This region is noted for ruins of ancient Indian civilization.

HUANUCO, a t. of Peru, on an affluent of the Huallaga (q.v.), which bears its own name, is situated on the e declivity of the Andes, at a distance of 180 m. to the n.n.e. of Lima. It contains 7,000 inhabitants, and is one of the most ancient places in the country.

HUARAZ', or HUARAS, a small t. of Peru, situated in a valley of the Andes, on the right bank of the river Santa, 150 m. s.e. of the seaport of Truxillo. Pop. 6,000.

HUBBARD, JOSEPH STILLMAN, 1823–63; b. Conn.; graduated at Yale, and in 1844 was assistant to Sears C. Walker, astronomer in Philadelphia high-school observatory. In 1845 he was professor of mathematics, and assigned to the naval observatory at Washington, where he won a good reputation for scientific work.

HUBBARD, WILLIAM, 1621–1704; b. England; emigrated to Massachusetts, and graduated at Harvard in 1642. He was ordained in 1658, and was nearly all his life a minister at Ipswich. In 1688 he was president of Harvard. As an author he is known by *A Narrative of the Troubles with the Indians,* in which appears the first map known to have been made in America, and a *Memoir of General Denison.* He left in manuscript a history of New England, published in 1815 by the Massachusetts historical society.

HUBBARDTON, a t. in Rutland co., Vt., 50 m. from Montpelier, mentioned in history as the scene of a sharp conflict on July 7, 1777, between the rear-guard of gen. St. Clair's army, retiring from the evacuation of fort Ticonderoga, and a considerable British force under generals Fraser and Riedesel. The Americans, under col. Warner, were driven from the town, but the British lost severely in killed and wounded.

HUBER, FRANÇOIS, a Swiss naturalist, was b. at Geneva, July 2, 1750. At an early age he lost his eyesight, and some years after this married a Mlle. Lullin, by whose assistance and that of an intelligent domestic named Burnens he made a vast variety of original and important observations on the habits of bees, which did much to correct the errors and imperfections of previous writers. Huber's first work was entitled *Lettres à Ch. Bonnet* (1792). It was reprinted in 1796, and again in 1814, under the title of *Nouvelles Observations sur les Abeilles.* In his latter years Huber derived important aid in his studies from his son Pierre (born 1777, died 1840), the author of a valuable treatise on the *Habits of Ants* and of several able memoirs relating to zoology and meteorology, which are to be found in the Mem. Soc. Genève between the years 1821 and 1830. Huber died at Lausanne, Dec. 21, 1831.

HUBER, JOHANN NEPOMUK, b. Germany, 1830; graduated at Munich university, in which institution he became professor in 1859. He was a firm opponent of Jesuitism, and had much to do with organizing and strengthening the Old Catholic movement in Germany from and after 1871. He has been a voluminous writer in favor of free discussion of theological questions and against certain Roman Catholic dogmas, notably that of papal infallibility.

HUBER, PIERRE, 1777–1840; b. Switzerland; eminent as an entomologist, devoting his attention especially to bees, ants, and butterflies. His most important work is *The History and Nature of Ants.* He afforded great assistance to his blind father, François Huber; and, in turn, gained much of his own knowledge from the deep investigations of the latter.

HUBERTUSBURG, a royal hunting-seat, not far from Leipsic, built in 1721 by Augustus III., then prince, afterwards king and elector. It was much injured during the seven years' war, and has a historic celebrity on account of the treaty by which that war was ended, called the peace of Hubertusburg. This treaty of peace was signed

here on Feb. 15, 1763, by the representatives of Prussia, Austria, and Saxony; and by it the position of Prussia was established amongst the great powers of Europe. Maria Theresa relinquished all claim to the provinces which had been acquired by Prussia; and Frederick the great restored his electorate to the king of Poland, elector of Saxony.

HUBMEYER, or HÜBMAIER, BALTHAZAR, 1480–1528; b. Germany; one of the leaders of the Anabaptist party; a professor of theology and a preacher. He was persecuted for his reformation doctrines, and fled to Moravia, where he organized an Anabaptist congregation. He was burned at the stake, March 10, 1528.

HÜBNER, RUD. JUL. BENNO, one of the most eminent painters of the modern German school, was born at Oels, in Silesia, in 1806, and first attracted attention by his picture of "Ruth and Boaz." In 1839 he settled at Dresden, where he has been a professor since 1841. His principal productions are: "Samson overthrowing the Pillars of the Temple," "The Departure of Naomi," "Christ and the Evangelists," "Job and his Friends," "The Lovers of the Canticles," "Happiness and Sleep," "Christ in the midst of the People," "The Fisherman" (from the ballad of Goethe), "The Golden Age," and "The Dispute between Luther and Dr. Eck at Leipsic." Hübner belongs to the great historic and religious school of German art, whose principal seat is Dusseldorf.

HUC, EVARISTE RÉGIS, a distinguished missionary and traveler, was b. at Toulouse, Aug. 1, 1813. He was educated in his native city, and about his 24th year he entered the missionary congregation of the Lazarist fathers, and received holy orders at Paris in the year 1839. Almost immediately after his ordination, he joined the missionary expedition of his order to China. After he had spent about three years of missionary life in the northern districts of China, the new apostolic vicariate of Mongolia was founded, and Huc, in company with a priest of the same congregation, père Gabet, and a single native Chinese convert, undertook to explore the new district, and to ascertain, for the guidance of the mission, its extent and its missionary capabilities. After a few months' study of the Tartar dialects, they set out from the missionary station, n. of the great wall, called Si-wang, towards the close of 1844; and after a journey of excessive hardship over the high tablelands of Tartary, they took up their quarters for some months in one of the lamaseries, or Tartar monasteries. Having here become familiarized in some degree with the Thibetan language, they succeeded in making their way, in Jan., 1846, to H'lassa, the capital of Thibet and the residence of the grand lama; but scarcely had they settled in that city, when an order for their immediate expulsion from the country was obtained from the lama by the Chinese resident in H'lassa. They were not permitted to choose their own route homewards, but, having been put in charge of a Chinese escort, were carried back a journey of nearly 2,000 miles to the extreme s., and arrived in Oct., 1846, at Macao, where they were subjected to a tedious trial by the Chinese tribunals. In the end, they were permitted to return to the missionary station of Si-wang, from which they had originally taken their departure. Huc's health having been completely broken down, he sailed from Macao in the beginning of Jan., 1849, and in the autumn of the same year reached his native city of Toulouse. In the following year he returned to Paris, where he published *Souvenirs d'un Voyage dans la Tartarie, le Thibet, et la Chine pendant les Années*, 1844–46 (2 vols., Paris, 1852). This was followed in 1854 by a similar record of his Chinese experience (*L'Empire Chinois*, 2 vols., 3d edit. 1857), and in 1857 by an elaborate historical work on Christianity in China (*Le Christianisme en Chine*). All these works have been translated into English and most other European languages. The strangeness of some of the incidents recorded in the book on Thibet provoked some degree of incredulity in certain quarters; but capt. Blakiston, a later traveler in the same regions, which have hitherto been almost a *terra incognita* for Europeans, bears unhesitating testimony to the fidelity of père Huc's narrative and description.

During his latter years père Huc, in order to devote himself more freely to his literary occupations, withdrew from the Lazarist congregation. His health, however, never fully recovered from the fatigues of his Thibetan expedition, and he died in Paris, March 31, 1860, at the early age of 46.

HUCKABACK, a very coarse kind of linen cloth, figured somewhat like damask; it is usually employed for common toweling.

HUCKLEBERRY, *Vaccinium*, a genus of small shrubs, of the natural order *vaccinieæ*, having a 4- to 5-toothed calyx; a 4- to 5-cleft bell-shaped or urceolate corolla, with the limb bent back; 8 or 10 stamens, with two-horned anthers; and a 4- to 5-celled many-seeded berry. The species are numerous, mostly natives of the northern parts of the world, with evergreen or deciduous, more or less ovate leaves. The COMMON HUCKLEBERRY or BILBERRY (*V. myrtillus*), called inScotl and the *blaeberry*, is very common in Britain, and in the middle and north of Europe. It is found also in Iceland and in the northern regions of North America. It delights in dry situations, but is often found in woods, and often on very elevated mountains. It varies from a few inches to almost two feet in height, and has ovate deciduous leaves and dark purple berries. A variety occurs, but rarely, with white berries. The berries are very sweet and agreeable, and

are much used for making jelly. A kind of spirituous liquor is also made from them in Germany. The BOG HUCKLEBERRY, or GREAT BILBERRY (*V. uliginosum*), is common in the northern parts of Britain and in the n. of Europe and Asia. It is said to cover extensive tracts in Greenland. It grows in marshy situations, and is a taller plant than the common huckleberry. It has deciduous, obovate, entire leaves, and a fruit larger than the common huckleberry and inferior to it in flavor. The fruit is said to cause giddiness when eaten in large quantity. An intoxicating liquor is made from it in Sweden and in Siberia. The only other British species is the RED HUCKLEBERRY (*V. vitis idæa*), which is often called *cranberry*, because of the similarity of its acid fruit to the cranberry (q.v.). It is a native of the n. of Europe, Asia, and America, and is plentiful in some parts of Britain. Its fruit is much esteemed for preserves, and is used in the same way as the cranberry. Large quantities are sent to the s. of Europe from the shores of the gulf of Bothnia. The plant is a pretty dwarf shrub, with obovate evergreen leaves and racemes of flowers. *V. buxifolium* is generally regarded as a mere American variety of it.—Many species of *vaccinium* are in occasional cultivation as ornamental shrubs, and the fruit of most of them is agreeable, although in general it wants acidity. Their more general cultivation has perhaps been prevented by the prevalent notion that they require a peat soil, but they succeed on other soils also. Most of them are North American, and the fruit of some of them is often brought to market in North American towns. The BLACK HUCKLEBERRY (*V. angustifolium* or *gaylussacia angustifolia*) is a shrub about 2 ft. high, much branched and erect, with deciduous oval leaves. The berries are of a shining black color, and sweet. It is widely diffused from Canada to Georgia. The BLUE TANGLEBERRY (*V. frondosum* or *gaylussacia frondosa*) is a rather larger and more spreading shrub, which grows near lakes and springs. The fruit is slightly acid. The BEAN HUCKLEBERRY (*V. ursinum* or *gaylussacia ursina*) is found on the mountains of North Carolina; the BOX-LEAVED HUCKLEBERRY (*V. brachycerum* or *gaylussacia brachycera*) in Pennsylvania and Virginia. There are other North American species, as *V. Canadense*, *V. humifusum*, and *V. parvifolium*, humble evergreen shrubs. Several species are natives of Mexico. *V. arctostaphylos* is a native of the coast of the Black sea; and *V. padifolium* is a native of the Caucasus and of Madeira, on the loftiest parts of which island it forms impenetrable thickets, growing from 6 to 10 ft. high.

HUDDERSFIELD, a parliamentary borough and important manufacturing and market town of England, in the West Riding of Yorkshire, is situated in the midst of a fertile district, on an acclivity rising from the left bank of the Colne, 16 m. s.w. of Leeds and about 25 m. n.e. of Manchester. It is remarkably regular, is well built and drained, and very healthy. Upon the Holme and the Colne, which unite in the town, numerous mills have been erected for the manufacture of woolen fabrics, and for fulling and washing the goods manufactured. Huddersfield stands in the center of a district rich in coal, and its natural advantages are enhanced through its direct connection with the principal seats of manufacture in the n. of England, by means of the London and North-western, Lancashire and Yorkshire, and Manchester, Sheffield, and Lincolnshire railways. Among its churches, several are noteworthy in an architectural view. It has a proprietary college, now in connection with the London university; a collegiate school, and many other educational institutions; a circular cloth-hall, 2,640 ft. in circumference, in which a market is held for woolen goods every Tuesday, and for general produce every Saturday; an infirmary; and in the vicinity of the Lockwood Spa baths, where the water is strongly sulphureous. Huddersfield is the chief seat in the n. of England of what is called the "fancy trade," comprising shawls, waistcoatings, flushings, etc., of the most elegant patterns and the finest fabric; it also carries on extensive manufactures of narrow and broad woolen fabrics, cassimeres, serges, and cords. It is connected by canals with the Mersey and the Humber. The parliamentary borough sends one member to the house of commons. Pop. '71, 74,358.

HUDSON, a river in New York, United States, and one of the most beautiful and important in America. It rises in the Adirondack mountains, 4,000 ft. above the level of the sea, and its head-streams are the outlets of many mountain lakes in the north-eastern portion of the state. At Glens Falls it has a fall of 50 ft., and soon after, taking a southerly course, runs nearly in a straight line to its mouth at New York city. At Troy, 151 m. from its mouth, it is affected by the tide and becomes a broad deep river, having a width of from 300 to 700 yards, and deep enough for the largest river steamboats and for ships to Hudson, 116 miles. At Newburg, 61 m. from New York, the river enters the highlands, which rise abruptly from the water to the height of 1200 to 1600 feet. Here the scenery is of great beauty and grandeur, and is admired by all travelers. Several of the heights are crowned with the ruins of fortifications built to prevent the passage of British ships in the war of independence. Here was the scene of Arnold's treason and the sad fate of maj. André. Emerging from the highlands, the river widens into a broad expanse called the Tappan Zee. Below, on the w. bank, on the New Jersey shore, rises an almost straight and perpendicular wall of trap-rock, from the river's brink to a height of 300 to 500 ft., called the palisades, extending 15 m. to the upper portion of the city of New York. The river is here from 1 to 2 m. wide, and here it falls into New York bay.

Its whole length is about 300 m., and its principal tributaries are the Hoosic, Mohawk, Walkill, and Croton. The steamboats which ply on the Hudson are among the finest and fastest in the world. Some are more than 400 ft. long, are fitted up with great luxury, and attain a speed of 23 to 24 m. an hour. The Hudson River railway runs along the margin of the river on the e. bank to Albany. By this river, and the Erie canal, and several railways New York is connected with the great lakes and the west. The river is named from the English navigator who discovered it, 1609. The first successful experiment in steamboat navigation was made on this river by Robert Fulton in 1807.

HUDSON, called also the NORTH RIVER, "the Rhine of America," one of the most important and beautiful streams of the United States. It rises in the Adirondack mountain region, and runs almost due s. from the neighborhood of lake George to New York bay, a course of nearly 300 miles. Down as far as Troy it is broken by falls and rapids, but thenceforth to the sea it is a tidal stream varying from a quarter of a mile to a mile in width, and with the exception of the shallows a short distance below Albany, in every part navigable for steamboats and light-draught sailing-vessels. It has been improved on the shallow part, and there is now no obstruction as far up as Troy, 151 m. above New York. The scenery of this river is especially fine. Sailing n. from New York city one passes on the e. side the heights of Fort Washington and the village of Inwood on the upper part of Manhattan island; Spuyten Duyvel creek, connecting with the Harlem river and so separating Manhattan from the mainland; then the village of Riverdale, near which are the buildings of Mt. St. Vincent, the mother-house of the sisters of charity, the central building being a granite castle originally erected for his own dwelling by Edwin Forrest, the actor; the suburban city of Yonkers, one of the most beautiful of towns both naturally and in its elegant residences; and the villages of Hastings and Dobb's Ferry. On the w. side the palisades extend, an unbroken wall of rock from 250 to 600 ft. high, from Hoboken, opposite New York, to Piermont, nearly opposite Dobb's Ferry. At this point, 20 m. from New York, the river spreads out into the Tappan Zee, 3½ m. wide and 10 m. long. On the e. shore are Irvington, just n. of which is Sunnyside, the home of Washington Irving; Tarrytown, with Sleepy Hollow close by; and Sing Sing, a beautiful village, with the state penitentiary conspicuous from the river. All along this part of the river-bank are palatial residences with park-like grounds. On the w. side the palisades fall back into sloping hills some miles distant from the river, and give place for the villages of Piermont and Nyack and their adjoining farms. Above Nyack the mountains again come out to the river, and on the e. side Croton point, projecting from near the village of Cortland, bounds Tappan Zee on the n. and separates it from Haverstraw bay, named after the village which is the great brick manufactory of the country. Haverstraw bay in turn ends northward with the narrow pass between Stony Point on the w. and Verplanck's Point on the east. The highlands now loom up boldly in front, and after we pass Peekskill, on the right, the river narrows again and winds between Anthony's Nose on the e. and Dunderberg and forts Clinton and Montgomery on the west. Bending our course to the n.e. and then to the n.w., we pass around West Point, the picturesque seat of the U. S. military academy, then by Cornwall, also on the w. bank, and the river widening into the bay named from Newburg, a beautiful city rising from the w. bank, while 15 m. above, on the e. bank, is the city of Poughkeepsie. The course of the river now is more directly n. and s., and we pass on the e. the villages of Rhinebeck, Barrytown, and Tivoli, and on the w. Rondout and Kingston, since 1872 united in one city, the villages of Saugerties and Malden, and Catskill, with the mountains of that name towering just inland. A little farther up, on the e. side, is the city of Hudson, and above Hudson the villages of Stuyvesant, Castleton, and Greenbush, and on the w. side Athens, Coxsackie, New Baltimore, Coeymans, Overslaugh, and the city of Albany. Here the river is crossed by the first bridge, that of the New York Central railroad. A few miles above, the Mohawk river, the largest branch, enters from the w., and close by it the Erie canal, while on the e. side stands the city of Troy. The upper river flows through a picturesque country, and along its banks are a number of handsome towns and villages, among the most important being Lansingburg, Waterford, Fort Edward, and Glens Falls. The Hudson river was seen by Verrazano in 1525, but was not explored until the arrival of Henry Hudson in Sept., 1609. He went up nearly to the present site of Albany, and named the stream "the river of the mountains." It was afterwards called Mauritius, after prince Maurice of Nassau, and finally the Hudson or, geographically, the North river, the Delaware being the South river. Its Indian name was Shatemuc. It was on the Hudson river that Robert Fulton made his first successful experiments in steam navigation.

HUDSON, a co. in n.e. New Jersey, between the Hudson and Passaic rivers, crossed by the New York, Lake Erie, and Western, the Morris and Essex, and the New Jersey Northern railroad; 75 sq.m.; pop. '70, 129,027; in '80, 187,950. The surface is generally rough, the eastern limit being bounded by the palisades, on the Hudson river, and the soil is tolerably fertile. The chief productions are garden vegetables for city market. Co. seat, Jersey City.

HUDSON, a city of New York, U. S., on the e. bank of the Hudson river, 116 m. n. of New York and 29 m. s. of Albany. It is a beautifully situated and well-built city, is a port of entry, and formerly had a large amount of shipping engaged in foreign trade and the whale-fisheries. It is now chiefly engaged in the manufacture of iron and in the export of agricultural staples. It has a fine court-house, city-hall, eleven churches, public library, orphan asylum, and five newspaper offices. Pop. '70, 8,615.

HUDSON (*ante*), a city in Columbia co., N. Y., on the Hudson river and the New York Central railroad, 28 m. s. of Albany, at the terminus of a railroad to Boston; pop. '75, 8,615. It is one of the oldest cities in the state, having been incorporated in 1785. Among its public buildings are a court-house, city-hall, more than a dozen churches, an academy, a public library, and a number of manufactories, furnaces, and foundries.

HUDSON, a village in Summit co., Ohio, at the junction of the Cleveland and Pittsburg with the Cleveland, Columbus, and Mt. Vernon railroads, 25 m. s.e. of Cleveland; pop. 1800. It is the seat of Western Reserve college, organized in 1827.

HUDSON, FREDERIC, 1819–75; b. Mass.; for more than 30 years connected with *New York Herald* as principal or managing editor under Mr. Bennett. Hudson wrote an elaborate *History of American Journalism*, a careful and instructive compilation of the rise and progress of the press in the United States. He met his death at Concord, Mass., by being run over by a train of cars while driving.

HUDSON, GEORGE, English railway director and speculator, was b. in 1800, and apprenticed to a linen-draper in the city of York, where he subsequently carried on business for himself. He took an early share in railway speculation, and was appointed chairman of the North Midland company. His plans of management were carried out, schemes of railway annexation and extension were undertaken, embarrassed lines were relieved, and rivals were subdued. He was elevated into the dictatorship of railway speculation; everything he touched turned into gold; and Hudson was everywhere known as "the railway king." The shares of the lines with which he consented to become connected went up, and he was said to have made £100,000 in one day. He bought large estates; was three times elected lord-mayor of York; was sent to parliament by the electors of Sunderland; and found his acquaintance courted by persons of the highest rank. When the railway mania was at its height a statue to Hudson was proposed, and names were put down for £25,000; but before the money could be collected the popularity of the "railway king" was on the wane. His connection with the Eastern Counties railway led to some exposures. The accounts had been "cooked;" matters had been "made pleasant;" and dividends had been paid out of capital. Suspicions were excited in regard to his direction of other companies, shares fell, the bubble burst, the railway monarch was deposed, and encountered nothing but invective from quarters which had pursued him with adulation. Every board-room was closed against him, and his suddenly acquired gains were almost swept away. The constituency of Sunderland, however, continued to elect him as their representative until March, 1859. He afterwards resided abroad, in comparatively narrow circumstances, and died Dec. 14, 1871.

HUDSON, HENRY, a distinguished navigator. His early history is unknown. He undertook his first voyage for the discovery of a n.e. passage in 1607, in a small vessel with ten sailors, but failed in this attempt. In his second voyage, in 1608, he reached Nova Zembla. He undertook a third voyage in 1609 from Amsterdam, at the expense of the Dutch East India company. Giving up all hope of finding a n.e. passage, he sailed for Davis's strait, but came upon the American continent about 44° n. lat., and steering southwards, discovered the mouth of the river which now bears his name. He sailed upon his last voyage in April, 1610, with 23 sailors, and reached Greenland in June. Steering westward, he discovered the strait now known as Hudson's strait, and passed through it and entered the great bay which has received the name of Hudson's bay. Although very insufficiently supplied with provisions, he adopted the resolution of wintering in these desolate regions in order to prosecute his discoveries further in the following spring. He proceeded to carry this design into execution, but his provisions became so much exhausted that he was under the necessity of returning. An incautious utterance of his opinion, that in the destitute condition to which he was reduced he would be obliged to leave some of his people behind, led to his death. The sailors mutinied and placed him, with his son and some others who adhered to him, in a small boat, at the mercy of the waves and of the savages. His fate was revealed by one of the conspirators. An expedition was sent from England in quest of him, but no trace of him or of his companions in misfortune was ever discovered.

HUDSON, HENRY NORMAN, b. Vt., 1814; graduated at Middlebury college, and was a teacher in Kentucky and Alabama. He devoted much of his time to the study of Shakespeare, and in 1848 published two volumes of lectures on the plays of the great author. About 1844 he joined the Protestant Episcopal church, and in 1849 took priestly orders in New York city. From 1850 to 1857 he issued an elaborate Shakespearean commentary in 11 vols., and in 1860–61 lectured on the same themes. In the war of the rebellion he was chaplain in the union army, and has since been engaged in editorial work. Besides his works on Shakespeare he has published *A Chaplain's Campaign with General Butler*, *Sermons*, etc.

HUDSON, Sir JAMES, G.C.B., diplomatist, is the son of a Yorkshire gentleman, and was b. in London in 1810. He was educated at Rugby and Westminster, and subsequently studied at Paris and Rome. He was made private secretary to William IV.; and after the king's death entered the diplomatic service, and became secretary of legation at Washington in 1838, at the Hague in 1843, and at Rio de Janeiro in 1845. In 1850 he was appointed minister at Rio, but was transferred to Florence in 1851, and to Turin Jan., 1852. His counsels exercised great influence over the Sardinian government; and the conclusion of a commercial treaty between that country and England, the accession of Sardinia to the treaty of alliance between England and France against Russia, and the dispatch of a Sardinian army to the Crimea, were services which procured for him the dignity of K.C.B. The long train of stirring events that resulted in the united and independent kingdom of Italy demanded the watchful vigilance, and sometimes the active interference, of the British minister at the court of Turin. Hudson never forgot that he was the minister and representative of a constitutional government which sympathized with the aspirations of the Italians for national independence, and which had therefore the privilege to warn and counsel as well as to animate. He retired from Turin in 1863. His diplomatic course has not escaped the animadversion of the partisans of things as they were, but it has commanded the approbation of the vast majority of his countrymen.

HUDSON'S BAY, a spacious gulf in the n.e. section of the American continent, may be regarded as an arm at once of the Arctic sea and of the Atlantic ocean. With the Atlantic ocean it communicates by means of a strait, which, besides being solidly bridged for about ten months of the year, is beset, even during its brief period of navigation, by detached floes and bergs of ice. The eastern portion of this outlet is broken up into two branches, offsets of Davis's strait, the more northerly bearing the name of Frobisher, and the more southerly that of Hudson. It is fully 400 m. long, and averages at least 100 m. in width. With the Arctic sea, again, Hudson's bay is connected by channels, which, notwithstanding the comparative lowness of their latitude, have proved far less practicable than the Arctic sea itself, never having been navigated throughout; but it is only within these 25 years that this hopeless result has been definitively accepted by the world.

Hudson's bay, taken in its narrowest sense, extends in n. lat. from 51° to 62½°, and in w. long. from 76½° to 95°. When compared with the corresponding regions on the eastern side of the Atlantic, the shores of Hudson's bay possess a singularly inhospitable climate. At York Factory, lying nearly in the latitude of Aberdeen, the finest weather of summer is liable to a wintry temperature through a mere change of wind; and the most southerly extremity of the gulf is beset for months by snow at the very season when the Faroe islands, stretching as far n. as the parallel of its opposite end, yield available pasture to sheep and cattle.

Though Hudson's bay is not particularly remarkable for the extent of its drainage, yet towards the s. and w. its basin meets at once the waters of the St. Lawrence, the Mississippi, the Columbia, and the Mackenzie. Its largest feeder, the Nelson, fills perhaps a full half of the area, touching the Rocky mountains on the w., embracing Rainy lake on the e., and considerably overlapping the international boundary on the south.

HUDSON'S BAY COMPANY, a corporation erected in 1670 by Charles II., primarily consisted of prince Rupert, the king's cousin, and certain specified associates. It was invested with the absolute proprietorship, subordinate sovereignty, and exclusive traffic of an undefined territory, which, under the name of Rupert's Land, comprised all the regions discovered, or to be discovered, within the entrance of Hudson's strait. Rupert's Land was decidedly the most extensive of the dependencies of England, being held to embrace all the lands that poured water into Hudson's bay or Hudson's strait. For more than a century, however, the grantees confined themselves to the coast. About the period of the formation of the American republic their advance into the interior was accelerated, if not occasioned, by the more mature development of an ancient rivalry. From about the middle of the 17th c.—an epoch antecedent to the charter—New France, besides stretching, in name, to the arctic circle, had, in reality, advanced to the shores of Hudson's bay; and this position of affairs was virtually recognized by that provision of the letters-patent which exempted from their operation any actual possessions of any Christian prince or state. Though the claims of France, after being confirmed in 1697 by the treaty of Ryswick, were at last abandoned in 1713 by the treaty of Utrecht, yet, in point of fact, adventurers from the great lakes, while Canada was still French, had penetrated, in quest of peltry, far up the Saskatchawan towards the Rocky mountains. Such overland enterprises—interrupted, for a few years, by the conquest and cession of 1759-63—soon came to be prosecuted, with more systematic energy, under English auspices, till, in 1783, they led to the formation of the North-west company of Montreal. After an age of stubborn competition, the Hudson's bay company coalesced, in 1821, with its formidable opponent.

But the two members of the new partnership had already almost doubled the original field of contention. The older association had, about 1770, traversed the basin of the Coppermine; and, fully 20 years later, the younger one had descended the Mackenzie to the Arctic sea, and had, through the barrier of the Rocky mountains, reached

the Pacific ocean. Even in general equity, a body which now represented all the discoverers had a peculiar right to the discoveries themselves; but beyond general equity, a secondary provision of the letters-patent of Charles II. had regarded such discoveries, at least for the purposes of trade, as accretions to the primary grant. Accordingly, when, in 1821, parliament, in view of the intolerable evils of competition, empowered the crown to issue licenses for the "Indian territories"—expressly declared to be all the wildernesses of British North America to the w. of Rupert's Land—the government exercised this statutory authority in favor of the Hudson's bay company as recast and extended by the coalition. So far as commerce was concerned, there was now no practical difference between Rupert's Land and the Indian territories, excepting that the charter of the former was perpetual, and the license of the latter was to be for 20 years at a time; and thus the newly modified association virtually ruled the western world, through 75° of long., from Davis's strait to Mt. St. Elias, and, through 28° of lat., from the mouth of the Mackenzie to the borders of California.

About 20 years after the coalition, Oregon from the borders of California to the parallel of 49° n., which had always been open to Americans by international arrangement, was given up to the United States by the same treaty which sacrificed sections of Canada and New Brunswick; in 1859 the rest of the tramontane tract was brought within the pale of civilization as the national colonies of Vancouver's island and British Columbia; and lastly, as the second term of the license was, in 1859, also permitted to expire without renewal, the remainder of the "Indian territories" was then potentially thrown back into the condition from which the statute of 1821 had seen fit to rescue it.—In all these cases, excepting, of course, the case of Oregon, the Hudson's bay company would appear to have lost rather formal privilege than actual influence, retaining, if not a legal monopoly as of old, at least a commercial supremacy on a wider basis.

Though the withholding of the license neither affected nor professed to affect Rupert's Land, yet between it and the remaining portion of the Indian territories the difference, so far as Hudson's bay company was concerned, was little more than nominal; and in 1869 the company made a formal cession to the British government of whatever territorial claims remained, receiving an indemnity of £300,000 from the Dominion of Canada, to which the whole territories were forthwith annexed. It was, however, stipulated that the company should retain all its forts, with 10 acres of ground at each, and one-twentieth of all the land from the Red river to the Rocky mountains, besides blocks to which it made special claim. At this reservation the Canadians rather grumble, as the land is meanwhile kept unimproved, though it gains indefinitely in value by the improvements made around it by the labor of others. Since the transfer to Canada, the government has entered into treaties with the Indians, by which the latter have surrendered their right to the land on certain conditions, particularly the setting apart of a certain amount of land for their exclusive use, the annual payment of $5 to each individual, and certain presents of clothing, food, utensils, and cattle. The territory has been organized in three divisions: 1. Manitoba (see RED RIVER SETTLEMENT); 2. Keewatin, embracing that portion of the Hudson's bay territory e. and n. of Manitoba; and 3. The North-west territory, including the region between these and British Columbia. During its monopoly, the company kept strict faith with the Indians (fulfilling every bargain, though it possibly bought for a few trinkets furs worth pounds), and gained their confidence by kindness and sympathy. Its great influence for good over the half-breeds also is not to be forgotten. Over a territory with ports further apart than London and Mecca, Paris and Samarcand, the organization of the company was perfect, and its operations seemed to go as if by clock-work.

Formerly there were but few immigrants into the Hudson's bay territory. Most of the settlers were either retired servants of the company or their offspring. The few immigrants in pursuit of agricultural enterprise were sent to Rupert's Land at the expense of others, such as the earl of Selkirk (see RED RIVER SETTLEMENT), or the company itself. But since the annexation of the territory to Canada, and the formation of the province of Manitoba, there has been an influx of immigrants into the land; and this influx will become broader and deeper, for a finer grain-growing country than that to the n.w. of lake Superior does not lie under the sun. The loss of territorial control has not in the least affected the Hudson's bay company as a trading community. Its organization is still complete. Its shares or parts are indeed now quoted on the stock exchanges, an arrangement quite recently come to, but this only means that a wider public may enjoy its benefits than was formerly allowed under a very close corporation. It has still its offices, its outlets for young energy to risk itself "over flood and fell;" but, best of all, very large dividends. As a single part, between one year and another, ranges from about £300 to about £500, the total revenue may easily be found to vary from about £63,750 to about £106,250—averaging perhaps about £80,000, so as to yield about £48,000 to the proprietors and about £32,000 to the wintering partners. This income arises almost entirely from fur; for other articles, such as tallow, oil, feathers, fish, timber, etc., have never been of much account. The working organization of the company is as follows: A young man commences with the rank of apprentice-clerk, or apprentice-postmaster. These postmasters are those in charge of the various posts which have been from time to time erected around the central one, at distances varying from about 200 to 500 miles. Such settlements are supplied with goods in accordance

with the amount of trade likely to be done. In the fall of the year the Indians collect and get what is called "debt" proportionately with their known qualifications as hunters. They then depart to their hunting-grounds, and are visited at various periods during the winter by the servants of the company (generally half-breeds), who bring back with them any peltries (or furs) that may be on hand. These, in turn, are made into packs and transmitted, in spring, by canoes to the central post, and from thence are transmitted either to England or Canada, as the case may be. These skins are given to the traders in repayment of the "debt" paid to the Indians.

For further particulars, see Fitzgerald's *Examination of the Charter and Proceedings of the Hudson's Bay Company* and Montgomery Martin's *Hudson's Bay Company's Territories and Vancouver's Island*, both published in 1849—perhaps the leading works on opposite sides of a much-vexed controversy.

HUDSON'S STRAIT. See HUDSON'S BAY, *ante*.

HUÉ, the capital of Cochin China, or, more properly speaking, Anam, in the gulf of Tonquin, in the prefecture of Thua Thuan, 16° 30′ n. lat., 107° 12′ e. long., 10 m. from the mouth of the Hué river. It is built almost in the European style. Under the reign of king Cia-lung (1801–20) it was strongly fortified by French officers, to whom, with a French bishop, that monarch was indebted for his throne. It is accessible only to vessels of the smallest class, owing to the shallowness of the small river on which it is situated. Pop. variously estimated at from 30,000 to 100,000.

HUE AND CRY, a phrase, derived from the old process of pursuit with horn and voice, used in English law to describe the pursuit of felons. Whoever arrested the person pursued was so far protected that he required no warrant to justify the arrest; and even if the party turned out to be no felon, no action could be brought if the arrest was *bona fide*. But it was not only a ground of action, but an offense subject to fine and imprisonment, to maliciously and wantonly raise the hue and cry against a person. It was the duty of all persons to join in a hue and cry, and if a person who had been robbed, or knew of a robbery, failed to raise the hue and cry, he was liable to fine or imprisonment, or, according to some authors, to indictment. Hue and cry is now abolished.

HUELVA, a province in s.w. Spain, bordering on Portugal and the ocean; 4,118 sq.m.; pop. '70, 196,469. It is a mountainous region, thickly peopled but not much cultivated. There are mines of iron, copper, lead, and coal, with several springs and salt works. The capital is Huelva.

HUEL'VA, a maritime t. in the s. of Spain, capital of the province of the same name, which was formed out of a portion of the ancient kingdom of Seville (q.v.), is situated at the confluence of the Odiel and the Tinto, 63 m. w.s.w. of Seville, with which it is joined by railway. Its trade with Portugal and Cadiz is considerable, and it carries on an extensive tunny-fishery; but its chief commercial importance is derived from the copper-mines, the product of which in 1872 amounted to £651,559. The remains of a Roman aqueduct in the vicinity are now fast disappearing. Pop. 8,423.

HUERFANO, a co. in s. Colorado, traversed by the Denver and Rio Grande railroad; 1500 sq.m.; pop. '70, 2,250. The surface is rough and in some parts mountainous, with a good share of pasture-land. Stock-raising is the main employment. Co. seat, Walsenburg.

HUERTA, VICENTE GARCIA DE LA, a Spanish poet and critic of the 18th c., was b. in 1729 at Zafra, in Estremadura, but spent the greater part of his life in Madrid, where he held the office of principal librarian of the royal library, and where he died March 12, 1797. He early distinguished himself by his poetic talent. His tragedy of *Raquel*, founded upon the story of the love of king Alfonso VIII. for the fair Jewess Rachel and its tragical catastrophe, was received with great enthusiasm when first produced in 1778, and is to this day esteemed as one of the very best of modern Spanish tragedies. Huerta was a most zealous but not always a wise or skillful defender of the ancient Spanish national taste against the Gallicism which then prevailed. As a lyric and dramatic poet he shows great command of language and versification. His poems were published in two volumes (*Obras Poeticas*, Madrid, 1778–79). Huerta edited the *Teatro Español* (17 vols., Madrid, 1785–86), a collection of the best works of the older Spanish dramatists.

HUES'CA (the *Osca* of the Romans), a very old and picturesque t. of Spain, capital of the modern province of the same name (see ARAGON), is surrounded by old walls once surmounted by 99 towers, two of which only remain, and is situated in the midst of a plain covered with vineyards, on the right bank of the Isuela, 50 m. n.e. of Saragossa. Among its chief buildings are the cathedral, built in 1400, a beautiful Gothic edifice; the university, founded in 1354 by Pedro IV.; and the picturesque college of Santiago. It was once famous as a seat of learning. Tanning and manufactures of linens are here carried on to some extent. Pop. 10,068.

HUES'CAR, a small t. of Spain, in the province of Granada, is situated 75 m. n.e. of the city of that name, and is said to contain a pop. of about 6,000, who are chiefly employed in the manufacture of linen and woolen goods.

HUET, FRANÇOIS, 1814–69; b. France; a professor in the university of Ghent, and one of the forerunners of the Old Catholic movement. He was opposed to the absolutism of the pope, and undertook to establish Neocatholicism, which was very much like the system afterwards advocated by Döllinger and Hyacinthe. He published *Cartesianism, or True Renovation of Science; The Social Regeneration of Christianity; Essays on Catholic Reform*, etc.

HUET, PETER DANIEL, was b. at Caen, Feb. 8, 1630. His father had been converted from Calvinism, but died while Huet was still very young. The latter was educated in the Jesuit school of Caen, and was early distinguished by his extraordinary progress in almost every department of learning. He was a zealous pupil of Descartes and of Bochart—the latter of whom he accompanied on his visit to Stockholm in 1652, when he discovered and transcribed the MS. of Origen, which, subsequently, was the basis of his celebrated edition of that father. On his return to Caen, he gave himself up entirely to study; and as a preliminary to his translation of the text of Origen, he published, in 1664, his well-known essay *De Interpretatione;* but it was only at the end of 15 years' study that he published his edition of Origen's *Commentaria in Sac. Scripturam*, 2 vols. fol. (Rouen, 1668), with a most learned introduction, entitled *Origeniana*, which has since been reprinted in the great Benedictine edition of that father. In 1670 Huet received the degree of doctor of law; and soon after he was summoned to Paris to take part with Bossuet in the education of the dauphin. In 1679 he published his *Demonstratio Evangelica*. He had an active part, moreover, in the Delphin edition of the classics. In 1676 he entered into holy orders; and in 1678 was named abbot of the Cistercian abbey of Aunay, from which place is named his well-known work, *Quæstiones Alnetanæ de Concordia Rationis et Fidei* (1690). About the same time, also, he published a work *On the Site of the Terrestrial Paradise*, another *On the Voyages of Solomon*, which were followed later by his equally celebrated work in classical geography, *History of the Commerce and Navigation of the Ancients*. In 1685 he was named bishop of Soissons, a dignity, however, on which he never entered, being transferred to the see of Avranches in 1692. He was as zealous in the discharge of his episcopal duties as he had been in his devotion to literature; but his health having given way, he obtained permission to resign his see in 1699, and retired to the abbey of Fontenay, near Caen; but in 1701 he took up his residence in the Jesuits' house in Paris, and published in 1718 his autobiographical memoirs—a model of pure Latinity as well as a most interesting record of the history of his time. Huet died in 1721. His works were published in a collected form in 1712, and a volume of *Huetiana* appeared in 1722.

HUFELAND, CHRISTOPHER WILLIAM, one of the most distinguished physicians of modern times, was b. on Aug. 12, 1762, at Langensalza, in Thuringia. After having completed a general and medical education at the best schools in Germany, he was appointed physician in ordinary at the court of Weimar, where his father and his grandfather had previously filled the same office. Retaining this honorary title, he removed in 1793 to Jena, to be ordinary professor of medicine there; and after refusing a number of invitations to other places, he went from Jena to Berlin in 1798 with a number of very honorable professional appointments. On the foundation of the university of Berlin in 1809, he became one of its professors. He died Aug. 25, 1836. He had a very high reputation for skill and tenderness as a physician, and he was equally esteemed for his intellectual abilities and his noble and benevolent character. A number of benevolent societies and institutions owed their existence to him, and many others found in him a zealous and liberal supporter. His published works are numerous, chiefly on medical and physiological subjects. His *Makrobiotik*, or the Art of Prolonging Life, originally published in 1796, was translated into almost all the languages of Europe. Translations exist in Servian, Hungarian, and Hebrew. Amongst his most important works are one on scrofula, *Ueber die Ursachen, Erkenntniss, und Heilung der Skrofelkrankheit* (Berlin, 1795), which has gone through several editions and been translated into several languages; an advice to mothers on the Physical Treatment of Children, published in 1799; and his *Enchiridion Medicum*, or Introduction to the Practice of Medicine, published in 1836.

HUG, JOHN LEONHARD, was b. at Constance, June 1, 1765, studied at Freiburg, and in 1789 entered into priest's orders. In 1791 he was appointed professor of oriental languages and of the Old Testament, to which was added, in 1792, the professorship of the New Testament also. These united professorships Hug continued to hold uninterruptedly for upwards of half a century, with the exception of some brief occasional visits to the great libraries of Munich, Vienna, Paris, Milan, Rome, and Naples. The most important fruit of his biblical researches was his *Introduction to the New Testament*, which appeared in 1808, in 2 vols., and which, besides several German editions, has been translated into most of the European languages. His great eminence as a biblical scholar led to his being called on to take part in the arrangement of the newly organized studies of most of the German universities—as at Breslau, in 1811; at Bonn, in 1816; at Tübingen, in 1817; and again at Bonn, 1818 and 1831. He died Mar. 11, 1846. His works, which are indifferently in Latin and German, are chiefly in the department of biblical criticism; as, *On the Age of the Vatican MS.* (1810); *On the Canticle of Canticles* (1813, and again 1818); *On the Indissolubility of Marriage* (1816); *On the Alexandrian*

Version (1818); *Re-examination of Strauss's Life of Jesus*, 2 vols. (1835); but there are also some on subjects of classical criticism, especially an interesting work on the ancient mythologies (1812). See Maier's *Gedächtnissrede auf Hug* (1847).

HUGER, BENJAMIN, b. S. C., 1805; a graduate of West Point, serving in the Mexican war, and present at the surrender of Mexico. He was brevetted maj., lieut.col., and col. for gallant conduct. In 1861 he went with the rebellion and was made a maj.gen. in the confederate army. At the close of the war he settled in Virginia and engaged in farming.

HUGER, FRANCIS KINLOCK, 1764–1855; b. S. C.; the son of Isaac Huger, a revolutionary officer. He studied medicine under Dr. John Hunter and in Philadelphia, but is best known for joining in an attempt to take the marquis de Lafayette from his prison in Olmutz. He was arrested, and for eight months kept a prisoner. In 1798 he returned to America, and served in the second war with England in 1812. He was also in the South Carolina legislature.

HUGER, ISAAC, 1742–97; b. S. C.; one of five brothers who took the side of the colonies in the revolution. He was engaged in a number of battles and skirmishes, among which were the sieges of Savannah and of Charleston and the battle of Guilford court-house.

HUGGINS, WILLIAM, LL.D, b. London, 1824; an astronomer. In 1855 he built an observatory at his residence, in which he mounted a telescope of 8 in. aperture, and made some careful drawings of Mars, Jupiter, and Saturn. His attention was first engaged in observations on double stars, but afterwards he devoted himself to the spectrum analysis and the study of nebulæ and comets. With Dr. Miller he compared the spectra of about fifty stars directly in the instrument with the spectra of several terrestrial elements. They concluded that the stars are hot bodies, similarly constituted to our sun, and that they contain many of the substances found on the earth. One of the most remarkable of Mr. Huggins's subsequent discoveries was that of the nature of some of the nebulæ. He found that some of the bodies gave a spectrum of a few bright lines only, which showed that the light had emanated from heated matter in the state of gas; and further that one of the principal constituents of the gaseous nebulæ is hydrogen. He concluded, therefore, that the nebulæ are not clusters of stars too distant to be separately distinguished. He has since continued his prismatic researches by a re-examination of the nebulæ by a more powerful spectroscope, by which his former results have been confirmed. He has also examined the spectra of four comets, and has found that the greater part of the light of these objects is different from solar light. The spectrum of Winnecke's comet he found to be identical with the spectrum of carbon. His observations of the bright comet of the autumn of 1874 confirm his earlier ones, and show that carbon, probably with hydrogen, forms one of the constituents of cometary matter. Mr. Huggins has also shown that the proper motion of the stars in the line of sight can be determined from any small shift of position which the lines of their spectra may have suffered, and that Sirius is moving from the earth with a velocity of 27 m. per second. Of 30 stars examined, subsequently 19 were found to be receding and 11 approaching. He has made observations of the spectra of the solar prominences, and devised the method by which the forms of these objects may be seen. He has also succeeded in detecting the heat received at the earth from some of the fixed stars. On the occasion of the meeting of the British association at Edinburgh, in 1871, he was created honorary LL.D. of that university. He was president of the royal astronomical society of Great Britain, 1876–78.

HUGH CAPET. See CAPETIAN DYNASTY, *ante*.

HUGHES, BALL, 1804–68; b. England; became a sculptor, studying seven years with E. H. Bailey, and becoming a successful competitor for the prizes of the royal academy. In 1829 he came to New York and made a fine bust of Alexander Hamilton, which was placed in the old Merchants' exchange, but was destroyed in the great fire of 1835. There is a work of his now in Trinity church, an alto-rilievo of bishop Hobart, and there are some of his works in Boston. He also made the bronze statue of Nathaniel Bowditch, in Mt. Auburn cemetery, near Boston.

HUGHES, JOHN, D.D., 1797–1864; b. Ireland; came to the United States at the age of 20, and was educated at Mount St. Mary's (Roman Catholic) college, Emmettsburg, Md. In 1825 he became a priest, and had pastoral charge in Philadelphia, where he established *The Catholic Herald*. In 1842 he became bishop of New York. This was about the time of the "Native American" political excitement, and he became an ardent opponent of that movement, especially so far as it meant to prohibit the appropriation of public money to the schools of the Roman Catholic church. In 1850 he was made archbishop, and his personal power and character had much to do with the growth of the church in the United States. He was the founder of St. John's college, and Aug. 5, 1855, he laid the corner-stone of St. Patrick's cathedral in New York city, the finest church edifice in the country. Soon after the beginning of the rebellion he went abroad, at the request of president Lincoln, to secure the friendly offices of foreign courts, particularly that of France; and in 1863 he publicly addressed the draft-rioters in New York, dissuading them from violence.

HUGHES, THOMAS, English author and politician, second son of John Hughes, esq., of Donington Priory, Newbury, Berkshire, was b. at Uffington, Berks, in 1823. He was educated at Rugby under the celebrated Dr. Arnold; entered Oriel college, Oxford, in 1841, and took his degree of B.A. in 1845; was called to the bar at Lincoln's Inn in 1848, and became a member of the chancery bar. In 1856 he gave to the world *Tom Brown's School-days*—a picture of life at a public school, evidently written from the author's own personal experience, and recording the vivid and enduring impressions he brought with him from Rugby. This work attained great popularity both in England and America, especially among the young. It was followed, in 1858, by *The Scouring of the White Horse;* in 1861, by *Tom Brown at Oxford*, in which the mental history of his hero is continued, with sketches of college life and incidents; and in 1869, by *Alfred the Great.* Hughes pursued meanwhile the study and practice of the law. He gained the confidence and good-will of the working-classes by endeavoring to promote a better understanding between masters and men, and by teaching the latter the value of co-operation as a means of social elevation. He has, however, never failed courageously to rebuke the narrow prejudices and mischievous views held by certain members of trades-unions. At the general election for Lambeth in 1865, he was placed at the head of the poll, the working men being especially enthusiastic in securing his return. He was returned for Frome in 1868, which he continued to represent till 1874, and always took a prominent part in debates relating to the combinations of trades-unions, and the amendment of the law of master and servant. He was appointed queen's counsel in 1869. Hughes has written various pamphlets and articles in reviews.

HUGHS, a co. in s. central Dakotah, on the Missouri river, formed after the census of 1870.

HUGO, VICTOR MARIE, Vicomte, one of the most distinguished French writers of the present day, was b. Feb. 26, 1802, at Besançon, where his father was then commandant of the garrison. His mother was a native of La Vendée, and from her he imbibed romantic royalist sentiments, although his father was a most devoted follower of Napoleon. His youth was spent partly with his mother in Paris, partly in Italy and Spain, where his father held high appointments. He early acquired distinction by his poetic effusions; and before he was 30 years of age, his published works were numerous, and his name famous. Odes and ballads, romances, dramas, etc., flowed from his prolific pen. Shortly before the revolution of 1830 a literary revolution took place, at the head of which was Hugo. A band of young men, imaginative, ardent, and confident, sought to renovate French literature, by departing from classic rules and models, substituting a varied and very irregular verse for the monotonous Alexandrines of the old school, and making art precisely conform to nature, which they carried so far as even to bring into prominence things disagreeable, which nature herself is displeased with, and teaches us to keep out of sight. The new school, *la jeune France*, as they called themselves, formed the *Romanticists*, and their opponents, the Classicists. The literary war lasted several years. Hugo's drama of *Marion Delorme* was received with enthusiasm; and he added to his reputation by the publication of *Feuilles d'Automne.* In 1832 the ministry suspended one of his dramas, *Le Roi s'amuse;* but his popularity continued to increase, and in 1837 Louis Philippe made him an officer of the Legion of Honor, and in 1845 a peer of France. After the revolution of 1848 he was elected to represent Paris, both in the constituent and in the legislative assembly, in which he manifested democratic principles, and was one of the members of the extreme left who were banished from France for life by Louis Napoleon. He went to reside in the island of Jersey. In 1852 he assailed the ruler of France in a political pamphlet, *Napoleon le Petit;* and next year, in *Les Châtiments*, a series of poems written with great *verve*, in the same spirit. In 1856 he published his *Contemplations.* He refused to avail himself of the amnesty of Aug. 15, 1859; but on the fall of the empire, hastened back to his native country, joined in the republican movement, and was returned to the national assembly at Bordeaux, which, however, he soon quitted in disgust. He then went to Brussels, but the Belgian government expelled him from the country, and he had to seek refuge in Vianden, a village of Luxemburg, where *L'Année Terrible* was composed. Returning to Paris in July, 1871, he pleaded earnestly, but without effect, for the lives of the Communists. Hugo has given an account of his life in *Actes et Paroles*, 1870–72. In 1862 appeared *Les Misérables;* in 1869, *L'Homme qui Rit; Quatrevingt-treize* in 1874; his *Speeches* in 1875; the *Légende des Siècles*, 1877; *L'Histoire d'un Crime*, 1878; and *Le Pape*, a poem, 1878. Hugo's writings are often extravagant both in form and substance, and sometimes marred by an affected triviality of images and harshness of versification. Yet they have also great excellences; the command of language shown is wonderful; and as a lyric poet Hugo has, perhaps, never been equaled in France.

HU'GUENOTS (probably corrupted from the Ger. *Eidgenossen*, confederates), the name formerly given in France to the adherents of the Reformation, which movement commenced almost simultaneously in France and Germany. One of the most eminent names in the early history of French Protestantism is that of Farel (q.v.), and one of the first supporters of its cause was Margaret of Valois, queen of Navarre, the sister of Francis I. Subsequently, in the time of Calvin, many of the nobles and middle classes embraced the reformed religion. Francis I., however, opposed it with great severity,

and caused many to be burned as heretics. The alliance of Henry II. with the German Protestants gave at first an impulse to the cause of the reformation, but the aspect of things was again changed when the family of Guise obtained the ascendancy at court. Under Francis II., a chamber (*chambre ardente*) was established in each parliament for the punishment of Protestants; and executions, confiscations, and banishments were common in all parts of the kingdom. The Protestants took up arms against the government, choosing Louis I., prince of Bourbon-Condé, for their leader. On Feb. 1, 1560, in a meeting at Nantes, they resolved to petition the king for freedom of religion, and for the removal of the Guises; and in the event of his refusal, to seize the king's person, and proclaim Condé governor-general of the kingdom. But the court, being apprised of the conspiracy, fled from Blois to Amboise, and the duke of Guise was appointed governor-general. Some bands of Protestants, approaching Amboise with weapons in their hands, were easily defeated and taken; 1200 died by the hand of the executioner. The edict of Romorantin, in May, 1560, took the prosecution of heretics out of the hands of the parliament, and gave it into those of the bishops. By the assembly of notables in August, it was resolved that the whole matter of religion should rest until the next assembly of the states. Whilst the Guises plotted the death of the Protestant leaders, Charles IX. ascended the throne, a prince not yet of age; and the queen-mother, Catharine de' Medici (q.v.), having removed the Guises from the helm of the state, was compelled to seek the support of the Protestants against them and their party. In July, 1561, appeared an edict which freed the Huguenots from the penalty of death. For the complete termination of strife, the court opened a religious conference at Poissy on Sept. 3. The chief disputants were the cardinal of Lorraine on the one side, and Theodore Beza (q.v.) on the other. The effect of the discussion was to unite and embolden the Protestants, with whom the machinations of the Guises forced Catharine into closer alliance. On Jan. 17, 1562, appeared an edict, giving noblemen the right of the free exercise of their religion on their own estates.

The Guises and their partisans became exasperated. On Mar. 1, 1562, a company of Protestants met in a barn at Vassy for religious exercises, was attacked, and many of them were massacred by the followers of the duke of Guise. On this, Condé hastened to Orleans, and called his co-religionists again to his standard; whilst the Guises took possession of the persons of the king and his mother, and proclaimed the Protestants rebels. On Sept. 11, 1562, the royal troops, after much bloodshed, took Rouen, and on Dec. 19 a battle was fought at Dreux, in which, after a hard struggle, the Protestants were defeated. The duke of Guise marched on Orleans, but was assassinated in his camp before that city, Feb. 18, 1563. Hereupon the queen-mother hastened to conclude the peace of Amboise on Mar. 19, by which the Protestants were allowed the free exercise of their religion, except in certain districts and towns. Catharine, however, hated the new faith, and formed a close alliance with the Spaniards for the extirpation of heresy, retrenched the new liberties of the Protestants, and made attempts upon the liberty and the life of Condé and of the admiral Coligny (q.v.). These leaders of the Protestant party adopted the resolution of taking possession of the king's person. The court fled to Paris, which Condé invested; but on Nov. 10, 1567, a battle was fought at St. Denis between Condé and a much superior force under the constable Montmorency (q.v.), in consequence of which Condé fell back into Lorraine, where he effected a junction with an auxiliary force of 10,000 men from Germany, under prince John Casimir. After this, he again threatened Paris; upon which Catharine concluded peace at Longjumeau on Mar. 27, 1568, re-establishing the terms of the treaty of Amboise. Nevertheless, she proceeded to persecute the Protestants, of whom 3,000 were assassinated or executed. The Protestants having, however, received assistance in troops from Germany, and in money and artillery from England, began the third religious war. But on Mar. 13, 1569, they were defeated, and Condé their leader slain, at Jarnac by the royal troops under the duke of Anjou, afterwards Henry III. These misfortunes greatly dispirited the Protestants. Jeanne d'Albret, queen of Navarre, endeavored to reanimate them in an assembly at Cognac, and set up her son, afterwards Henry IV., as the head of the Protestant cause. Coligny became their military leader, and having received further assistance of troops from Germany, he laid siege to Poictiers, but was again defeated by the duke of Anjou at Montcontour, on Oct. 3. Fresh reinforcements from England, Switzerland, and Germany enabled Coligny to take Nimes in 1569, and to relieve Rochelle, whilst Lanoue obtained a victory over the royal troops at Luçon. Catharine and her son now sought for peace, to which the Protestants, weary of the hard contest, consented. The treaty, concluded at St. Germain-en-Laye on Aug. 8, 1570, gave to the Protestants an amnesty, the free exercise of their religion everywhere except in Paris, and the possession of a number of places of security.

Catharine, having failed to overthrow the Protestant cause in the open field, sought to accomplish her object by treachery, and by a general massacre of Protestants on St. Bartholomew's day (q.v.) 1572. Although deprived of their leaders, and weakened by the slaughter of great numbers of their best and bravest, the Protestants flew to arms. The duke of Anjou, after having lost his army before Rochelle, took advantage of his election to the throne of Poland, and on June 24, 1573, concluded a peace, by which the Protestants obtained the free exercise of their religion in their places of security, Montauban, Nimes, and Rochelle, and a certain concession of liberty of conscience. A

section of the Roman Catholic nobility, at whose head was the duke of Alençon, the youngest son of Catharine, from purely political motives, united with the Protestants in opposition to the government of the queen-mother and the Guises. Catharine, therefore, incited her third son, Henry III., who had now succeeded to the throne, immediately to recommence hostilities against the Protestants. But, contrary to all expectation, the Protestant cause was in the highest degree prosperous during the year 1575. A peace was concluded at Beaulieu on May 8, by which the Protestants were freed from all restrictions in the exercise of their religion, and obtained a number of places of security. The king also paid their German auxiliaries. The duke of Guise, thus frustrated in his political designs, originated a Catholic association, called the Holy League, at the head of which the king put himself in the assembly of the states at Blois, on Nov. 6, 1576, and then the sixth religious war began. Peace was, however, again concluded by the king himself at Bergerac, in Sept., 1577, on the former conditions; and Catharine, to diminish the power of the duke of Guise, entered into a private treaty with Henry of Navarre at Nerac, by which several places of security were made over to the Protestants. The terms of peace being violated by the court, Henry I., prince of Condé, son of Louis I., and, like his father, a leader of the Protestant party, commenced the seventh religious war (called the *guerre des amoureux*) in Nov., 1579, by the occupation of Lafère, and Henry of Navarre, in April, 1580, took Cahors. But Condé, having been driven out of Lafère by Matignon, and Henry of Navarre vanquished at Mont-Crabel by Biron, peace was concluded at Fleix, Nov., 1580.

There was now a comparatively long interval of repose till 1584, when, by the death of the duke of Anjou (formerly of Alençon), Henry of Navarre became heir to the throne of France. Hereupon Henry, duke of Guise, exerted himself for the revival of the league, entered into an alliance with Spain and the pope for the extirpation of heresy, declared the cardinal of Bourbon heir to the throne, and began hostilities against the Protestants. This war is commonly known as the "war of the three Henries." The king soon made terms with him, and declared all the privileges of the Protestants to be forfeited. The Protestants, having obtained troops from Germany and money from England, entered on the eighth religious war, which was prosecuted with various success, Henry of Navarre commanding the Protestant army. The duke of Guise, in the midst of these troubles, grasped the whole power of the state. But his designs with regard to the throne having become very evident, the king caused him and his brother the cardinal to be assassinated at the assembly of the states at Blois in Sept., 1588. In less than a year, the king was himself assassinated by a monk named Jacques Clement, and Henry of Navarre succeeded to the throne, and signed the famous EDICT OF NANTES (see NANTES), April 13, 1598, by which the rights of the Protestants were established and enlarged.

Under the reign of Henry IV., whose great minister, Sully, was himself a Protestant, the Protestants lived in tranquillity. But when, during the minority of Louis XIII., Mary de' Medici, the queen of Henry IV., assumed the reigns of government, the independence which the Protestants enjoyed stood too plainly in the way of a court bent upon absolutism. The king, indeed, took an oath in 1614 to maintain the edict of Nantes, but the marriage treaties with the Spanish court excited the apprehensions of the Protestants to such a degree that, in Nov., 1615, they made common cause with the prince of Condé, who had then set up the standard of rebellion. This they did contrary to the advice of the most sagacious of their own party. Although by the treaty of Loudun, May 4, 1616, they obtained a new confirmation of their freedom of worship, the court now only waited for an opportunity of breaking at least their political power. In June, 1617, a royal edict commanded the entire suppression at once of the Protestant church, and of political privileges, in the province of Béarn; but the provincial court at Pau refused to register the edict, and the matter lay over till 1620, when, at the instigation of the Jesuits, and of his favorite De Luynes, the king carried the edict into full effect by force of arms. The Protestants throughout all France took alarm, and hostilities again broke out in May, 1621. At the head of the Protestants were the two brothers, the duke of Rohan and the prince Soubise. Their cause, however, was feebly maintained; almost all the Protestant towns fell into the hands of the king, force, stratagem, and bribery being equally employed. At last, after the capitulation of Montpellier, Oct. 31, 1622, there followed a general peace, by which the edict of Nantes was confirmed, but the right of prohibiting the assemblies of the Protestants was assumed on the part of the crown. The court, however, paid little attention to the stipulations of the treaty, and when the government was involved in difficulties in Italy, the Protestants took the opportunity again to rise in arms. Soubise, with a fleet furnished by the town of Rochelle, oftener than once defeated the weak royal navy. Cardinal Richelieu (q.v.), who was now at the helm of affairs, found himself under the necessity of making offers of pacification, which were rejected. Hereupon the cardinal resolved upon the capture of Rochelle, the most important stronghold of the Protestants. This he accomplished after a heroic resistance by the inhabitants. The fall of Rochelle was speedily followed by that of Nimes, Montauban, Castres, and all the other Protestant strongholds. Now left defenseless, the Protestants were entirely dependent on the will of the court, which, however, made no attempt to deprive them of their liberty of conscience. It was Louis XIV., when he became superstitious in his old age, who, at the

instigation of Madame de Maintenon and his confessor Lachaise, commenced anew the persecution of the Protestants. He gradually deprived them of their equal civil rights, and endeavored to put down the Protestant church altogether. Bodies of troops, accompanied by monks, passed through the southern provinces, compelling the inhabitants to renounce their religion, demolishing the places of worship, and putting to death the preachers. Hundreds of thousands of Protestants fled to Switzerland, the Netherlands, England, and Germany. In vain was it attempted to restrain this self-expatriation by cordons along the borders. Many Protestants also made an insincere profession of Roman Catholicism. These, on the slightest appearance of relapse, were put to death. On Oct. 23, 1685, Louis at last revoked the edict of Nantes. (See Rulhière, *Eclaircissements Historiques sur les Causes de la Révocation de l'édit de Nantes*, 2 vols. Paris, 1788.) Hereupon began a new flight, followed by a still more fearful persecution of the Protestants. Their marriages were declared null; their children deprived of the right of inheritance, and forcibly shut up in convents; their preachers indiscriminately put to death. From the vicinity of Nimes, where they had always been very numerous, thousands betook themselves to the mountains of the Cevennes, and continued the exercise of their religion in secret. Amongst these and the mountaineers of the Cevennes, a remarkable fanatical enthusiasm displayed itself, and, under the name of Camisards, they maintained for a number of years a wonderfully successful opposition to the forces of the great monarchy. The *War of the Cevennes* (q.v.), or *Camisard War*, was not terminated till 1706, the suppression of the local rebellion being attended with circumstances of great cruelty. France had lost by this time more than a million of her most active, enterprising, and industrious citizens and, notwithstanding all the persecutions, about two millions continued to adhere to the Protestant religion.

The partial repose which the Protestants enjoyed for more than ten years was attended by a revival of their worship, especially in Provence and Dauphiné. In 1724, therefore, Louis XV., at the instigation of the Jesuits, issued a severe edict against them. The spirit of the age, however, now began to be opposed to persecution. An edict of 1752 declared marriages and baptisms by Protestant ministers to be null, and required the repetition of them by the Roman Catholic clergy. But when, upon this, many began again to flee from their country, the disgust of the Roman Catholics themselves was so much excited, that the court recalled the edict. Montesquieu successfully advocated the cause of toleration; Voltaire did much to promote it by his exposure of the judicial murder of John Calas (q.v.). At last, by an edict in 1787, which indeed, was not registered by the parliament till 1789, Louis XVI. declared the Protestant marriages and baptisms to be valid, and restored to the Protestants equal civil rights, except that they might not be advanced to public offices and dignities. Even in 1789 a proposal for the complete emancipation of the Protestants was rejected by the national assembly, which, however, admitted Protestants, and even Protestant preachers as members without objection; and in 1790, it passed a decree for the restitution of all the properties of non-Catholics confiscated since the time of Louis XIV. The *Code Napoleon* gave Protestants in France equal civil and political rights with Roman Catholics. The charter granted by the Bourbons acknowledged the freedom of Protestant worship, and the state pledged itself for the maintenance of the pastors; yet, under the government of the restoration, the privileges of Protestants were in many ways circumscribed. After the revolution of July, 1830, the reformed charter of France proclaimed universal freedom of conscience and of worship, which principle has been maintained in subsequent changes. Protestants are not now subjected to many exceptional hardships, and have in various important instances been protected by the imperial authority from the arbitrary exercise of power attempted by illiberal local magistrates adverse to their religion. But the *recognized* Protestant church—in which are included both *Reformed* and *Lutherans*, and of which the pastors receive small salaries from the state (see FRANCE)—was not till 1872 permitted to hold synods or general assemblies; at a synod held in that year the conservative party in the church, in spite of some opposition, carried their proposal that the church, which had long been without a formally binding creed, should adopt an evangelical confession. See Félice, *Hist. des Protestants en France* (1851); Haag, *La France Protestante* (1859); Smiles, *The Huguenots in England* (1873).

HUILE DE CADE, a brownish, inflammable, oily liquid, obtained by the dry distillation of the wood of *juniperus oxycedrus*. It has a strong odor of tar, and an acrid, caustic taste. It is employed externally in veterinary medicine, and also for the human subject. It is a good local remedy in toothache. It has been given internally in worms, but is a dangerous and uncertain remedy.

HUL'DA, or **HOLDA**, "the friendly, the benignant," well known in old German legends and traditions as *Frau Holle*, was originally a goddess of marriage and fecundity. Worshiped and invoked by maids and wives, to the former she sent bridegrooms, to the latter, children; great numbers of whom surrounded her in her favorite haunts in the depths of the sea, or the hearts of hills. She was also the patroness of agriculture and domestic life, with its manifold employments. Sometimes she was regarded as a celestial being, and long ago the people used to say when the snow fell: "Hulda is making her bed."

HULIN, or HULLIN, PIERRE AUGUSTIN, 1758–1841; b. Paris; entered the French army at 13 years of age, and was a sergeant at the opening of the revolution. He was on the side of the people, and was distinguished for bravery and humanity at the taking of the Bastile. He was imprisoned during Robespierre's rule, but released on the death of the tyrant. Thenceforward he was an officer under Bonaparte, and in 1844 became general of division. He was president of the court that condemned the duke d'Enghien to death, a circumstance that he deemed necessary, many years afterwards, to explain in an elaborate work.

HULK, a name given to any old ship unfit for sea-service, which is used in harbor as a depôt of some sort. In the great naval harbors, there are coal-hulks, powder-hulks, convict-hulks, and hulks to which the crews of vessels repairing are turned over.

HULL. The hull of a ship is her main body, exclusive of masts or rigging.

HULL, or KINGSTON-ON-HULL, an important and flourishing English river-port, a parliamentary and municipal borough and co. of itself, is situated in the East Riding of Yorkshire, in a low, level plain on the northern bank of the Humber, at the confluence of the Hull with that river, 53 m. e.s.e. of York. Of the ecclesiastical edifices, the most notable are the church of the Holy Trinity, a beautiful and ornate Gothic structure, the transept of which is the oldest English brick-building in the country; and St. Mary's church, Lowgate, one-half of which was removed to make room for the mansion-house of Henry VIII., who occasionally resided here. The most important educational establishments are the Hull grammar-school, and Trinity house school, where 36 boys receive a nautical education. An equestrian statue of William III. stands in the market-place, and a statue of Wilberforce. Among many other benevolent establishments, the Trinity house, instituted for the relief of decayed seamen, and the Charter house, an endowed institution for the poor, are the most worthy of note. A prettily laid-out people's park was presented to the town in 1860 by sir P. C. Pearson, then mayor. A town-hall, a new exchange, and a new theatre were all opened in 1866. A spacious borough jail was built during 1866–1868.

The docks—the Old dock, the Humber, the Junction, the Railway, and the Victoria docks—are very extensive, the last named being the largest. It occupies part of the site of an old citadel with a battery of 21 guns, which till 1864 commanded the entrance of Hull roads and the Humber. A new dock which greatly increases the accommodation for shipping was opened in 1869. Hull was one of the first ports in England to engage in the whale-fishery, an enterprise which it has now almost abandoned; but its fisheries for edible fish employ nearly 700 boats. Hull is a principal steam-packet station, and ocean steamers ply regularly to many of the principal ports of Belgium, the Netherlands, and Denmark. It is the great outlet for the woolen and cotton goods of the midland counties, with which it has direct communication, by means of railway, river, or canal. Many ship-building yards are in operation here, and the chief manufactures are those principally to which a flourishing port gives rise, as ropes, canvas, chain, chain-cables, machinery, etc. Many mills of various kinds are here carried on, as well as chemical factories, tanneries, potteries, and sugar-refineries. Immense commercial intercourse subsists between Hull and the countries of northern Europe, the principal exports being woolen and cotton manufactured goods, and the imports timber, corn, wool, iron, flax, hemp, tallow, hides, pitch, bones, and horn. In 1875, 8,986 vessels, of 3,070,598 tonnage, entered and cleared the port. Hull returns 2 members to parliament. Pop. '71, 123,408. Constituency, 19,012, including 1298 freemen.

HULL, HOPE, 1763–1818; b. Md., the son of an Englishman. He removed to Georgia near the close of the century, and was one of the chief founders of the Methodist denomination in that state.

HULL, ISAAC, 1775–1843; b. Conn. In early life he was a seaman in the merchant service. He was made a lieut. in the U. S. navy in 1798, and in 1800 was first lieut. on the frigate Congress. He served with credit in the war with Tripoli, and became a capt. in 1806. His greatest fame was won in the second war with Great Britain in the capture of the British frigate *Guerrière* by the U. S. frigate *Constitution* under his command. This was the first and the most famous naval victory of the war. After peace Hull commanded the U. S. squadrons in the Pacific and the Mediterranean, and was one of the board of naval commissioners.

HULL, WILLIAM, 1753–1825; b. Conn., graduated at Yale, and practiced law. In the revolutionary army he served with some note, being in the battles of White Plains, Trenton, Stillwater, Princeton, Saratoga, and Monmouth. For his bravery in one instance he was thanked by congress. He became a member of the Massachusetts state senate. In 1805 Jefferson appointed him governor of Michigan territory, and in 1812 he was put in command of the army of the north-west. Under a combination of unfavorable circumstances he surrendered Detroit to the British. For this he was court-martialed and sentenced to death, but was reprieved by Madison in consideration of his age and former good services. Ten years afterwards he published an elaborate defense of his act. Later writers have fully vindicated his reputation.

HULLAH, JOHN, b. England, 1812; a teacher of music, coming first before the public in the score for Dickens's *Village Coquettes*. He has been professor of vocal music and harmony in King's college, and several other institutions, and conductor of the orchestra and chorus in the royal academy of music. In 1872 he was appointed musical instructor for the United Kingdom. Among his works are a *Grammar of Harmony;* a *Grammar of Counterpoint;* a *History of Modern Music;* and *The Transition Period of Musical History.*

HULSEAN LECTURES, etc. The Rev. John Hulse, of Elworth, in the co. of Chester, was b. at Middlewich, in 1708, and was educated at St. John's college, Cambridge. Having no children, he bequeathed the bulk of his property to the university. His will, an extraordinary document, containing 400 pages folio, of closely-written manuscript, with nine codicils appended, provides for the founding of two divinity scholarships in St. John's college, the Hulsean prize, the office of Christian advocate, and that of Hulsean lecturer or Christian preacher. By a statute confirmed by the queen in council in 1860, the office of Christian advocate was changed into a professorship, called the Hulsean professorship of divinity. Bishop Ellicot was the first professor under the new statute. The office of Hulsean lecturer, or preacher, is an annual one; and the duty of the lecturer is to preach not less than four, nor more than six sermons before the university in the course of the year.

HU'MANISTS (Lat. *literæ humaniores*, polite letters), the name assumed in the beginning of the 16th c. by the party who devoted themselves specially to the cultivation of classical literature, and who, as not unfrequently happens in the enthusiasm of a new pursuit, arrayed themselves in opposition to the received system of the schools, not alone in the study of the classical languages, but even in philosophy, and eventually in theology.

HUMANITA'RIANS, the name assigned to the several classes of anti-Trinitarians, who regard Christ as a mere man, and refuse to ascribe to him any supernatural character, whether of origin or of nature. In this class are commonly enumerated the early Judaizing sects of Ebion and Cerinthus; but this is by no means certain, at least as regards the former, who taught that at the baptism in the Jordan the Demiurge descended upon Christ, and was united to him. The earliest recorded author of the purely Humanitarian theory is Theodotus of Byzantium, surnamed the Currier, who, having denied Christ in time of persecution, defended himself afterwards by declaring that in so doing "he had denied not God, but man." A contemporary of Theodotus, Artemon, taught in like manner that Christ was a mere man, and asserted that such had been the universal belief of Christians till the time of Zephyrinus, 202. These opinions must be carefully distinguished from the doctrines of the various sects of Arians, even the lowest schools of which have admitted the pre-existence of Christ, and his pre-eminence among the creatures of God.

The name Humanitarian is also sometimes applied to the disciples of St. Simon, and in general to those who look to the perfectibility of human nature as their great moral and social dogma, and ignore altogether the dependence of man upon supernatural aid, believing in the all-sufficiency of his own innate powers.

HUMANITIES, from the Latin *humanitas*, denoting refinement of taste, mental culture; called also *humanity studies*, and include grammar, rhetoric, poetry, Greek and Latin, in distinction from natural and mathematical sciences.

HUMBER, the continuation and estuary of the river Ouse (q.v.).

HUMBERT IV., b. 1844; King of Italy, eldest son of Victor Emmanuel. At an early age he obtained an insight into political and military life under the guidance of his father, whom he attended during the war of Italian independence, although he was then too young to take an active part in the struggle. The youthful heir to the throne was more closely connected with the movement for the unification of Italy, which followed the events of 1859. In particular he took part in the work of reorganizing the ancient kingdom of the two Sicilies, and in July, 1862, he visited Naples and Palermo, where he shared the popularity of Garibaldi. When the war between Prussia and Austria was imminent, prince Humbert was dispatched to Paris to ascertain the sentiments of the French government in reference to the alliance between Italy and Prussia. On the outbreak of hostilities he hastened to take the field; obtained the command of a division of gen. Cialdini's army with the title of lieut.gen.; and took a gallant part in the disastrous battle of Custozza, June 23, 1866. On April 22, 1868, he married, at Turin, his cousin, the princess Marguerite Marie Thérèse Jeanne of Savoy, daughter of the duke Ferdinand of Genoa, brother of king Victor Emmanuel. This union resulted in the birth of a son at Naples, Nov. 11, 1869, who received the names of Victor Emmanuel Ferdinand Mary Januarius, and the title of prince of Naples. After the seizure of Rome by the Italian troops in 1870, prince Humbert took up his residence there. He succeeded to the throne on the death of his father, Jan. 9, 1878. As he was entering Naples, Nov. 17, 1878, a man named Giovanni Passanante approached his carriage and attempted to assassinate him with a poniard, but the king escaped with a slight scratch. Signor Cairoli, however, the prime-minister, who was with him, was seriously wounded.

HUMBLE-BEE, *Bombus*, a genus of *social* bees (see BEE), having a thick and very hairy body, the hairs often arranged in colored bands; and also differing from the honey-bees in having the tibiæ of the hinder-legs terminated by two spines. The species are numerous, and are found in almost all parts of the world, from the equator to the utmost polar limits of vegetation, but they seem to abound most of all in temperate climates. About forty are natives of Britain, one of the largest of which, and of British hymenopterous insects, is the common humble-bee (*B. terrestris*), the *bumbee* (boom-bee) of the Scotch; black, with a yellow ring before the wings, and another on the abdomen, the apex of the abdomen white. Another of the largest species is the RED-TAILED BEE (*B. lapidarius*), and one of the most abundant is the yellow and orange MOSS-BEE (*B. muscorum*), the *foggie* of the Scotch. Some of the tropical species are much larger than any found in Britain. The name humble-bee is supposed to be a modification of *hummel* or *hummer bee*, and to refer to the loud hum produced by the wings of these insects.

Humble-bees do not form communities so large as those of honey-bees; seldom more than two or three hundred occupying one nest, and in some species not more than fifty or sixty. The females are much less prolific than those of honey-bees. The community is dissolved on the approach of winter, the males and workers die, and only females remain in a torpid state—among moss, in rotten wood, or in some other situation where they may enjoy protection from frost, and concealment from enemies—to perpetuate the race by founding new communities in the ensuing spring. The nests of some species, as *B. terrestris*, are in holes in the ground, at the depth of a foot or more, floored with leaves, and lined with wax, and often entered by a winding passage. Others, as *B. lapidarius*, make their waxen nests among stones; while others still, as *B. muscorum*, make them among moss, which they mix and join with wax. The nests are enlarged as the community increases. Some of the eggs are deposited in balls of mingled pollen and honey, on which the larvæ feed, one ball containing several larvæ; afterwards, eggs are also deposited in waxen cells. Workers are chiefly produced in the earlier part of the season, males and perfect females in the latter part of it. The females are larger than the males and workers. Humble-bees differ from honey-bees in their females existing together in the same community without seeking to destroy one another. There is among them nothing analogous to swarming. Their combs do not exhibit the beautiful regularity of structure which characterizes those of honey-bees; but cells of a comparatively coarse appearance are clustered together, with silken cocoons of pupæ, balls of the kind already noticed, and open cells or pots filled with honey, the frequent prize of schoolboys and youthful haymakers, who know well how to open and plunder the humble-bee's nest. Many animals are also expert in this, as badgers, foxes, rats, etc., which, however, devour the brood as well as the honey.

HUM'BOLDT, a river in the w. part of Utah territory, United States, formed by the union of two streams which rise on the w. side of the Humboldt mountains. It is a small and rapid stream, 350 m. in length, unnavigable even for canoes, strongly impregnated with alkaline matter, and after a westerly course, falls into a lake 40 m. in circumference, known as the Sink of Humboldt's river, which has no outlet. The banks are destitute of trees or shrubs, and the region through which it flows is one of the most barren in Utah. The Pacific railroad, traversing the United States from e. to w., runs through the valley of the Humboldt.

HUMBOLDT, a co. in n.w. California, bordering on the ocean, and intersected by Mad and Eel rivers; 2,800 sq.m.; pop. '70, 6,140. It is mountainous, with fertile valleys and rolling prairie, and is in a large degree covered with timber. Lumber is the main article of export. The immense red-wood trees are a feature of the region. Co. seat, Eureka.

HUMBOLDT, a co. in n.w. Iowa, on the forks of Des Moines river; 432 sq.m.; pop. '70, 2,596. The surface is mostly level and the soil fertile; chief productions: corn, hay, and oats. Co. seat, Dakotah.

HUMBOLDT, a co. in n.w. Nevada, on the Oregon border; intersected by Humboldt river; 19,000 sq.m.; pop. '75, 2,437. The surface is mountainous and unfruitful; water and timber are scarce. Copper, lead, and silver are found. Co. seat, Winnemucca.

HUMBOLDT, FRIEDRICH HEINRICH ALEXANDER, Baron von, one of the greatest of naturalists, and who has contributed more than any man of modern times to the progress of several departments of physical science, was b. at Berlin, Sept. 14, 1769. His father, whom he lost when he was not quite ten years of age, was chamberlain to the king of Prussia. He studied at the universities of Frankfort-on-the-Oder, Berlin, and Göttingen. His love of natural history was very strongly manifested at this period; and during his residence at Göttingen (1789–90), he made visits of scientific exploration to the Harz and the banks of the Rhine, the fruit of which was his first publication, *On the Basalts of the Rhine*, etc. In the spring and summer of 1790, he accompanied George Forster in a tour through Belgium, Holland, England, and France. In June, 1791, he entered the mining academy at Freiberg, where he enjoyed the private instructions of Werner. His eight months' residence here led to the subsequent publication of his *Flora Subterranea Fribergensis et Aphorismi ex Physiologia Chemica Plantarum* (Berlin, 1793). He was afterwards appointed to an office in the mining department, and spent some years in this

capacity, chiefly at the Fichtelgebirge, in Upper Franconia. His researches here resulted in a work *On the Irritability of the Muscular and Nervous Fibers, with Conjectures regarding the Chemical Process of Life in the Animal and Vegetable World* (*Ueber die Gereizte*, etc., 2 vols., Berlin, 1797–99).

The desire of visiting tropical countries, however, led him to resign his office, and devote himself entirely to the study of nature. He spent three months at Jena, where he was the intimate associate of Goethe and Schiller, and studied anatomy under Loder. Circumstances now led him to Paris, where he contracted a friendship with a distinguished young botanist, Aimé Bonpland (q.v.), afterwards his companion in many and various scenes. Some time after, he obtained permission from the Spanish government to visit all the Spanish settlements in America and the Indian ocean, with every additional favor which could promote his researches in the various departments of natural science. He sailed from Corunna along with Bonpland, on June 5, 1799. They visited Teneriffe, ascended the peak, and made many scientific observations. On July 16 they arrived at Cumana in South America, and in the course of five years explored a vast extent of territory in Venezuela, Granada, Ecuador, and Peru, whence they sailed for Mexico, which they crossed from w. to east. On March 7, 1804, Humboldt sailed from Vera Cruz for Havana, where he spent two months, completing the preparation of materials afterwards employed in his *Essai Politique sur l'Isle de Cuba* (Paris, 1826). From Havana he proceeded by sea to Philadelphia, and thence to Bordeaux, where he arrived after a course of travels unparalleled for variety and importance of scientific results, not only in the different departments of natural history, but also in geography, statistics, and ethnography.

Humboldt resided in Paris till March, 1805, occupied in the arrangement of his collections and manuscripts, and jointly with Gay-Lussac in experiments on the chemical constitution of the atmosphere. Having visited Italy, and returned to Berlin, he accompanied prince Wilhelm of Prussia in 1807 on a political mission to France, and obtained leave from the government of his own country to remain there, for the publication of his travels, for which the disturbed state of Germany at that time did not allow proper opportunity. He continued to reside in Paris till 1827. In 1807–17, his great work, embodying the chief results of his travels, appeared in two forms, folio and quarto, in each consisting of 29 volumes, and containing 1425 copper-plates. The wish of the king that he should reside in his native country was gratified in 1827, when he proceeded to Berlin, and there, in the winter of 1827–28, he gave lectures on the *Cosmos*, or physical universe.

In 1829 Humboldt again became a traveler, the emperor Nicholas then sending out a well-appointed expedition to the n. of Asia, to explore the Ural and Altai mountains, the Chinese Dsongarei, and the Caspian sea. In this expedition Humboldt was accompanied by his two friends, Ehrenberg and Gustavus Rose. Its principal results were the scientific examination of the beds which produce gold and platina, the discovery of diamonds in an extra-tropical region, the astronomical determination of positions, magnetic observations, and geological and botanical collections. The whole journey occupied nine months, and extended to 2,320 miles. It is described in Rose's *Mineralogical and Geological Travels to the Ural, the Altai, and the Caspian Sea* (*Mineralogisch-geognostischer Reise*, etc., 2 vols., Berlin, 1837–42); and in Humboldt's *Asie Centrale, Recherches sur les Chaines de Montagnes et la Climatologie comparée* (3 vols., Paris, 1843). This expedition must be regarded as having also led to much increase of our knowledge of the earth's magnetism, through the adoption by the emperor of Russia of Humboldt's proposal for the establishment of magnetic and meteorological stations from Petersburg to Pekin; which was followed, on Humboldt's application to the duke of Sussex, by the establishment of similar stations in the southern hemisphere.

The political changes of the year 1830 led to Humboldt's employment in political services. He had been long on friendly terms with the members of the house of Orleans, and therefore, after Louis Philippe ascended the French throne, he was chosen by the king of Prussia to carry to Paris his recognition of the new sovereign, and was afterwards, during the ensuing twelve years, frequently sent to Paris to reside for four or five months. He accompanied the king of Prussia also in visits to England, Denmark, etc. During this time, he published his *Examen Critique de la Géographie du Nouveau Continent* (5 vols., Par. 1835–38).

Humboldt spent the latter years of his long life at Berlin, where he occupied a high position at the Prussian court. His last great work, *Cosmos* (4 vols., Stuttg. 1845–58), has been unanimously recognized as one of the greatest scientific works ever published, exhibiting in most lucid arrangement many of the principal facts of the physical sciences, and their relations to each other. It has been translated into all the languages in which a book of science is required. The germ of the work was the author's *Views of Nature* (*Ansichten der Natur*, Stuttg. 1808). Humboldt died May 6, 1859.

It is not easy to estimate the amount of Humboldt's contributions to science. The geography of Spanish America was most imperfectly known previous to his travels there, during which he astronomically determined more than 700 positions, and he bestowed much labor on the preparation of the maps in which his discoveries were exhibited. His barometrical observations were likewise very numerous, as well as his observations on all points connected with meteorology. To him we are indebted for the most important

generalizations concerning magnetism and also climate, some results of which are exhibited in the isothermal and other lines which have begun to be drawn in our maps.

Among his botanical works, that on the geography of plants, *De Distributione Geographicâ Plantarum secundum Cœli Temperiem et Altitudinem Montium* (Paris, 1817), must be reckoned the most important. It was preceded by an *Essai sur la Géographie des Plantes* (Paris, 1805). The botanical discoveries made by himself and Bonpland in their American travels were given to the world in a number of works by Humboldt and Kunth, published at Paris from 1809 to 1834. He gave to the world also his observations, many of them most valuable, which were made at the same time, in zoology and comparative anatomy; and in a magnificent volume, *Vues des Cordillères et Monuments des Peuples Indigènes de l'Amerique*, he directed the attention of Europe to the monuments of a little known antiquity in America, and showed for the first time the possibility of combining artistic beauty with scientific accuracy. He published in 1823 an *Essai Geognostique sur le Gisement des Roches dans les deux Hemisphères* (Paris); and in 1831, *Fragments de Géologie et Climatologie Asiatique* (2 vols., Paris). In 1811 he produced a work on political economy, *Essai Politique sur le Royaume de la Nouvelle Espagne* (2 vols.). He obtained distinction also by his labors in the determination of the magnetic equator, and by his observations on electrical eels, and on the respiration of fishes and young crocodiles. See the great biographical work, edited by Bruhns, *Alexander von Humboldt, Eine wissenschaftliche Biographie* (1872; Eng. transl., 1872).

HUMBOLDT, KARL WILHELM, Baron von, the elder brother of the preceding, eminent as a statesman, and for his works in philology, æsthetics, and general literature, was b. at Potsdam, June 22, 1767, and educated at Berlin, Frankfort-on-the-Oder, and Göttingen. He eagerly studied antiquities, æsthetics, and the Kantian philosophy, as well as law, to which he professedly devoted himself. After traveling in Germany, France, and Switzerland, he acquired the rank of counselor of legation, but showed little inclination for official employment, and in 1791 married, and for some years resided chiefly on his wife's estate in Thuringia, and afterwards in Jena, associating most intimately with Schiller, and devoting himself to poetry and other literary and scientific pursuits. A valuable memorial of his friendship with Schiller is the correspondence between them (*Briefwechsel zwischen Schiller und Wilhelm von Humboldt*, Stuttg. und Tüb., 1830), published by him after Schiller's death. From 1797 to 1799 Humboldt resided partly in Paris and partly in Spain, and in 1801 became Prussian resident at Rome, where he remained for a number of years, in this capacity, and in that of minister-plenipotentiary, a most generous patron of young artists and men of science. From Rome he returned to his native country, to fill the high place of first minister of public instruction, in which capacity he did much to promote education in Prussia. The Berlin university owed its existence to him. In 1810 he went to Vienna as minister-plenipotentiary, and from this time he took part in all the most important political affairs in which his country was concerned. After 1819 he resided chiefly at Tegel, where he laid out fine pleasure-grounds, and formed a noble collection of sculptures by the greatest masters. He died April 8, 1835.

His earliest literary works were collected by himself under the title of *Æsthetic Essays* (*Æsthetische Versuche*, Brunswick, 1799). His *Collected Works* appeared at Berlin (7 vols. 1841–52). Humboldt devoted himself with the greatest eagerness and assiduity to the study of philology, and produced several works on the Basque tongue, and the evidence which it affords concerning the aboriginal inhabitants of Spain—the languages of the east, and various questions connected with oriental literature, and the languages of the South sea islands. One of his most important works is that *On the Kawi Language in the Island of Java* (*Ueber die Kawisprache*, etc., 3 vols., Berlin, 1836–40), published after his death by Edward Buschmann; the introduction to which, *On the Variety of Structure in Human Speech*, etc., and its influence on the intellectual progress of mankind, may be said to mark a new era in the science of philology, and has given occasion to many further researches and publications. *Wilhelm von Humboldt's Briefe an eine Freundin* ("Letters to a Lady Friend," 1847; Eng. transl., 1849), exhibit his character in a most pure and amiable light. See the admirable biography by Haym (1856).

HUME, DAVID, the philosopher and historian, was b. at Edinburgh on April 26, (O. S.) 1711. His father was the laird or proprietor of the estate of Ninewells in Berwickshire, but David being the youngest son had to make his own fortune with no other assistance than an education and the influence of his respectable family. He was educated at home and at the college of Edinburgh. His father designed law as his profession and he submitted to the initial steps of the proper practical training, but it was not a pursuit to his liking. Deserting it he experimented on a mercantile house in Bristol, but commerce was not more congenial to him than jurisprudence and he gave it a very short trial. He now became a musty student, devoting himself to books with no settled practical object before him. He has recorded his sufferings at this time from despondency and depression of spirits, caused apparently by the effects of monotonous study on the stomach. At 23 years of age he went to France and lived some time in La Fleche, where he describes himself as wandering about in solitude and dreaming the dream of his philosophy. In 1739 he published the first and second book of his *Treatise on Human Nature*—the germ of his philosophy and still perhaps the best exposition of

it, since it has there a freshness and decision approaching to paradox, which he modified in his later works. Although the dawn of a new era in philosophy, this book was little noticed. It was a work of demolition. By separating the impressions or ideas created on the thinking mind by an external world from the absolute existence of that world itself, he showed that almost everything concerning the latter was taken for granted, and he demanded proof of its existence of a kind not yet afforded. It was thus that he set a whole army of philosophers at work, either to refute what he had said or seriously to fill up the blanks which he discovered, and hence he originated both the Scotch and the German school of metaphysicians. In 1741 and 1742 he published two small volumes called *Essays Moral and Political;* they were marked by learning and thought and elegantly written, but are not among the more remarkable of his works. He felt keenly at this time the want of some fixed lucrative pursuit, and his longing for independence was the cause of a sad interruption to his studious and philosophical pursuits. He was induced to become the companion or guardian of an insane nobleman and had to mix with the jealousies and mercenary objects of those who naturally gather round such a center. In 1747 he obtained a rather more congenial appointment as secretary to gen. St. Clair, whom he accompanied in the expedition to the coast of France and the attack on port L'Orient, the depôt of the French East India company; this affair had no important results, but it gave Hume a notion of actual warfare. Next year he accompanied the gen. in a diplomatic mission to France, and as he traveled he took notes of his impressions of Holland, Germany, and Italy, which are published in his *Life and Correspondence.* In 1751 he published his *Inquiry into the Principles of Morals,* a work of great originality and one of the clearest expositions of the leading principles of what is termed the utilitarian system. At the same time he intended to publish his *Dialogues concerning Natural Religion,* but his friends, alarmed by the skeptical spirit pervading them, prevailed on him to lay them aside, and they were not made public till after his death. In his 35th year he had unsuccessfully competed for the chair of moral philosophy in Edinburgh, and at this period we find him unsuccessful in an attempt to obtain the chair of logic in Glasgow. Next year, in 1752, appeared his *Political Discourses.* Here again he made an era in literature, for in this little work he announced those principles of political economy comprehending the doctrine of free-trade, which it fell to his friend Adam Smith more fully and comprehensively to develop. He was appointed at this time keeper of the advocates' library with a very small salary, which he devoted to a charitable purpose. It was here that, surrounded with books, he formed the design of writing the history of England. In 1754 he issued a quarto volume of the *History of the Stuarts, containing the Reigns of James I. and Charles I.,* and presently completed this portion of the work in a second volume, bringing it down to the revolution. He then went backwards through the house of Tudor, and completed the work from the Roman period downwards in 1762. While so employed he published *Four Dissertations: the Natural History of Religion; of the Passions; of Tragedy; of the Standard of Taste* (1757). Two other dissertations intended to accompany these were canceled by him after they were printed—they are *On Suicide* and *The Immortality of the Soul,* and were subsequently printed in his works

In 1763 he went to France as secretary to lord Hertford's embassy; here he was in his element, and found fame at last. He became familiar with the brilliant wits and savants of the Parisian circle—with Turgot, D'Alembert, Helvetius, Holbach, Diderot, Buffon, Malesherbes, Crebillon, and the rest, as well as with the no less distinguished female eminences, De Boufflers, Page de Boccage, Geofrin, Du Deffand, and L'Espinasse. His sojourn in Paris was unfortunate in bringing him into intimacy with the restless, vain, and self-tormenting Rousseau, who, after experiencing much substantial kindness from Hume, got suspicious and forced him into a memorable quarrel. After his return home in 1766 he accepted the responsible office of under-secretary of state for she home department. In his own life he says: "I returned to Edinburgh in 1769 very opulent (for I possessed a revenue of £1000 a year), healthy and though somewhat stricken in years, with the prospect of enjoying long my ease and of seeing the increase of my reputation." His health gave way in 1674, and he died at Edinburgh Aug. 25, 1776. See Hume's *Life* by J. H. Burton (1850), and the admirable edition of his works by T. H. Green and T. H. Grosse (4 vols., 1875).

HUME, JOSEPH, politician, was b. Jan., 1777, at Montrose. His father was the master of a small coasting-vessel, who, dying while his family were young, left his widow and children in narrow circumstances. He was educated in the local schools of Montrose, and at the age of 13 was placed with an apothecary. He studied for the medical profession; was admitted in 1796 a member of the college of surgeons, Edinburgh; and became assistant-surgeon in the marine service of the East India company. He applied himself to the acquisition of the native languages, and during the Mahratta war, from 1802 to 1807, filled the office of Persian interpreter to the army. He also discharged duties connected with the prize agencies and the commissariat, and arrived in England, in 1808, with an honestly earned fortune of £30,000 or £40,000. He entered the house of commons in 1812, as M.P. for the borough of Weymouth and Melcombe Regis. The future radical was then of tory politics, and paid a sum of money for his seat, which he only enjoyed a few months. He obtained, in 1818, a seat for the Aberdeen district

of burghs, comprehending his native town of Montrose. In 1830 he had gained such distinction as a radical reformer, that he was returned without opposition as one of the members for Middlesex, which he represented until 1837. In 1842 he was again chosen for his native burgh, Montrose, and remained until his death in the service of his fellow-townsmen. Although by no means a man of brilliant abilities, his indefatigable industry in his parliamentary duties, his plans of reform in every department of church and state, his hatred of sinecures and official abuses of every kind, and his advocacy of economy in the public service, made him one of the most useful and influential members of the legislature. He was probably often wrong-headed and mistaken, and as the leader of the radical party in the house of commons, usually found himself in active conflict with both whig and tory governments. Yet a tardy but sincere homage was paid to his integrity and public services by the late sir Robert Peel, and other political opponents. He died Feb. 20, 1855, aged 78, leaving a name venerated by his fellow-countrymen for public honesty and personal disinterestedness.

HUMERUS, the largest and longest bone of the upper extremity. It is the one bone of the arm proper, that is, that portion between the shoulder and elbow. It is divided anatomically into a *shaft* and two *extremities*. The upper extremity is rather the largest, and has a semi-globular head which is received (partially, because the cavity is shallow) into the *glenoid* cavity of the scapula or shoulder blade, forming what is called a ball and socket joint. Two processes or projections of the shoulder blade assist the glenoid cavity in completing the cavity or seat of the head of the humerus. There are three ligaments which hold the humerus to the scapula: the capsular, the coraco-humeral, and the glenoid, the relations being somewhat similar to what obtain in the hip joint (q.v.). The shaft of the humerus is nearly cylindrical in its upper part, but triangularly prismatic below, becoming flattened and broad at the lower extremity, where are placed the two condyles, with their articular surfaces, and the trochlea between them, which form, with the two bones of the fore-arm, the elbow joint (see ARM and SKELETON). The broad, flat lower extremity has two depressions on the anterior aspect of the bone: one slight one on the outer side called the radial depression, which is for the reception of the anterior border of the head of the radius, when the arm is strongly flexed; the other, called the coronoid depression, for the reception of the coronoid process of the ulna during flexion of the arm. Opposite these depressions, on the posterior surface of the bone, is a deep triangular depression, called the olecranon fossa, for the reception of the important process of the ulna, called the olecranon process. The humerus forms with the scapula, as above-mentioned, a ball and socket joint, the shoulder joint (q.v.). The elbow joint is a hinge joint, and, to a certain extent, in its relation to the head of the radius, a ball and socket joint, and is one of the most beautiful pieces of mechanism which can be conceived, especially in man, where it exhibits indications of design having reference to man's intellectual functions.

HUMET'TY, a term in heraldry, applied to a cross or other ordinary which is cut off, and nowhere reaches the edge of the shield.

HUMIC ACID. See HUMUS.

HUMILIATI, a monastic order founded in 1134 by several Italian noblemen who had been sent as prisoners to Germany by Lothar II., and were released on account of their *humility*. In 1151 they were embraced under the rule of St. Benedict, and the order was confirmed by Innocent III. half a century later. They ultimately spread so widely as to have 98 houses under the jurisdiction of their order; but they were suppressed by Pius V. in 1576 on account of their luxury and cruelty. A female order of Benedictines, known as humiliate nuns, or nuns of Blassoni, from their foundress, served as nurses, etc. In 1571 they were suppressed by the pope on account of some disorders, but a few convents, greatly decayed, still exist in Italy.

HUMMEL, JOHANN NEPOMUK, an eminent pianist and composer, b. at Presburg in 1778. His earliest musical instructions were derived from his father, the director of the imperial school of military music; after which he went to Vienna, where Mozart, forming a high opinion of his talents, took him under his tuition. He appeared in public in 1787, being then but nine years of age, at a concert given by Mozart in Dresden; after which he gave concerts in Germany, Denmark, England, and Holland. In London, Hummel had the advantage of Clementi's instructions in 1791; and in Vienna, in 1793, he took lessons from Albrechtsberger, in composition, and from Salieri in dramatic writing. From 1803 to 1811, he held the post of kapellmeister to prince Nicholas Esterhazy; and he was at a later period kapellmeister at Stuttgart and Weimar. He visited Paris for the first time in 1822: and in 1833 became conductor of the German opera at the King's theater in London. He died at Weimar in 1837. Hummel's pianoforte works rank among the purest and most classical compositions for that instrument —his concertos are full of artistic skill; he has besides composed masses, which are in high esteem, and several now nearly forgotten operas and cantatas. His playing was characterized by the same solid qualities as appear in his compositions.

HUM'MELER, an implement or machine used for *hummeling* barley—that is, removing the awn from the grain after it has been thrashed. A common kind of hummeler is a set of blunt knives fixed in a frame, with a handle, by means of which they are

used in the manner of stamping. Another form consists of blunt knives set on a roller. These implements are worked by the hand. But hummelers of various construction are often attached to thrashing-machines, in all of which blunt knives are made to pass frequently through the grain.

HUMMING-BIRD, *Trochilus*, a Linnæan genus of birds, now constituting a family, *trochilidæ*, of the order *insessores*, and tribe *tenuirostres*. The species are numerous, more than 300 being known, whilst new ones are continually being discovered. They are found only in America and its islands, although represented, both in habits and in brilliancy of plumage, by the sun-birds (q.v.) of eastern tropical regions. Most of them are tropical, although a few species are summer visitants of the colder parts of America, very seldom, however, seen beyond lat. 57° n.; whilst some of those found only within the tropics inhabit elevated mountainous tracts, even to the confines of perpetual snow. The dazzling brilliancy of humming-birds, the extreme rapidity with which they dart through the air, their hovering above the flowers from which they obtain their food, with humming sound of wings which move so quickly as to be indistinctly visible, or "like a mist," have attracted universal admiration since the first discovery of America. The diminutive size of almost all of them—some of them being the smallest of birds, and if stripped of their feathers, not larger than a humble-bee—has still further contributed to render them objects of interest, whilst the plumage of the different species exhibits an almost endless variety of forms as well as of colors, in crests, neck-tufts, leg-tufts, and many an extraordinary development of tail.

Humming-birds have slender bills, which are also generally long, and in some extremely so, the form of the bill exhibiting a wonderful adaptation to the kind of flowers from which the bird obtains its food—straight in some, curved in others. Humming-birds do not, as was long supposed, feed on honey alone, but to a considerable extent, and some of them perhaps chiefly, on insects, not rejecting spiders, whilst they often snatch away the insects which have become entangled in spiders' webs. The lower mandible fits into the upper, and the bill is thus adapted as a tube for sucking, in which, as well as in seizing small insects within the recesses of flowers, the tongue is also a very efficient organ. The tongue is very long, capable of being darted out to a considerable length; the bone of the tongue (*hyoid bone*) being much elongated, and its branches passing round the back of the skull to the forehead, where they meet in a point before the line of the eyes. The tongue itself consists of two filaments, joined together for the greater part of their length, and separated at the tip. The wings of humming-birds are very long and powerful, the first quill-feather the longest, and the rest shorter in succession. Humming-birds construct their nests with nice art, generally of lichens and of fibrous substances, such as cotton. They do not lay more than two eggs. They are very bold in defense of their nests and young, and are said to strike fearlessly with their needle-like bills at the eyes of birds of prey, which they far surpass in agility and rapidity of flight. They are very easily tamed and rendered familiar, and have been known to return again in spring, after a winter migration to a warmer climate, to the window from which they had been allowed to escape. Attempts to keep tamed humming-birds have generally failed, perhaps on account of their being supposed capable of feeding only on honey or syrup, whereas insect food seems necessary for them. Attempts made to bring them across the Atlantic have, in the great majority of cases, been unsuccessful.

We cannot propose to describe any of the species of humming-bird, nor to give the characters of the numerous genera into which the family has been divided. Form alone without color is insufficient to convey a proper idea of their metallic and gem-like splendor, which in many cases varies with every change of position and of light.

The ruby-throated humming-bird (*trochilus colubris*) is the only species found in the northern Atlantic states of North America. It ventures even into the regions of the Hudson's bay company.

The skins of humming-birds were employed for ornamental purposes by the more civilized American races before the discovery of America by Europeans, and were used by the Mexicans for making those pictures which so much attracted the admiration of their Spanish conquerors.

One of the greatest authorities on the humming-bird is Gould, who has written a work upon the subject, magnificently illustrated.

HU'MORS. See MEDICINE.

HUMPBACK WHALE, one of the *balaenidæ*, or toothless whales, which includes the right or Greenland whale, the teeth being replaced by whalebone plates, whence they are also called *whalebone whales*. The humpback whale belongs to the genus *magaptera*. They have a hump on the back which is an adipose dorsal fin. They are very ferocious, and valued for their oil. See WHALE.

HUMPHREY, EDWARD PORTER, D.D., LL.D.; b. Conn., 1808; son of Heman; graduated at Amherst in 1832. He has been a Presbyterian pastor in Indiana and Kentucky; and professor of ecclesiastical history in Danville theological seminary.

HUMPHREY, HEMAN, D.D., 1779–1861; b. Conn.; graduated at Yale, and was pastor of a Congregational church in Fairfield for ten years; afterwards pastor in Pittsfield,

Mass. In 1823 he was chosen president of Amherst college, over which he presided until 1845, after which he turned his attention to authorship. He was an early advocate of temperance, and a report of his on the subject made in 1813 is said to have been the first temperance tract. Among his publications there are, besides biographies, *The Sabbath; Tour in France, Great Britain and Belgium; Domestic Education;* and *Revival Sketches.*

HUMPHREY, ZEPHANIAH MOORE, D.D., b. Mass., 1824; graduated at Amherst and in theology at Andover in 1849. He has had pastoral charge in Milwaukee, Chicago, and Philadelphia; he was a leading member of the last general assembly of the new school branch of the Presbyterian church, his brother being at the same time a prominent member of the old school assembly, an took an influential part in the consummation of the reunion of the two branches; and in 1871 he was moderator of the reunited assembly. In 1875 he became professor of church history in Lane theological seminary, at Cincinnati, Ohio.

HUMPHREYS, a co. in middle Tennessee crossed by the Nashville, Chattanooga, and St. Louis railroad, bounded w. by the Tennessee river; 400 sq.m.; pop. '70, 9,326—1295 colored. It has a hilly surface largely covered with forests. Corn is the chief crop. Iron is found. Co. seat, Waverly.

HUMPHREYS, ANDREW ATKINSON, b. Philadelphia, 1810; graduated at West Point and served in the U. S. army until 1836. He then resigned from the army, but in 1838 rejoined it and was assigned to the topographical department, with the direction of the coast survey office. He was also engaged in the Pacific railroad survey. In the war of the rebellion he was on McClellan's staff, and afterwards was Meade's chief of staff. He saw much active service at Fredericksburg, Chancellorsville, and Gettysburg. In 1866 he was appointed chief of engineers of the U. S. army with the rank of brig.gen.

HUMPHREYS, DAVID, LL.D., 1752–1818; b. Conn.; graduated at Yale; a captain in the revolutionary war, and aid to Washington. In 1780 he went to France with Jefferson as secretary of legation; afterwards to Lisbon, and in 1797 to Spain as ambassador. In the war of 1812 he was an officer of militia. He was one of the writers of the *Anarchiad*, a satirical work in verse published soon after the revolution. He also wrote a life of Putnam.

HU'MUS is a generic term applied to a group of closely allied substances, which collectively form the organic matter of the soil. These substances may be divided into three great classes: 1. Such as are soluble in water—crenic, apocrenic, and ulmic acids; 2. Such as are soluble in alkaline solutions, but not in pure water—humic and geic acids; 3. Such as are insoluble in all menstrua—humin and ulmin.

All of these are amorphous, ranging in color from a brownish yellow to a blackish brown; and non-volatile; they are probably all composed of carbon, hydrogen, and oxygen, and they are all remarkable for their power of fixing ammonia. "They are all products of the decomposition of vegetable matters in the soil, and are formed during their decay by a succession of changes, which may be easily traced by observing the course of events, when a piece of wood, or any other vegetable substance, is exposed for a length of time to air and moisture. It is then found gradually to disintegrate with the evolution of carbonic acid, acquiring first a brown, and finally a black color. At one particular stage of the process, it is converted into one or other of two substances, called humin and ulmin, both insoluble in alkalies, and apparently identical with the insoluble humus of the soil; but when the decomposition is more advanced, the products become soluble in alkalies, and then contain humic, ulmic, and geic acids; and finally, by a still further progress, crenic and apocrenic acids are formed, as the result of an oxidation occurring at certain periods of the decay."—Anderson's *Agricultural Chemistry*, 1860, p. 22.

The roots and other vegetable matters remaining in the soil gradually undergo the changes which have been described in the preceding extract, and are thus converted into humus, which is found only in the surface soil, in which its quantity varies with the activity and profusion of the vegetation.

Numerous analyses of the humus compounds have been made, but, as might be expected from the gradual passage of one substance into another, they present considerable discrepancies. According to Mulder, who is perhaps the highest authority on this subject, geic acid is represented by $C_{40}H_{12}O_{14}$; humic acid, by $C_{40}H_{12}O_{12}$; ulmic acid, by $C_{40}H_{14}O_{12}$; crenic acid, by $3HO,C_{24}H_{12}O_{16}$; apocrenic acid, by $2HO,C_{48}H_{12}O_{24}$. Crenic and apocrenic acids (which derive their names from *crenē*, the Greek word for *a spring*) not only occur in combination with ammonia, in the organic matter of the soil, but are likewise found in many mineral waters, and in the ochry deposits that accumulate round the margins of chalybeate springs.

All the above-named substances closely resemble in their composition the woody fiber or cellulose ($C_{24}H_{21}O_{21}$), from which they are derived by a slow process of oxidation.

Chemists hold very different opinions regarding the physiological value of humus The earlier chemists, and Mulder at the present day, regard it as the almost (if not quite) exclusive source of the organic constituents of plants; while Liebeg and the great majority of the chemists of the present day regard the atmosphere (which consists of a mixture

of nitrogen and oxygen gases, watery vapor, carbonic and nitric acids, and ammonia) as capable of affording an abundant supply of all these substances. The latter is probably the more correct view; but although humus is not a direct source of the organic constituents of plants, and is not absorbed by their roots, as was formerly supposed, it is so indirectly in at least two modes—viz., by evolving during its decomposition a certain quantity of carbonic acid which can be absorbed, and by its power of absorbing and combining with ammonia and with certain soluble inorganic constituents of plants. Its power of absorbing ammonia is readily shown by pouring some ammoniacal solution on peat (which contains the humus compounds in great abundance); the pungent smell at once disappears, which is an evidence that combination has taken place. It possesses a similar but less marked power in reference to potash, soda, lime, and magnesia, and thus plays an important part in preventing these substances from being washed out of the soil. The physical properties of humus are also of great importance in relation to the fertility of the soil. Humus is one of the most highly hygrometical substances known. While siliceous sand absorbs only one-fourth of its weight of water, and again gives off, in the course of four hours, four-fifths of its water, humus imbibes nearly twice its weight of water, and retains nine-tenths of it after four hours' exposure. It thus confers on the soil the power of absorbing and retaining water, and thus diminishes its tenacity, and allows of its being more easily worked; and additionally, from its dark color, it causes the more rapid absorption of heat from the sun's rays. Hence, although not contributing directly to the food of plants, it is in moderate quantity an indispensable constituent of a fertile soil. The best wheat-bearing soils contain 9 or 10 per cent of humus compound.

HUMU'YA, a river in Honduras, which with the Santiago and Blanco forms the Ulua. The Humuya has a course of 100 m.; is rapid and navigable only for canoes. It passes by the city of Comayagua, the capital of Honduras, and its chief interest exists in its possible connection with an interoceanic canal.

HU'NAN, a province in the lake district of China, on the s. side of Tung-ting-hu, the largest lake in China. It is a fertile region, yielding two crops of rice annually, while its mountains yield malachite, iron, lead, and coal. Area, 74,320 sq.m.; pop. 18,652,507. Its capital is Chang-sha-fu, situated on the river Siang.

HUNDRED, in English law, an ancient subdivision of counties, the origin of which is not very clearly settled, though probably the name arose from there being a hundred sureties in each to keep the peace. In ancient times, if a crime was committed, such as robbery, maiming of cattle, burning of stacks, etc., the hundred had to make it good. The old distinctions have, however, now less significance. But the characteristic of a hundred is still this, that it has a constable or bailiff, and when any damage is done by rioters feloniously destroying property, the individual owner has his remedy by suing the hundred for the damage. In order to secure this remedy, the party or his servant must, within seven days, go before a justice, and state on oath the names of the offenders, and engage to prosecute them. So, where there is no hundred, the county or city, or town is liable in like manner, and in all cases the expenses are paid by the county rate, or a rate in the nature of a county rate. In the northern counties, a hundred is generally called a wapentake. The act 7 and 8 Geo. IV. c. 31, giving the above remedy against the hundred, does not extend to Scotland. See RIOT.

HUN'DREDERS, inhabitants of a hundred (q.v.).

HUNFALVY, JÁNOS, b. Hungary, 1820; professor of statistics in the academy at Käsmark; took part in the revolution of 1848; and five years later became professor of history in the polytechnic school at Buda. He has published *Universal History; Physical Geography of Hungary; Hungary and Transylvania* and some other books.

HUNFALVY, PÁL, b. Hungary, 1810; a member of the diet, professor of jurisprudence in the academy at Käsmark, and a philologist. He has written works upon languages, particularly concerning the origin of the Hungarian tongue.

HUNGARIAN GRASS, a hardy annual, a variety of millet. It grows luxuriantly in almost any soil, and is highly esteemed for forage, being greatly relished by horses and cattle.

HUNGARIAN LANGUAGE AND LITERATURE (HUNGARY, *ante*). The origin of the language is involved in obscurity, but its vitality is remarkable. It was no doubt spoken and written by some of the tribes in middle Asia at a very early period. It is now accommodated to the Latin alphabet, and consists of 26 simple and 6 compound sounds. Whatever changes it has undergone, it yet retains all its essential features. It indeed embodies many foreign words, but it has assimilated them in accordance with its own fundamental laws. Its system of suffixes gives it great plasticity, enabling it to meet in the readiest way difficulties that other languages can only overcome in a very awkward fashion. It is capable of expressing with ease and fidelity every shade of meaning conveyed in other tongues. The literature of Hungary is of comparatively recent date, its growth having been checked by the introduction of Latin as the language of priests and teachers as well as of the court under Stephen I., who introduced the Roman religion and reigned from 997 to 1038. The remnants of Hungarian writing from this time till the Protestant reformation are very scanty. This great movement promoted the cultivation of the native tongue, but the German element coming in with

the Hapsburgs offered a new check to the development of the national literature. In the 16th c., parts of the Bible were translated into Magyar, and distinguished orators and poets made the language the vehicle of their appeals to the national feeling. In the 17th c. the entire Bible was translated into Magyar, the Hungarian muse found new votaries, and eminent orators arose to stir the hearts of the people by addressing them in their native tongue. But the influence of the German dynasty arrested the national movement, and Latin again predominated. Near the close of the last c. there was a reaction, and societies for the cultivation of the Magyar tongue were formed, and various periodicals founded in the same interest. The new movement, identical as it was with the regeneration of the nation, was successful; and within the first 25 years of the present c. all foreign elements gave way before it. The credit of this is largely due to Francis Kazinczy, the great linguistic reformer, and the poets Csokonsi, Dayka, Verseghy, Alexander, and Virág. The golden age of Hungarian literature was the 30 years preceding the revolution of 1848–49. Charles Kisfaludy, brother of Alexander, created the Hungarian drama by his tragedies and comedies. Kölesey by his logical poems, ballads, prose writings, and orations, exerted a potent influence upon the patriotism of the nation, Fay's fables, and Czuczor's and Vörösmarty's popular epics also did much to evoke and foster a true national feeling. Bajza was not only an eminent lyrical poet, but a historical writer and æsthetical critic. Jósika and Eötvös, eminent in the field of historical faction, exercised a large influence. Belenyei, Császàr, Bartholomew Szemere, and others wrote books of travel. As political writers Szezhenyi, Kossuth, Eötvös, and others took high rank; while in the field of history Horváth, Péczely, Jászay, and Bajza did excellent work. Szontágh, Márki, Gregus, and others wrote historical treatises; while the natural sciences, theology, languages, and antiquities did not lack for exponents. The revolution of 1848–49 doomed many gifted writers to the dungeon, the scaffold, or exile, and the literature of the last 30 years is not on the whole equal to that of the preceding period. The restoration of the Hungarian constitution has, however, brightened the literary prospects of the country.

HUNGARIAN WINES (HUNGARY, *ante*). See GERMAN WINES.

HUNGARY (Ger. *Ungarn;* Magyar, *Ország* (land of the Magyars), a portion of the Austro-Hungarian empire. According to the fundamental laws of the realm, the emperors of Austria are kings of Hungary, which formerly comprehended Hungary proper, Croatia, Slavonia, Dalmatia, the Illyrian sea coast, Transylvania, and the whole of the military frontier. After 1848 these pendicles were dissociated administratively from Hungary proper and converted into crown lands. Since 1867 Hungary, Croatia, Slavonia, Transylvania, and the military frontiers, have constituted the kingdom of Hungary, one member of the bipartite empire. The two knots which tie Austria proper and Hungary together are the person of their common sovereign and the "delegations"—a parliament consisting of 120 members, of which 60 are supplied by either portion of the empire. This body legislates for war, finance, and foreign affairs; and the ministers of these three departments are responsible to it, or to a committee of its members. Hungary has an area of 124,560 English sq.m., and a population (1870) of 15,509,455; (1876) 15,784,500. The general features of the country are given under the article Austro-Hungary (q.v.), to which may be added that the soil of the vast plains consist chiefly of humus and clay, and is of great fertility. Huge tracts of sand are to be found in several parts; there are also swamps all along the Theiss. The level tracts in the eastern part of Hungary are subjected to periodical drought, and to frequently recurring blasts. The heat is sometimes so great, that it is impossible to walk with bare feet on the burning sand. Autumn and winter are of short duration. In spring, great part of the level land becomes an almost impassable ocean of mud. Hail-storms during summer, and the severity of cold during winter, cause much anxiety to farmers, and more especially to the numerous class of vine-growers. Ague is common in some regions, but the climate is healthful upon the whole.

Hungary is an agricultural country in the main, though the methods of cultivation are exceedingly defective. In many places the ground is not even manured. In Hungary proper, exclusive of Transylvania, Croatia, and Slavonia, about one-twelfth of the whole soil is unproductive, one-third is arable land, one-fourth is wooded, one-fourth in pasture, one-seventy-first devoted to the culture of the vine. Magnificent forests clothe all the hilly regions; yet in the low country wood is so scarce that dung has to be used for fuel. Grain is produced in abundance, and beyond what is needed for home consumption. The order of importance of the various kinds is oats (of which one-third is exported), barley, rye, maize, and wheat. Vast quantities of hemp and flax are raised. For more than 150 years tobacco has been raised in Hungary. Large quantities are still grown, the sale of it being, however, a government monopoly. Potatoes are little used for food save by Germans, but are available for making spirits. The culture of fruit is almost wholly left to the Germans, and is most productive in their hands; the fine climate brings, for example, no less than 50 kinds of peaches to perfection. In many parts of Hungary, figs, almonds, and even olives thrive. Wine is one of the most important sources of Hungarian comfort and wealth. France alone excels Hungary in the quantity of wine produced; the total production is estimated at 400,000,000 gallons, and could be much

increased. But the system of culture, and the methods used in preparing the wine are so primitive and imperfect, that not over 50,000,000 can be made fit for export. The wine of Hungary was used in England in the days of James I. The finest Hungarian wines are the yellowish brown Tokay (to the production of which upwards of 100 sq. m. of land are devoted), a dark red wine called Menes, and the well-known Ruster dessert-wine. Cattle-breeding is a great source of trade. Of large cattle Hungary possesses over three and a half millions; of sheep, twelve and a half; and swine innumerable. The number of geese and ducks may be inferred from an annual export of 150 tons of feathers. Horses are carefully reared in Hungary; there are nearly two millions of them in the land. No country of Europe has greater attractions than Hungary for the sportsman; the chamois, bears, and wild boars are still found. Red deer abound, as do fowls and fish of all descriptions. In its minerals Hungary has vast sources of wealth. Russia alone surpasses Hungary for its richness in the noble metals; very considerable quantities of gold and silver, generally mingled, being found. Copper and iron are largely produced. Antimony, cobalt, and arsenic are wrought, as are salt, soda, natural saltpeter, and alum. Opals and amber occasionally appear; marble and alabaster, coal, pitch, and graphite are available in various districts. In regard to its industry, Hungary is yet far behind; a little of the commoner kinds of linen and woolen cloths, leather, sugar, glass, paper, and spirits are its chief manufactures. The trade in grain, flour, sheep, wool, and skins is brisk. Of the total population, upwards of 5,000,000 are engaged in agriculture and mining, 65,000 in industrial work, 134,000 in trade, and nearly 180,000 follow professional pursuits. Hungary has few good roads; the rivers, especially the Danube, are the great channels of communication. About 2,700 m. of railway are in operation. Besides the capital, which has a population of over 200,000, there are in Hungary four cities of 50,000 inhabitants and upwards, and three others above 40,000. In educational affairs Hungary has till of late been very backward. In 1871, out of 2,206,187 children of sufficient age, 1,253,500 were at school; 47 per cent of the men and 55 per cent of the women in Hungary can neither read nor write. Yet the educational apparatus of Hungary is on a liberal scale. The university of Buda-Pest has 52 ordinary and 15 extraordinary professors, 38 *privat-docents*, and nearly 2,500 students. The polytechnic school there has about 50 teachers. Since 1872 there is also a university in Klausenburg. There are theological seminaries for all the various confessions, and of late great efforts, not without good result, have been made to raise the educational status of the country; insomuch that the annual expenditure on education rose from 981,000 florins in 1868 to 2,764,000 florins in 1872. In 1871 and 1872 there were 900 new schools opened, and 1002 new school-houses erected. Besides 14,000 primary schools, there are now in Hungary and Transylvania about 180 gymnasia; and academies, learned societies, and associations for the promotion of Hungarian literature exist. Newspapers and periodicals to the number of 205 appear regularly; of these more than half are Magyar, about 30 are Slavic, one-fourth are German, and two or three Rumanian.

In no other European country is there such a mixture of races differing in blood, speech, and manners. In Hungary proper about 50 per cent of the whole population is Magyar; Slavic (including Slovaks, Ruthenians, Croats, and Serbs), 32 per cent; German, 14.3; Rumanian, 11; Jew, 1½; Gipsy, ½. In Transylvania the number of various elements is as great, Roumanians forming here three-fifths of the whole, and the Magyars being about half as many. In Croatia and Slavonia naturally Slavs have the predominance; 98 per cent of the whole being Croat or Serb. The town of Fiume, which has since 1870 been attached to Hungary, is quite German in character. In 1869 the population of Hungary in the wide sense contained 9,163,319 Roman Catholics (7,500,000 being of the Latin ritual, the others united Greek and Armenian); 3,144,751 Protestants (Calvinist and Lutheran); and 2,589,319 of the Greek church; besides Unitarians (55,000), Jews (553,000), and heathens (223). The divisions of race coincide to a large extent with religious distinctions. All Hungarians, Germans, and Slovaks, as also the Croats in Hungary are either Catholic or Protestant; Rumanians, Ruthenians, and Serbs are either united or orthodox Greeks. In Hungary, Transylvania, Croatia, and Slavonia, the Catholic church has 4 archbishops and 20 bishops; 203 monasteries with 2,417 inhabitants, and 80 nunneries with 1136 nuns. The Greek Catholics are under an archbishop and 6 bishops, and have 9 monasteries. The orthodox Greeks have 2 archbishops and 7 bishops, and have 3 monasteries. The Lutherans and Calvinists have each 5 superintendents or overseers of ecclesiastical districts. The Unitarians have but one.

History.—The Hungarians—in their own language, Magyars—are sprung from that group of Tartaric races to which the Turks also belong (see TURANIAN LANGUAGES); their ancient seats being in central Asia. Part of the people emigrated in the direction of the Ural mountains, and thence, being pressed by the warlike swarms of Paimacitae, to the regions now known as Moldavia and the Ukraine. In 889, 40,000 families, counting more than 200,000 warriors among them, left their homes under the leadership of Almos, and after many a hard battle arrived at the north-eastern frontiers of the land, which, under the name of Pannonia, contained several independent realms, such as Great Moravia, the Slavo-Bulgarian kingdom of Zalan, etc. The great task of conquest being now at hand, old Almos resigned, and his son Arpád being unanimously elected

as chief, the armed invasion began at once in several directions. At the end of 899 Arpád's sway extended from the Carpathians down to Servia, and from the eastern borders of Transylvania to the foot of the Styrian mountains. According to a covenant between Arpád and the other chiefs, the leadership was to remain with the descendants of the former as long as they should keep faithful to the nation. The foundations which were then laid for the political organization of the realm have been developed through lapse of time into that system of municipal independence which has outlived the storms of nearly a thousand years, and contains, even after the disastrous issue of 1849, the germs of future national greatness. The periods into which the history of Hungary is divided are: 1. Period of chiefs of the house of Arpád (894–1000); 2. Period of kings of the house of Arpád (1000–1301); 3. Period of kings from different (foreign) families (1301–1526); 4. Period of kings of the house of Hapsburg (1526 to the present day). The first king of Hungary was Stephen I., called the saint; he was crowned in the year 1000 with a crown that had been sent to him by the pope, Sylvester II. It forms to-day the upper part of "the sacred crown of Hungary."

With St. Stephen a new era began for Hungary; Christianity took the place of heathen superstitions; the savage incursions, by which *the people of the east* became a scourge to neighboring nations, ceased entirely. The house of Arpád gave 20 kings to Hungary, the greatest of whom undoubtedly was Stephen I., who, besides dividing the realm into 10 bishoprics, more completely developed the administrative system. Among his successors, Béla I. (1061–63) distinguished himself by saving the hardly begun Christian civilization against the rebellious attempt of a numerous party. Ladislaus I. is renowned for wise legislation and for great personal valor. Such was the renown of his deeds, that at the council of Piacenza (1095) he was unanimously elected to be the leader of the crusade to Palestine. Death prevented the hero from accomplishing the task. Coloman (1095–1114) went by the name of "Learned," and many of his laws show how much he was in advance of the age. Gejza (1141–61) was but 10 years old when crowned; nevertheless, his reign is worthy of mention, for it was then that colonists from Flanders settled in northern Hungary, as also in Transylvania, in consequence of which, mining and several branches of industry made rapid progress. Andrew II. (1205–35) is known in connection with the crusades; the Hungarian magna charta (bulla aurea), forced from him by his nobles, dates from 1222. Béla IV. (1235–70) showed great qualities in subduing the indomitable arrogance of the oligarchy, and in healing the wounds of his people after the terrible invasion of the Mongols in 1242. Andrew III. was the last male scion in the Arpád line; he died without issue in 1301. During the mixed period, two kings, besides the governor Hunyady (q.v.), especially distinguished themselves. Lewis I., called the great (1342–81), was the second king from the house of Anjou, being by his great-grandmother connected with the Arpád dynasty. Lewis extended the sway of the Hungarian scepter to limits formerly unknown; re established at home the authority of law, trodden down by the mighty oligarchs under his predecessors; and promoted science, industry, and commerce. One of the remarkable episodes of his reign was the expedition to Italy to punish the assassins of his unfortunate brother, Andrew, spouse of the famous Joan of Naples. Sigismund (1387–1437) is better known as emperor of Germany. As a curious incident in the life of a sovereign may be mentioned his imprisonment at Siklós during six months. Sigismund was released only after he had taken the oath to his Hungarian subjects, vowing fidelity to the constitution. Mathias I.—better known by the name of Mathias Hunyady or Mathias Corvinus (see MATHIAS)—may be said to have been not only the greatest king of Hungary, but also the greatest sovereign of his age. By his valor, sagacity, and love of learning, he raised his nation to the pinnacle of fame. From the death of Mathias to the day of Mohács, Hungary exhibits the fiercest strife of factions—a protracted agony, preceding the loss of national independence. Among the many calamities during the reign of Vladislas II. of Bohemia (1490–1516), the peasant war occupies a prominent place. Dózsa and his bands, after having committed great havoc, were exterminated by the famous John Zapolya of Transylvania, *and the whole of the peasantry reduced to a state of serfdom.* Lewis II. was but 10 years old at the death of his father, Vladislas II. Another 10 years of rapid disorganization was required to make a disaster like that of Mohács possible. See MOHÁCS, BATTLE OF. The further history of Hungary is indissolubly connected with that of the Austrian empire, and may be read as to its principal features under the head AUSTRIA.

Fundamental Laws of Hungary.—1. The golden bull of Andrew II., given in the year 1222, upon the return of the king from Palestine, contains 31 articles, of which article 2 is a kind of habeas corpus act, but for nobles only. One clause of article 31, declaring armed resistance to any illegal acts of the king not punishable by law, was canceled by article 4 of the diet in 1687.

2. Treaty of peace of Vienna, 1606. It was concluded on June 23, between Mathias II. and Stephen Boeskay. Article 1 enacts freedom of worship to Protestants, as far as is consistent with the established rights of the Roman Catholic church.

3. Treaty of peace of Linz, enacted during the diet of 1646–47. Public worship is once more secured to Protestants, such freedom being for the first time extended also to the peasants. Protestants were to be admitted to public functions on an equal footing with Catholics.

4. The pragmatic sanction, contained in article 2 of the diet of 1722–23. In case there should be no male issue in the dynasty of Hapsburg, the females and their descendants are to succeed to the Hungarian throne. The king must be a Roman Catholic, must take oath to the constitution, and sign the so-called *diploma inaugurale*, thus confirming the rights and privileges of the nation. Should there be no descendant, male or female, of the reigning house, the freedom of electing their king belongs to the nation.

Article 11 of 1741. Maria Theresa, abandoned by her allies, surrounded on all sides by fearful dangers, won the love of the Hungarian nation by acceding to their just and legitimate claims. The government of Hungary was confided to Hungarians only; in public affairs, the primate, the palatine, and the ban were to be consulted. Hungarians were to be eligible for seats in the ministry. Article 17 of 1790–91 renews those enactments.

Article 10 of 1790–91 establishes the independence of the Hungarian kingdom with its annexed parts. *Article* 12 *of the same year declares that the power of making, changing, and interpreting laws in the kingdom of Hungary belongs to the sovereign legitimately crowned, together with the diet legally convened. Nothing can be done in Hungary by means of royal letters-patent.* Article 13 orders that the diet shall be convoked at least once every three years.

Article 16 guarantees the nation the use and culture of the Magyar tongue.

Article 19 secures to the diet the right of voting taxes and of fixing the number of recruits.

Up to the year 1848 the nobles were free from contribution and military service; they occasionally gave subsidies; and in case of extreme necessity, rose in arms for the defense of the country. Article 8 of 1847–48 enacts the great principle that all classes are to participate in the public burdens of the realm. Article 9 abolishes statute labor; the peasant could henceforward become owner of real property; and indemnity was given to their former masters. Article 5 of 1847–48 establishes the principle of popular representation upon the basis of taxation.

In 1860 the decree of 1849, declaring that Hungary had by the rebellion forfeited its national constitution, was formally repealed, and the old constitutional system was restored. And in June, 1867, the emperor of Austria solemnly swore to maintain the constitution, and was crowned king of Hungary.

The Hungarian reichstag or diet consists of the house of magnates and the house of representatives. In 1879 the former counted nearly 800 members. Of the 444 members of the latter, 384 represent Hungary proper, 1 Fiume, 75 Transylvania, and 34 Croatia and Slavonia. The lower house is composed of representatives of the towns and rural districts. It is elected by the votes of all citizens of age who pay direct taxes to the amount of 16s. a year. Neither electors nor their representatives are affected by any distinction of race or religion.

Hungarian Language and Literature.—Notwithstanding the general sympathy that prevails for Hungary, many are of opinion either that the Hungarians are but a half-civilized people, or that their language and literature are in some sense or another Germanic or Slavonic. The Magyar tongue is as much distinct from German or Slave as is the French or Italian. The language of the Hungarians is called Magyar, and forms, together with the Mogul, the group Ugri, belonging to the great Finnic family. As to its syntax, the language is nearest to the Turkish. Among its characteristics may be noted that the Christian name occupies always the second place, as, for instance, Hunyady János = John Hunyady. How rich in expressions, how abundant in classic beauties that language is, may be collected from the circumstance that although it was excluded from public life during 8 centuries (Latin being used in schools, legislation, and administration), Hungary possesses to-day a literature which, both in regard to its quantity and quality, will sustain a comparison with that of the most civilized among the western nations. Especially as regards poetry, the names of Kisfaludy, Vorösmasty, Petöfi, Arany, etc., are well worthy of being ranked with the best in other lands. Those who are desirous of further information on this interesting subject should consult Toldy's admirable *Handbook of Hungarian Literature*, published both in Magyar and German.

HUNGARY-WATER, a very celebrated perfume, for the preparation of which various receipts have been given. The following is one of the best: Take of fresh rosemary in blossom, 4 lbs.; fresh sage in blossom, 6 oz.; ginger in slices, 2 oz.; cut them in small pieces, mix, and add rectified spirit 12 lbs., and common water 2 pints. Let 11 pints distil by a gentle heat. A hermit is said to have given the original receipt to a queen of Hungary, and hence it was called the *Queen of Hungary's Water*, which has been abbreviated into Hungary water. It is employed principally as a perfume for the toilet; but it is sometimes taken internally as a restorative and stimulant, and it may be used externally as a gently stimulating liniment.

HUNGER. See DIGESTION.

HÜNINGEN (French, *Huningue*), a small t. in the s. of Alsace, is situated on the left bank of the Rhine, 37 m. s.s.e. of the town of Colmar. Pop. '71, 1456.

This place, still remarkable for its pisciculture, was formerly the center of the French

system. A series of buildings and artificial ponds, covering a space of 70 imperial acres, was erected in 1852–54 for the breeding and acclimatizing of foreign fish. The total cost was £10,607. The expense of carrying on the plan from 1853 to 1862 amounted to £13,887, and the annual cost after the latter year averaged about £2,000. This establishment enabled the French government during the second empire to restock many of the barren rivers of France with valuable fish. See PISCICULTURE.

HUNS (Lat. *Hunni;* Gr. *Ounnoi* and *Chounoi*), the name of a considerable nation of antiquity, which, from time to time, made incursions upon the Roman dominions, and which eventually, under Attila, the most renowned of its leaders, brought the empires of both the east and the west to the very verge of destruction.

The Huns were of Asiatic origin, and, in all probability, of the Mongolian or Tartar stock; therefore akin to, and perhaps to be identified with, the Scythians and Turks. According to De Guignes, whose theory has been accepted by Gibbon, the Huns who invaded the Roman empire were lineally descended from the Hiong-nou, whose ancient seat was an extensive but barren tract of country immediately to the n. of the great wall of China. About the year 200 B.C., these people overran the Chinese empire, defeated the Chinese armies in numerous engagements, and even drove the emperor Kao-ti himself to an ignominious capitulation and treaty. During the reign of Vou-ti (141–87 B.C.), the power of the Huns was very much broken. Eventually, they separated into two distinct camps, one of which, amounting to about 50,000 families, went southwards, while the other endeavored to maintain itself in its original seat. This, however, it was very difficult for them to do; and eventually the most warlike and enterprising went w. and n.w. in search of new homes. Of those that went n.w., a large number established themselves for a while on the banks of the Volga. Then crossing this river, they advanced into the territories of the Alani, a pastoral people dwelling between the Volga and the Don. At what period this took place is uncertain, but probably it was early in the 4th century.' The Alani, who had long dwelt in these plains, resisted the incursions of the Huns with much bravery and some effect, until at length a bloody and decisive battle was fought on the banks of the Don, in which the Alan king was slain, and his army utterly routed; the vast majority of the survivors joined the invaders.

The Huns are described as being of a dark complexion, almost black; deformed in their appearance, of uncouth gesture and shrill voice. "They were distinguished," says Gibbon, "from the rest of the human species by their broad shoulders, flat noses, and small black eyes deeply buried in the head; and as they were almost destitute of beards, they never enjoyed either the manly graces of youth, or the venerable aspect of age. A fabulous origin was assigned worthy of their form and manners—that the witches of Scythia, who for their foul and deadly practices had been driven from society, had copulated in the desert with infernal spirits; and that the Huns were the offspring of this execrable conjunction." Such was the origin assigned to them by their enemies the Goths, whom the Huns now invaded with fire and sword. Hermanric, the aged sovereign of the Goths, whose dominions reached from the Baltic to the Euxine, roused himself to meet the invaders, but in vain. His successor, Withimir, encountered the Huns in a pitched battle, in which he was himself slain, and his countrymen utterly routed. These now threw themselves upon the protection of the emperor Valens, who in 376 gave permission to a great number of them to cross the Danube and settle in the countries on the other side as auxiliaries to the Roman arms against further invasion. The Huns now occupied all the territories that had been abandoned by the Goths; and when these, not long afterwards, revolted against Valens, the Huns also crossed the Danube, and joined their arms to those of the Goths in hostilities against the Roman empire. In the wars that followed, the Huns were not so conspicuous as the Goths, their former enemies. Indeed, we now hear but little of the Huns during the remainder of the 4th century. It is supposed, however, that early in the following century they were joined by fresh hordes of their brethren, a circumstance which encouraged them to press onward towards further conquests. In the reign of Theodosius the younger, they had increased so considerably in power, that their sovereign Rugilas, or Roas, was paid an annual tribute to secure the Roman empire from further injury.

Rugilas, dying in the year 434, was succeeded in the sovereignty of the Huns by his nephews Attila (q.v.) and Bleda. With Attila's death, however, in 454, the power of the Huns was broken in pieces. A few feeble sovereigns succeeded to him, but there was strife now everywhere among the several nations that had owned the firm sway of Attila, and the Huns especially never regained their power. Many of them took service in the armies of the Romans, and others again joined fresh hordes of invaders from the n. and e., aiding them in their repeated attacks upon the moribund Roman empire.

HUNT, a co. in n.e. Texas, on Sabine river; 850 sq.m.; pop. '80, 17,229—1214 colored. The surface is hilly and well wooded; chief productions: cotton, corn, and pork. Co. seat, Greenville.

HUNT, HELEN. See JACKSON, HELEN HUNT.

HUNT, HENRY, 1773–1835; b. England; a friend of Cobbett, Horne Tooke, and similar reformers; presided over a reform meeting in Manchester in 1819, on which occasion the military interfered and many persons were killed. Hunt was imprisoned,

and on his release nearly three years afterwards, became a hero-martyr, made showy parades, and in 1830 was elected to parliament, defeating the earl of Derby. He devoted much of his life to forwarding the interests of the reform bill, whose passage he was fortunate enough to witness.

HUNT, HENRY JACKSON, b. Mich., 1819; graduated at West Point; served in the war with Mexico in many actions, and until its conclusion. In the war of the rebellion he was on McClellan's staff, was commander in-chief of the artillery of the army of the Potomac, and at the end of the war held the rank of maj.gen. of volunteers. He has published papers on artillery, on projectiles, on army organization, etc., and was made president of the permanent artillery board of the army.

HUNT, JAMES HENRY LEIGH, poet and essayist, was b. in London, Oct. 19, 1784, educated at Christ's hospital, and first attracted notice as a writer of theatrical and literary criticisms for the *Examiner* newspaper, which was started in 1805 by his elder brother John. At the age of 24 he became joint editor and proprietor of the *Examiner*. He was a liberal in politics before liberalism had become fashionable; and for one of his articles, reflecting on the obesity of the prince regent—"a fat Adonis of fifty," Hunt had called him—he was sentenced to pay a fine of £500, and to undergo two years' imprisonment. Hunt was happy enough in his confinement; he hid the prison bars with flowers, and received visits from Byron, Shelley, and Keats. On his release he published *The Story of Rimini*, which he had written in prison, and which gave him a place among the poets of the day. *Foliage* appeared in 1818, and about the same time he started the *Indicator*, a serial suggested by the *Spectator* and *Tatler*. In 1828 he published *Lord Byron and his Contemporaries*, the record of a brief and not very pleasant companionship in Italy with his lordship, which gave great offense to Byron's friends. In the same year he started *The Companion*, a sequel to *The Indicator*, both of which were republished as one book in 1834. In 1833 he published a collected edition of his poetical works. In 1834 he started the *London Journal*, which he edited for two years. His principal works, besides those already mentioned, are: *Captain Sword and Captain Pen* (1835); *Legend of Florence* (1840); *The Seer*, a publication similar to *The Indicator; The Palfrey* (1842); *Sir Ralph Esher*, a novel (1844); *Imagination and Fancy* (1844); *Wit and Humor* (1846); *Stories of the Italian Poets, with Lives* (1846); *Men, Women, and Books* (1847); *A Jar of Honey from Mount Hybla* (1848); his *Autobiography* (1850); *The Religion of the Heart* (1853); and *The Old Court Suburb* (1855). In 1847 he received from the crown a pension of £200. He died at Highgate, Aug. 28, 1859. A selection from his *Letters and Correspondence* was published by his son, Mr. Thornton Hunt, in 1862.

Hunt's reputation rests upon his poems and essays. *The Story of Rimini* is, on the whole, perhaps the finest narrative which has appeared since Dryden, and his *Palfrey* is delightful from its good spirits and bright sunny glimpses of landscape and character. As an essayist, he is always cheerful and fanciful, and he looks determinedly at the bright side of things. The sky may be gloomy, but if there is a bit of blue in it, he, with an admirable practical philosophy, constantly turns his eye to *that*. He delights to wreath the porch of the human dwelling with roses and honeysuckles. Among his poems are to be found several translations, which are the best things of the kind we possess. He transports the wine of Greece and Italy to England, and its color and flavor are rather improved than otherwise by the voyage.

HUNT, JOHN, b. England, 1812; a Wesleyan missionary in the Fiji islands, where he labored many years. He translated the New Testament into the native tongue.

HUNT, RICHARD MORRIS, b. Vt., 1828; chose the profession of architect, and in 1843 went to Europe, and studied in Paris, Greece, Asia, and Egypt. In Paris he was employed on the work connecting the Tuileries with the Louvre. In 1855 he returned to his own country, and has been the architect of the capitol extension at Washington, the Lenox library and the *Tribune* building, New York, and other important structures.

HUNT, THOMAS STERRY, LL.D., PH.D.; b. Conn., 1825. In 1845 he became assistant to prof. Silliman in his chemical laboratory at Yale college, and in 1847 was appointed chemist and mineralogist to the geographical survey of Canada. He held this post for more than twenty-five years, resigning in 1872 to accept the chair of geology in the Massachusetts institute of technology. His earlier studies were directed especially to theoretical chemistry, developing a theory essentially his own, in which all chemical compounds are deduced from simple types represented by one or more molecules of water or of hydrogen. These views are maintained by him in a series of papers in the *American Journal of Science*, beginning in 1848. His researches into the chemical and mineral composition of rocks have probably been exceedingly thorough; while his investigations of the chemistry of mineral waters have led him to form a theory of their origin and formation, and their relations to the origin of rock masses, both crystalline and uncrystalline, and to lay the basis for a system of chemical geology. He has discussed the phenomena of volcanoes and igneous rocks, and has revived the theory that the source of these is to be sought in the chemical reaction set up in the sedimentary deposits of the crust of the earth, through the agency of internal heat; and has sought to harmonize the facts of dynamical geology with the notion of a solid globe, in oppo-

sition to that which holds to a globe with a liquid interior. His views on these and other kindred questions, are to be found in an essay on the *Chemistry of the Earth*, in the report of the Smithsonian institution for 1869, in his address as retiring president of the American association for the advancement of science, and in more recent papers. His contributions to American and European scientific societies and journals are very numerous; and a collection of many of them was published in 1874. He furnished many important articles in his specialty to Appleton's *American Cyclopedia*, and is a member of the leading societies of both continents. He has reported fully on the auriferous quartz belt of Nova Scotia.

HUNT, THORNTON, 1810–73, b. England; an art critic, son of Leigh Hunt; was educated as a painter, but preferred the profession of a writer, and took charge of the political department of the *Constitutional* as long as it existed, and was afterwards associated with the London *Spectator* (1840–60). He edited Leigh Hunt's autobiography, and was the author of a romance entitled *The Foster Brother*.

HUNT, WARD, LL.D., b. N. Y., 1810; graduated from Union college in 1828. In 1839 he was elected to the state assembly; in 1844 was chosen mayor of Utica, and in 1865 was elected judge of the court of appeals. In 1870 he was commissioner of appeals, and in 1873 was appointed a judge of the U. S. supreme court.

HUNT, WILLIAM, an eminent English painter in water-colors, was b. in London in 1790. He ranks very high in his profession, no less an authority than Mr. Ruskin pronouncing him to be among the greatest colorists of the English school. His subjects are very simple—"Peaches and Grapes," "Old Pollard," "Basket of Plums," "Roses," "Wild Flowers," "Trampers at Home," "A Farmhouse Beauty," "Fast Asleep," etc., but they are conceived in a finely poetical spirit, and present the perfection of finish. He died Feb., 1864.

HUNT, WILLIAM HOLMAN, a celebrated English painter of the present day, was b. in London in 1827, and exhibited his first picture, entitled "Hark!" in 1846. During the next few years, his reputation steadily advanced; but while the young artist was winning fame, he was at the same time becoming more and more dissatisfied with the principles and practices that ruled his art, and along with Millais, Rosetti, and other young painters who shared his convictions, he commenced a new style of treatment, known as the *Pre-Raphaelite*. This term was originated by Hunt and his friends, and was employed by them to indicate their predilection for the painters who lived before Raphael, such as Giotto and Fra-Angelico, but did not at all imply that they meant to take the productions of these masters as technical models. It was because of their truthfulness and earnest simplicity that they admired the fathers of Italian art. The first of Hunt's works that showed the new influence was his "Converted British Family sheltering a Christian Missionary from the Persecution of the Druids" (1850). He afterwards produced, among others, "Valentine rescuing Sylvia from Proteus," "The Hireling Shepherd," "Our English Coasts," "London Bridge on the night of the Marriage of the Prince of Wales," "The After-Glow," "The Festival of St. Swithin," "The Awakened Conscience," "The Light of the World," "The Scape Goat," "Christ disputing with the Doctors in the Temple," and the "Shadow of Death" (1873). The last four are perhaps Hunt's greatest; and multitudes who do not care to understand the *vexata quæstio* of Pre-Raphaelitism, have been moved by their tenderness and religious truth.

HUNT, WILLIAM MORRIS, 1824–79, b. Vt.; an artist, and one of the first to introduce the characteristics of the French school into the United States. He was a pupil of Couture in Paris in 1848. Among his productions are "The Lost Kid," "The Choristers," "Girl at the Fountain," "Marguerite," "Morning Star," "Bugle Call," etc. He also painted portraits of many celebrated persons, excelling in this department of art, but gaining his high reputation through his skill and originality in genre-painting.

HUNTER, the name of a river in New South Wales, which enters the Pacific 75 m. n. of Sydney.

HUNTER, DAVID, b. D. C., 1803; graduated at West Point in 1822. In the war of the rebellion he commanded a division at Bull Run, in which conflict he was wounded, and was at once promoted to maj.gen. of volunteers. While in command of the department of the south in 1862 he declared slavery abolished, but was overruled by president Lincoln. He was on the commission that tried the murderers of Lincoln, and in 1866 was placed on the retired list.

HUNTER, JOHN, the greatest name in the combined character of physiologist and surgeon that the whole annals of medicine can furnish; was b. at Long Calderwood, in Lanarkshire, in 1728, and was the youngest of 10 children. One of his brothers, William, claims a separate notice. One of his sisters, Dorothea, was married to Dr. James Baillie, professor of divinity in the university of Glasgow, and was the mother of Matthew Baillie (q.v.), and Joanna Baillie (q.v.). The fact that his father died when Hunter was only 10 years of age, and the probability that he was over-indulged by his mother, explain how, at the age of 20, he could simply read and write, and was ignorant of every language except his own. The fame of his brother William's success as an anatomical lecturer, made Hunter desirous of entering into the same profession, and he

accordingly applied for and obtained the situation of assistant in the dissecting-room. His progress in anatomy and surgery was so rapid that in the second session he was able to undertake the directing of the pupils in their dissections. He studied surgery under Cheselden (the celebrated lithotomist), at Chelsea hospital, during the summer months of 1749 and 1750; and subsequently under Pott.

In 1753 Hunter entered as a gentleman commoner at St. Mary's hall, Oxford; but finally deciding on confining himself to the practice of surgery, he entered St. George's hospital as surgeon's-pupil in 1754, and two years afterwards served the office of house-surgeon. In the course of this year (1754), Hunter became a partner with his brother in the anatomical school. After 10 years' hard work in the dissecting-room his health began to give way, and in 1759 he was strongly advised to seek a more southerly climate. With this view he applied for an appointment in the army, was immediately made staff-surgeon, and sent out to Belleisle, and afterwards to the Peninsula; but in 1763, peace having been proclaimed, he returned home, permanently settled in London, and with nothing but his half-pay and his own talents to support him started as a pure surgeon. For a while he had not a great practice, and consequently devoted much time and money to comparative anatomy. He was in the habit of purchasing the bodies of animals that died in the tower, and in traveling menageries; and in order conveniently to carry on his anatomical and physiological inquiries, he purchased a piece of ground at Earl's Court, Brompton, where he built a small house, in which he made most of his researches. In 1767 he was elected a fellow of the royal society, and in the following year was appointed surgeon to St. George's hospital. This appointment led to an increase of his practice, and enabled him to take pupils, each of whom paid him 500 guineas. Jenner (q.v.) was one of the earliest of these, and always spoke of his old master in terms of regard and affection. In 1771 he married Miss Home, sister of Mr. (afterwards sir Everard) Home.* His practice at this time was increasing rapidly, but his income never reached £1000 a year until 1774. In 1773 he had the first attack of a disease (*angina pectoris*) which ultimately proved fatal. In 1776 he was appointed surgeon-extraordinary to the king.

In 1783 he determined to build a museum. The building, which was completed in 1785, consisted of an upper room for the reception of his collection, 52 ft. long by 28 wide, under which were a lecture-room, and another room which became the place of meeting of the lyceum medicum, a society established by Hunter and Fordyce. It was in Dec. of that year that he planned and carried into execution his famous operation for the cure of aneurism—that of simply tying the artery at a distance from the tumor, and between it and the heart, thus introducing into surgery an improvement which has been more fruitful in important results than any since Ambrose Paré's application of ligatures to divided arteries. In 1786 Hunter was appointed deputy-surgeon-general to the army; in 1787 he received the Copley medal from the royal society. He was now universally acknowledged, by all the younger surgeons, as the head of his profession; but most of his contemporaries looked upon him as little better than an innovator and an enthusiast. He died Oct. 16, 1793, and was buried in the church of St. Martin's-in-the-Fields, from whence his remains were removed, in 1860, to Westminster Abbey, where a suitable tablet to his memory has been erected by the council of the royal college of surgeons.

Some idea may be formed of Hunter's extreme diligence, by the fact that his museum contained at the time of his death 10,563 specimens and preparations illustrative of human and comparative anatomy, physiology, pathology, and natural history. He died in comparative poverty, and his collection was purchased, two years after his death, by government for £15,000, and was presented to the royal college of surgeons, by whom it has been much enlarged.

In addition to numerous papers contributed to the *Transactions* of the royal and other learned societies, he published the following independent works: *A Treatise on the Natural History of the Human Teeth* (part i. 1771; part ii. 1778); *A Treatise on the Venereal Disease* (1786); *Observations on Certain Parts of the Animal Economy* (1786); and *A Treatise on the Blood, Inflammation, and Gunshot Wounds* (published in 1794). Mr. Palmer, with the literary assistance of several eminent surgical friends, published an excellent edition of *The Works of John Hunter, F.R.S., with Notes*, in 4 volumes, in 1835. To this is prefixed *The Life of John Hunter, F.R.S.*, by Drewry Otley, from which most of the materials of this sketch have been taken.

HUNTER, Robert Mercer Taliaferro, b. Va., 1809; educated at the state university, and began the practice of law. In 1837 he was a member of congress, and two years afterwards was chosen speaker of the house of representatives. In 1846 he was elected to the senate. When the rebellion began he went with the confederates and was for a brief time the secretary of state of the temporary confederate government. In 1865 he was one of the peace commissioners sent to confer with president Lincoln, but the conference amounted to nothing. His acts of treason were pardoned by Andrew Johnson in 1867.

*Mrs. Hunter had a taste for music, and was the auther of several popular songs. *My Mother bids me bind my Hair* is one of hers, and was written to an air of Pleydell's.

HUNTER, WILLIAM, M.D., the elder brother of John Hunter, was b. at Long Calderwood, in the parish of Kilbride, Lanarkshire, in 1718, and died in London in 1783. After studying for five sessions in the university of Glasgow, with a view to entering the church, he determined to devote himself to the profession of physic. He passed the winter session 1740–41 in Edinburgh, and in the summer 1741 arrived in London, where he resided with Dr. James Douglas, the well-known anatomist and obstetric physician, for the double purpose of assisting in dissections, and superintending the education of his son. Hunter was then entered as a surgeon's pupil of St. George's hospital, and as a dissecting pupil of Dr. Frank Nicholls, who was then teaching anatomy with great success. To teach anatomy was now the object of his ambition, and in 1746 an opportunity of doing so occurred. A society of naval surgeons had for several years engaged Mr. Sharpe to deliver a course of lectures on the operations of surgery, and on his resignation, Hunter received the appointment. He gave so much satisfaction, that the society requested him to extend his plan to anatomy. In 1747 Hunter was admitted a member of the corporation of surgeons. In the early part of his career, he practised both surgery and midwifery, but he gradually confined himself to the latter line of practice. He was appointed one of the surgeons-accoucheur to the Middlesex hospital in 1748, and to the British lying-in hospital in 1749.

In 1762 Hunter was consulted by queen Charlotte, and two years afterwards was appointed physician-extraordinary to her majesty. In 1767 Hunter was elected a fellow of the royal society, and in the following year was appointed professor of anatomy to the royal academy. In 1770 he removed to Great Windmill street, where he had built a house, in connection with which were a roomy amphitheater for lectures, a dissecting-room, and a magnificent room which was to form his museum, which consisted of anatomical preparations executed by himself and his pupils, purchases from other museums, also minerals, shells, and other objects of natural history, together with a very rare cabinet of ancient medals and coins.

An estrangement which took place between Hunter and his brother continued till the former was on his death-bed, when his brother requested that he might be admitted to see him. This was acceded to, and he continued to visit him daily, and to afford him professional assistance, until his death. Together with the bulk of his fortune, Hunter left his museum to Dr. Baillie for a period of 30 years, after which it was to be handed over to the university of Glasgow, to which institution he bequeathed £8,000 for its maintenance and increase.

Hunter excelled as a lecturer in clearness of arrangement, aptness of illustration, and elegance of diction. "He was, perhaps, the best teacher of anatomy that ever lived." He published several important contributions to medicine, of which the most important is his *Anatomical Description of the Human Gravid Uterus and its Contents,* which did not appear in its perfect form till after his death.

HUNTERDON, a co. in w. New Jersey, on the Pennsylvania border, traversed by three railroads and bounded on the s.w. by the Delaware river; 500 sq.m.; pop. '70, 36,963. It has a hilly and in some parts a mountainous surface, and the soil is generally fertile. The chief products are corn, wheat, oats, hay, butter, and flax. Co. seat, Flemington.

HUNTER'S POINT. See LONG ISLAND CITY.

HUNTING. The manner of conducting field sports has varied considerably at different periods. Formerly the term hunting signified the pursuit and destruction of wild animals whose presence was dangerous, or whose flesh was calculated for food. Now the word is often applied to chasing animals with hounds for sport or exercise. Xenophon tells us in a treatise on dogs and hunting that the art originated with Apollo and Diana, and asserts that the chase forms the best soldiers in the world; that it habituates men to cold, heat, and fatigue; that it kindles courage, elevates the soul, and invigorates the body; that it retards the effects of age, and renders the senses more acute; and finally that the pleasure which it affords is a sovereign remedy against all mental uneasiness. Aristotle wrote a treatise on field sports by order of Alexander the great, and Polybius relates that Maximus restored discipline in the Roman legions by often exercising them in hunting. Oppian distinguished himself by his poems on hunting, and several of the finest similes of Homer are taken from hounds in chase. The Romans at one time discouraged hunting among the upper orders of society, fearing it might become a passion which would divert them from their essential duties. But, aware of its beneficial effects in forming the people for war, they substituted the cruel and degrading exhibitions of animals destroying each other in an amphitheater. Yet we find many of their emperors encouraging hunting, and some of their best writers, such as Virgil and Horace, extolling it. The ancient Germans and Gauls were excellent hunters, and the ancient Britons had that ardent passion for the chase which has always been characteristic of England. The Anglo-Norman and early English monarchs were devoted to the art, and a code of laws relating to it was formed by one of the Welsh princes in the 12th century. We hear of fox-hounds first in the time of Edward I., and during the reign of his successor hunting in England may be said to have been reduced to something like a science. Edward III. was a great stag-hunter, and even while he was engaged in war with France, there were attached to his army

60 couples of stag-hounds and an equal number of hare-hounds. It does not appear that the fox was much in esteem for the chase by any of the Anglo-Norman sportsmen, and Somerville, in his famous poem, *The Chase*, does not treat him with the respect which he pays to the stag or the hare. Hunting, however, advanced steadily in all its branches, and flourished greatly during the last century owing to the encouragement given it by George III.

The higher kinds of game animals are now so scarce in the United States east of the Missouri river, that sportsmen can have little real hunting until they cross the Rocky mountains. In the vast area lying between that chain and the Pacific ocean may be found nearly every species of game indigenous to the North American continent. Among the latter may be mentioned the grizzly and black bears, the mountain sheep and goat, several species of deer, the moose, cougars, wolves, foxes, and many smaller quadrupeds. Of the entire area Montana, Wyoming, Idaho, Oregon, and Washington Territory are by far the best hunting grounds, as they possess all the necessary elements of soil and climate, and their population is yet small. Sporting dogs of all kinds can be utilized in every quarter of the country, but the most valuable are pointers, setters, and hounds. The greyhound can be employed in coursing hares and antelopes; the deerhound for following on open ground the elk, the moose, and the white-tailed deer; the terrier for routing foxes and badgers from their burrows; the beagle, harrier, foxhound, and other hounds are useful in certain kinds of hunting. The weapons required for the chase, in the west, are a rifle, a breech-loading shotgun, a heavy revolver, and a good hunting knife.

The hunter can estimate the size of the animals which he is trailing, by the spread of the feet on the ground; their weight, by the depth of the impression made; the speed at which they move, by the intervals between the paces, and the length of time since they passed over a spot by the freshness of the tracks. If an animal be seriously wounded, it may be detected by drops of blood, or by the irregular and straddling gait. All game quadrupeds should be hunted up wind, seldom across it, and never down it, as scent is to them what sight is to birds and feeling to human beings.
